A Multitusking Task

Univac customer engineer checks electronic equipment to be used by an October expedition reenacting Hannibal's crossing of the Alps with elephants in 218 B.C. The project is being conducted to gather information on the animals' resistance to cold, altitude and fatigue.

The elephants will have multichannel telemetry devices strapped to their hearts to detect heartbeats, body temperatures and brain activity. The data will be processed on a Univac 90/30 system.

Protects Federal, EFT Systems

Senate Gets First DP Crime Bill

By Catherine Arnst
Of the CW Staff

WASHINGTON, D.C. — The first piece of legislation aimed specifically at computer crime was introduced in the Senate here last week.

The bill would make it a crime to misuse the computer systems of the federal government, certain financial institutions and other entities involved in interstate commerce.

Punishment for violators of the proposed law would be a jail term of up to 15 years and/or fines up to $50,000.

The legislation's sponsor, Sen. Abraham Ribicoff (D-Conn.), attaches "great importance" to the penalty portion of the bill.

"Computer criminals are the most sophisticated of all white-collar criminals," Ribicoff said. "They currently operate in an environment and under conditions in which the successful detection and prosecution of their crimes is very difficult.

"When they are apprehended and convicted, all too often the sentences they receive are extraordinarily light," he added.

It is Ribicoff's hope "that these increased penalties, unprecedented in federal criminal law for white-collar crime, will deter the potential computer thief and at the same time pose a warning to all white-collar criminals that Congress sees white-collar crime as a threat to our society which should be dealt with in a manner befitting the crime."

EFT Protection

The bill also places emphasis on the prosecution of crimes against the computer systems of banks and other financial institutions that are insured or regulated by the federal government. The growth of electronic funds transfer (EFT) systems requires special protection because they are particularly vulnerable to criminal attack, Ribicoff said.

The proposal would guard against unauthorized access:

- To customer accounts by means of the theft or reproduction of an access key.
- To accounts by personnel manning access terminals.
- To communications lines between remote terminals and information storage areas.
- To the central processing site.

Existing laws are inadequate for prosecuting computer criminals, according to Ribicoff.

While there are some 40 sections under Title 18 of the U.S. Code that the government can apply to combat computer-related crime, all 40 were written for other types of crimes, he pointed out. Consequently, federal prosecutors have to "shoe horn their cases into already existing laws ... that did not envision the technical aspects of such crimes," he said.

The bill is a result of an inquiry begun May 10, 1976 by the Senate Governmental Affairs Committee, of which Ribicoff is chairman.

A staff report released Feb. 2 entitled "Computer Security in Federal Programs" demonstrated the government's inability to secure its 10,000 computers, discussed weaknesses in government procedures for predicting the integrity of its computer personnel and showed concern on the part of the federal law enforcement officials that the U.S. Code should be amended to strengthen the government's ability to prosecute computer crime.

It was noted in the report that a major computer crime conviction had been won in one case only because the perpetrator had used a telephone line to penetrate the computer system of a federal contractor across state lines. Had the telephone been used intrastate rather than interstate, the Wire Fraud Statute under which the indictment was brought could have been inadequate, federal prosecutors said.

In the same case, a part of the indictment was dismissed because electromagnetic impulses which transmitted data were determined not to be "property" as defined in the Interstate Transportation to Stolen Property Statute, Ribicoff said.

Ribicoff's bill would make all penetrations a federal crime, not just those acts perpetrated with a telephone or by other means across state lines.

Cosponsors of the Ribicoff bill include Senators Charles Percy (R-Ill.), Henry Jackson (D-Wash.), Lee Metcalf (D-Mont.), Edward Kennedy (D-Mass.), Strom Thurmond (R-S.C.), Robert Griffin (R-Mich.) and Pete Domenici (R-N.M.).

For Software Programs

Contu Unit Says Copyright Enough

By Don Leavitt
Of the CW Staff

WASHINGTON, D.C. — "The copyright law, applying as it does to all forms of expression, should be broad enough to shelter the works of Nobel laureates and computer programmers without causing any confusion about which is which."

With those words as the final sentence in its report to the National Commission on New Technological Uses of Copyrighted Works (Contu), the commission's software subcommittee left no doubt as to its basic belief.

Established by Congress late in 1974, Contu was chartered to study, among other things, the reproduction and use of copyrighted works on DP systems and to recommend changes in the law that seem necessary because of the use of such systems. The commission is releasing this report now for public comment.

The dramatic quality of the software subcommittee's words was triggered, perhaps, by the subcommittee's desire to overcome resistance to the idea it sensed on the part of the commission. A footnote early in the report claimed "certain commissioners are skeptical about the need for any form of protection for computer programs as well as the copyrightability of such works."

No such concerns face a subcommittee on computer-based data bases. The discussion in its report to Contu, also just released, "is premised upon the commission's agreement with the legislative intent of the new copyright law to afford copyright protection for computer data bases equivalent with the protection accorded compilations in traditional hard copy format," the committee said.

Between the footnote and the dramatic ending of the software report, the committee argued that authors of computer programs clearly have a right to protection for their work, that various other forms of protection — particularly patents and trade secrets — are not appropriate for software and that parts of the new copyright law scheduled to go into effect next year should be

Management Key to Future DP: Spangle

By Toni Wiseman
Of the CW Staff

WASHINGTON, D.C. — Management issues are more significant than technological concerns in improving the efficiency of DP activities during the evolution to advanced computer systems, C.W. (Clancy) Spangle said here last week.

"Those responsible for implementing tomorrow's systems must be concerned with the overall efficiency of the installation in an organization ... and how this is perceived by the organization," Spangle, president of Honeywell Information Systems, Inc., told attendees of the National Conference on Computer Systems Productivity.

"All of us in the profession need to do a much better job in reviewing and explaining the cost-effectiveness of our present systems. If we don't do a better job with today's systems, there won't be any tomorrow," he warned.

Spangle acknowledged that defining tomorrow's systems "is not an easy task because of the speed at which technology appears to be changing and because there seems to be some divergence of opinion within the industry as to what tomorrow's standards will be."

"Nevertheless," Spangle said, "I believe we can agree that the industry is moving more and more toward bringing the power and the variety of functions that a computer can accomplish out of the machine room and into a workstation where the transactional activity and the business actually takes place — thus making the power of the computer available to ordinary employees instead of just the computer professional."

The goal of these advanced systems "is to achieve increased individual productivity," he observed. But he noted, moving to these new systems can be accomplished only if the task is treated as a management issue rather than a technological one.

Senate Strikes 'Target'

By Nancy French
Of the CW Staff

WASHINGTON, D.C. — The Senate has voted to kill funds for the Veterans Administration's (VA) controversial computer claims processing system known as "Target."

About $17 million of the $21.9 million 1978 appropriation was struck by the Senate Appropriations Committee's Subcommittee on Housing and Urban Development — Independent Agencies chaired by Sen. William Proxmire (D-Wis.).

The $4,927,000 that remains will be used to continue the pilot project now under way in Philadelphia.

The computer system was proposed for use in servicing the files of 7 million VA beneficiaries who receive monthly benefits, pensions and

To Mitigate Confusion

Societies Urged as Vendor-Victim Liaison

By Don Leavitt
Of the CW Staff

WASHINGTON, D.C. — The professional DP organizations must become a truly effective "third force" to bridge the gap between the "vendors and the victims" of the uncontrolled growth of DP in this country, according to Dr. Herbert R.J. Grosch, president of the Association for Computing Machinery (ACM).

Unless the organizations step in effectively, the confusion of the DP community and the disappointments of the end users will continue to grow, Grosch warned attendees at the National Conference on Computer Systems Productivity here last week.

This leads not only to poor systems, but to such things as the "meaningless layers of software" including complex operating systems and "portable, high-level languages" now being implemented on minicomputers, he added.

Even though they often have limited resources, ACM and the other organizations that make up the American Federation of Information Processing Societies (Afips) must handle the dual job of advising users of what they might reasonably expect from systems and of helping vendors understand what the users need.

Only these groups are "intellectually free" enough to do the job, Grosch said.

User groups seem to fit into the gap between vendor and user, he admitted, but "they are often very vendor-oriented, on the one hand, and very concerned about the technical aspects of the products, on the other." They just aren't focusing on the bigger issues, he said.

Vendors don't really care about the users' desire and need for good systems. It is abundantly clear that various vendors have "suborned" the potential effectiveness of an original system to sell more powerful equipment, he charged.

Hope in Sight

But there is hope. Afips has recently opened a Washington office and, even though it's a small operation now, it's a start, Grosch noted.

It is a place where users can come for objective information and a place from which the professional DPers can perhaps make their views known to government policy makers, he said.

The organizations also have to reach out the other way, however, and get more DPers involved in their operations, according to Grosch.

ACM, he noted, has reached a membership of 35,000 and others generally are smaller. Overall, they now influence a very small fraction of the people really involved in DP in this country.

To broaden interest in their purposes, the organizations must, for example, make their publications more readable or create new publications for a wider audience.

In line with that thought, Grosch noted a feasibility study is now underway that may lead to the publishing by Afips of a "general interest" DP-oriented magazine called *Abacus* with funding from ACM.

The problems of the end users are perhaps illustrated best by the proliferation of "minis, micros and terminals" throughout the halls of Congress, Grosch said. The expectation seemed realistic — to tap information in the Library of Congress and the data bases available to the congressmen.

In practice, however, the users — congressmen and their staffers — struggle hard to learn how the systems work, after which they get "unformatted data from incompatible files, which they have to analyze themselves to get the information they wanted in the first place," according to the ACM leader.

FTC to Probe Credit Bureaus

WASHINGTON, D.C. — The Federal Trade Commission (FTC) has launched an investigation of computerized credit bureaus to determine if the information they maintain on consumers is accurate.

"The inquiry will seek to determine whether the bureaus are maintaining reasonable procedures to assure accuracy of information as required by the Fair Credit Reporting Act," the FTC said in a news release.

The agency refused to indicate which credit bureaus were under investigation, but noted the inquiry would be limited to "automated" bureaus.

"On the basis of information obtained, the commission will determine whether further action to enforce the Fair Credit Reporting Act on a nationwide basis is necessary," the FTC said.

A spokesman said the investigation was being brought as a result of complaints filed by individual consumers. The probe is expected to take six months to a year.

Depending on the extent of violations, if any, the FTC can make a public complaint against an individual company, propose a standard for operation or report to Congress with proposed legislation, the spokesman explained.

Management Key to Future DP

(Continued from Page 1)

Many users today have a very high-speed, powerful, latest generation computer which is not being used efficiently because it's doing exactly what was done in the past with the old machine, Spangle observed.

"On too many occasions people just do a surface conversion, don't use the new capability and continue running a big batch workload on a highly terminal-oriented interactive system that just doesn't run a batch workload as well as the old system," the executive said.

"Data processing technology already is far in advance of what is being realistically used and tapped. The very real problems are organizational, operational, logistical, human and political — in short, management issues," he emphasized.

Spangle said the real key to the success of tomorrow's computer system is in the quality of thought that goes into its design, installation and implementation, the level of receptivity that is created for it, and the degree of familiarity achieved by both the people who operate the system and the customers it serves.

Old-Fashioned But Good

Some of the old-fashioned solutions to management problems still are valuable in the most modern systems. Nothing beats proper training including — or perhaps starting with — training from vendors, Spangle said.

"But don't fall into the trap of thinking you can get all the training you need from vendors," he cautioned. "They won't tell you anything about your internal applications, your own workload that's on the machines or your own procedures.

"Remember that there is a body of training and documentation that you must do for yourself — and if it's not done properly the system will come down or be used inefficiently," he advised.

"It comes back to the premise that management of a data processing system is a process, not an event — it is always being tuned and improved," Spangle said.

SWEEPSTAKES

How did SyncSort do against IBM's new sort in OS? It was like one of those old horse-race movies!

Call (201) 568-9700

Have we got a sort to help pay off your mortgage!

When we ran our most recent sorting trials, you could almost hear the gravel-voiced Hollywood announcer saying

"Here we are, Ladies and Gentlemen, at historic old Benchmark Park for the 99th running of the famed OS and OS VS Stakes, the third of sort-racing's famous Triple Crown events.

"The sorts are coming onto the track now. There's IBM's highly touted young colt, with his jock clad in the software stable's traditional colors -- blushing pink and envy green

"Will ICEMAN 3 – out of old SM-1-5740, Release 2 – stage a comeback today? Will he be able to make up for his disappointing finishes in the earlier MVS and VS Classics? Only time will tell

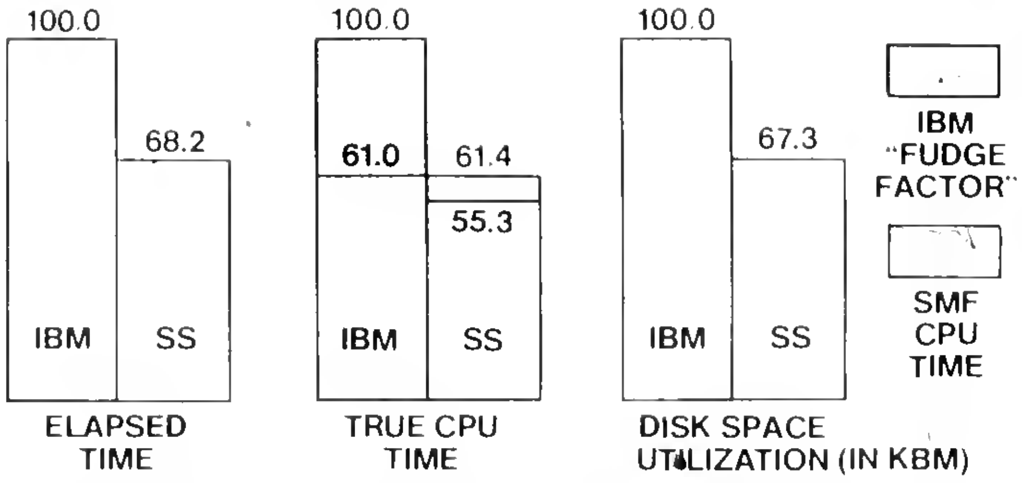
"Now here comes the 'Cinderella Sort' Whitlow Stables' SyncSort. As usual he's ridden by his owner and trainer, winsome young Shirley Whitlow

"How this tousle-headed youngster has struggled to train and develop this magnificent animal and bring him from dusty county-fair tracks to the bigtime of sort racing! Shirley is, of course, clad in the familiar Whitlow colors -- denim blue and tee-shirt white

Now they're at the post no sign of trouble ... and THEY'RE OFF!"

* * *

We're sorry, but after that everything reverted to modern *cinema vérité*. SyncSort breezed home first without even working up a lather. Here's how the results were posted on the flashing board at Benchmark Park:



Actually, SyncSort would have won by more lengths if it hadn't been for that old one-eyed race track judge SMF. As you probably know by this time being an experienced "improver of the breed" SMF records only a portion of the True CPU Time that a sort consumes

We refer to what's left over as the "IBM Fudge Factor." And you'd be surprised how often this gluey mass gets spread on race tracks!

However, we're not complaining. We never look a gift horse in the mouth

And that's definitely the way we think of SM1 5740, Release 3!

WHITLOW COMPUTER SYSTEMS Inc. 560 Sylvan Ave., Englewood Cliffs, N.J. 07632

Author Hersey Says Copyrights Meant for Art, Not Technology

By Don Leavitt
Of the CW Staff

WASHINGTON, D.C. — Computer programs should not be protected by copyrights, according to well-known author John Hersey, who disagreed with the majority of software subcommittee members of the National Commission on New Technological Uses of Copyrighted Works (Contu).

In a long paper distributed with the software committee's report, Hersey, a Contu member, questioned whether programs qualify as "works of authorship" and argued that protecting programs by copyright might have an undesirable impact on the national culture.

Hersey urged Contu to consider whether any additional protection for programs is needed. If it is, he asked the 12-member commission to consider a new form of protection outside copyright. A draft of a model statute, expressing that option, is attached to Hersey's dissertation.

In the body of his essay, Hersey stated emphatically, "Programs are different from the various forms of 'works of authorship' secured under the constitution by copyright."

Each program may be considered a writing of an author up to a certain point in its development, he acknowledged, but "beyond that point the same program is embodied in material form and becomes a *mechanical device*, which is engaged in the computer to become an essential part of a mechanical process.

"Thus the computer program is something strikingly new in our culture," he said, adding later that 'every program has but one purpose and use ... to control the electrical impulses of a computer in such a particular way as to carry out a prescribed task or operation. In its object form it does not describe or give directions for mechanical work. It does the work.

"A true writing has never before done work in this way — no matter how fervently many an author may have wished his words could 'do' something," he said.

Even if the first stages in the life of a program, when it is often in human-readable form, might be considered copyrightable without any change in the present law, the "working" stages cannot be granted that protection. That would preclude the possibility of copyrighting the whole, Hersey argued further.

Cultural Concerns

Moving to cultural concerns, the author noted the commission's view that "the dual purposes of copyright are the encouragement of creative work and the wide scattering of its fruits.

"The sanctioning of copyright protection for this new thing ... would, in this view, tend to dampen the first purpose. Its impact on the creative community would be bound to be discouraging ... this pollution of copyrighted 'writings' with units of mechanical work would affect not only the creators but also the consumers of the culture.

"The distinction is not between Nobel laureates and computer programmers [as the software subcommittee suggested in its report] ... it goes to the distinction between human beings and machines," he added later.

The draft statute provided by Hersey differs from copyright in one essential respect: It is drawn specifically to protect both the expression and the innovative ideas involved in the creation of computer programs, he explained. It establishes, he said, a "reserved territory" between copyright and patent, which has aspects of both but is neither.

The Hersey draft calls for a protection period of 10 years, which he said is "far more suitable for computer programs than the much longer term of protection of the copyright law. The 10-year term would give the innovator an edge without being so long as to deny the public the cumulative worth of the knowledge involved."

The draft includes the means by which rules can be adapted to the changes in technologies for operating computers "which are bound to have more far-reaching and wrenching consequences" than changes in the technologies of conventional copyrighted works, Hersey said.

Contu Asks Comments

WASHINGTON, D.C. — In publishing the reports of its subcommittees on data bases and on software (see Page 1), the National Commission on New Technological Uses of Copyrighted Works (Contu) also asked for public comment on the documents.

The commission will base its final report to the President and Congress upon response to the documents it said, as well as on further public hearings and the results of "several" studies now in progress concerning the economic, public interest and consumer questions associated with the issues before the commission.

Copies of the reports are available free from the commission. Request and comments on the reports — due by Sept. 1 — should be addressed to Arthur J. Levine, Executive Director, National Commission on New Technological Uses of Copyrighted Works, Washington, D.C. 20558.

The subcommittee reports were also published in the June 23 issue of the *Patent, Trademark and Copyright Journal*. Reprints are available for $5 from the Bureau of National Affairs, Research and Special Projects Division, 1231 25th St. N.W., Washington, D.C. 20037.

Unit Calls Copyrights Enough

(Continued from Page 1)

altered to clear up technical difficulties related to software.

Changes in the law are needed because of the way in which progams are used. Loading or inputting a program into a computer constitutes making a copy and, under present working of the law, copying is the exclusive right of the copyright owner.

One part of a new section of the law proposed by the subcommittee is designed to make it clear that inputting a program by a rightful possessor is not an infringement. Another part permits a user to make a copy of a program as backup protection in case something happens to the original copy.

But the subcommittee is aware of limitations in the protection provided by copyrighting even if the suggested changes are made in the law.

"It should be emphasized that the protection which would be afforded programs by copyright would not serve to block the use of a program's basic concepts by others since copyright never protects ideas, but only the expression thereof," it said.

Further, "when specific computer instructions, even though previously copyrighted, are the only and essential means of accomplishing a given task, their later use by another will not amount to an infringement," the report contended, citing a court decision related to use of a lawyer's copyrighted language as analogous.

Copyright protection for programs would "indeed be 'thin,'" the subcommitte acknowledged, "because in the programming field the use of specific language — instructions — may, in some instances, be so basic, essential and integrated with the underlying idea that use of the same language [by someone else] would not constitute infringement."

Although most programs have shorter useful lives than the full term provided by the copyright law — 75 years — there is no need to treat software as unique in this respect. "No one is harmed when short-lived works remain protected beyond their brief periods of utility," the report said.

Getting down to details, the subcommittee recommended that notice, deposit and registration regulations be promulgated by the Register of Copyrights. The fact that programs tend to be updated more frequently than other copyrighted material may lead to changes in the normal "deposit" rules, but these should be relatively minor, the software report added.

In its report, the data base subcommittee also faced the question of how the copyright law could be implemented with respect to big and ever-changing data files. Again, the answer seemed to be that the law as it stands could handle the job fairly well.

Largely because of the constant change inherent in computerized data bases, the group urged the Register of Copyright to work out rules that would allow the deposit of the complete data base at the time of original copyrighting, but permit updating through submission of "identifying material" rather than actual copies of the "new" data base.

Funding for Target Voted Down

(Continued from Page 1)

education payments.

When fully operational, the $122 million proposed system will comprise a central computer system and three regional centers as well as 79 minicomputers and 2,500 terminals spread throughout the VA's local offices [CW, May 2].

Despite the Senate action, all or part of the funds may be restored in conference between members of the House of Representatives and Senate when they convene the week of July 11, according to a Senate spokesman, since the House earlier approved the full request. The measure was defeated for a number of reasons, he noted.

First, the benefit/cost ratio got worse and worse, the spokesman said. For every $1 spent, only $1.19 would be saved, according to the VA's projections and then only as long as the VA stayed on its implementation schedule.

Secondly, the size of the project seemed "unduly large" since the workload of the system continues to decline, particularly in the area of Veteran's educational benefits.

Further, at the time the Senate acted, the VA still hadn't developed a comprehensive plan that identified all the critical tasks to be accomplished under the project, he said. The VA "rushed up" a critical tasks list at the last minute, but its effort came too late for consideration, he indicated.

The VA is "hopeful" that funds will be restored in conference, according to Bill Martin, under whose department the proposed system would be operated.

"However, if the Senate vote prevails, Target is effectively destroyed because the request for proposal would have to be withdrawn and we'll have to go through the entire [procurement] cycle again," Martin, chief data management director, said.

Martin said the VA has responded to a General Accounting Office report that was critical of several aspects of the Target system's development, in a report that has yet to be officially released.

"I think we have adequately dealt with all those issues raised," he added.

INDEPENDENCE From 1401 EMULATION

End the tyranny of emulation and step out smartly with C-S TRAN.

Your Early American 1401 object programs can speak contemporary COBOL to IBM 360/370, RCA, or UNIVAC. C-S TRAN produces operating COBOL programs that are:

Windy City Programmer Wins Code-Off in Big D

By Nancy French
Of the CW Staff

DALLAS — A Chicago man topped the field of 47 entries in the first "programming tournament" held here recently in conjunction with the National Computer Conference.

The contestants in the four-round affair included high school and college students, but most were entrants drawn from the ranks of professional programmers and were selected from 65 original entrants based on programs they had submitted.

First prize went to William T. Bailey, a programmer/analyst for Standard Oil of Indiana in Chicago. Second place went to Saul Rosenberg, a programmer and "general troubleshooter" for Riverside Research Institute of New York.

Third prize was won by Thomas M. Bogner, whose most recent job was instructor at Jamestown Community College in Jamestown, N.Y. The fourth prize winner was Bernard M. Chester, manager of computer resource OR/MS at Dialog, Inc. of New York.

Fifth place went to William A. Sherertz, chief systems programmer for Blue Cross/-Blue Shield of Michigan in Detroit.

Each of the four rounds was designed to test one particular programming skill, according to Ed Rodriguez, associate professor of computer science at East Texas State University, who, as NCC special activities chairman, ran the tournament.

In Round One, the 47 contestants who started were asked to complete a general multiway merge on the program each had written as contest entry so that it could handle duplicate keys. Contestants were allowed one hour to study the problem and two hours work on a terminal; 25 contestants were eliminated.

In Round Two, the 22 remaining contestants were asked to debug a data validation program containing logic errors. The same amount of time was given as in Round One.

In Round Three, the nine remaining contestants were asked to modify a program they had not written. The task was to generalize a poker hand evaluation program to permit any number of players and implement a discard and drawing new card feature. Again, one hour of study time and two hours of work time was allowed.

In Round Four, the six remaining contenders were asked to write a program from scratch — to produce frequency tables for cryptographic analysis of a coded message.

One hour of study time and three hours of work time was allowed.

The contest was run on the Dallas Independent School District's Time-Sharing Service, based on a Burroughs B6700. Terminals were donated by Computer Devices, Inc., Anderson Jacobson, Texas Instruments and Telex Corp.

As first prize winner, Bailey was awarded a TI Silent 700 Model 745 terminal, $500 worth of time-sharing services from Tymshare, Inc., a two-year subscription to *Personal Computing* magazine and a plaque commemorating the win.

Second prize winner Rosenberg won a Hazeltine Modular I CRT terminal and a one-year subscription to *Personal Computing* in addition to a plaque.

Third prize winner Boger won a Computer Automation, Inc. Naked Mini with LSI4/10, a one-year subscription to *Personal Computing* and a plaque.

Chester, as fourth prize winner, won an Informer Model D77 CRT terminal, a one-year *Personal Computing* subscription and a plaque.

For coming in fifth, Sherertz won Datapro Research Corp.'s three-volume Datapro 70 Information Service, the subscription to *Personal Computing* and a plaque.

Semifinalists won such prizes as a one-year subscription to *Computerworld*, NCC proceedings and a choice of books from Prentice Hall.

Two Univac Managers Accused of Using DP For Fraud, Conspiracy

PHILADELPHIA — Two program managers have been indicted for mail fraud and conspiracy while allegedly using computer time without the knowledge or consent of their employer, Univac.

David E. Kelly and Mathew Palmer Jr., the two charged with the crime, set up a music rearranging business last year, called Camps, Inc., and solicited nearly 70 companies for business.

The two programming managers allegedly used nearly $144,000 in computer time and storage from Univac facilities, the indictment charged.

Allegedly using a Univac 90, the two were able to revise music into digitized form, selectively edit the music and print out any desired format, according to a spokesman for the Federal Bureau of Investigation (FBI).

The men have been charged with five counts of mail fraud and one count of conspiracy.

Mail fraud is a common statute used in these cases, the FBI spokesman said. "It's a tried and true federal law whereas there is no specific state or federal law for computer cases."

The indictment stated nearly 417 music programs were stored using a CPU, terminals, operators and three-fourths of the allotted storage time given to Kelly's group. Univac would not comment on the case.

Both men are represented by J. Shane Creamer, former district attorney for Pennsylvania, and have pleaded "not guilty."

If convicted, each could be jailed for up to 30 years and fined up to $15,000. No trial date has been set.

IN BUSINESS:

"SDM/70 is the best development methodology we have seen. We have had nothing but rave reviews from staff *and* users."

Louis Choffe Director MIS
Standard Brands of Canada Ltd Montreal

In Lou Choffe's opinion, what sets SDM/70 apart from any other methodology is the all-important involvement of users at the front end of a project. "For the first time, the user is talking about 'his' system, and means it!" Lou says. Lou is one of a number of DP managers who have concluded that Systems Development Methodology/70 is the most complete methodology available today. Here are some of the others:

In the world of banking— SDM/70 can significantly improve the effectiveness of systems and programming We appreciate the fact that it covers maintenance work as well as new projects

Rodney C Greene Manager Systems and Programming The Idaho First National Bank Boise

In municipal government— SDM/70 is everything you say it is It has helped us increase staff effectiveness 40 to 50%, and we have been getting true user involvement since we installed SDM/70"

Norman Scott Supervisor Systems Programming City of Detroit

In computer services—"SDM/70 is extremely easy to use and implement Its flexibility allows us to match the level of effort to the size of the project

Al Muirhead Manager Systems
R Angus Computer Service Edmonton Canada

In business—"With SDM/70, we have the option to select the best technique that fits a given project The inclusion of HIPO, structured programming, walkthroughs and inspection keeps our staff current with the latest technology

William C Rudd, Manager Development and Support Morton Norwich Products Chicago

The SDM/70 structure includes five components: Methods guidelines that describe how each task of a given phase is to be performed; documentation guidelines that describe how to prepare the documentation for a given phase; forms guidelines that describe how to complete the SDM/70 forms; estimating guidelines that describe how to estimate costs and schedules for the project (5 to 10% accuracy is now a reality), and administrative guidelines that describe how to administer and control the project activities.

SDM/70 is a product of Atlantic Software, creators of PC/70, a leading project/resource management system. To find out how SDM/70 can help your organization create information systems that satisfy user requirements, call or write today.

Wisconsin Levies Software Tax Despite Revenue Overestimation

By Molly Upton
Of the CW Staff

MADISON, Wis. — Gov. Patrick J. Lucey last week signed into law a budget bill that levies a 4% sales tax on DP services, despite the fact the Wisconsin Department of Revenue overestimated by about 56% the revenue yield from such services.

The tax goes into effect Aug. 1.

Nick Nichols, deputy secretary of the Department of Revenue acknowledged in a memo to State Rep. Gary K. Johnson, cochairman of the Joint Committee on Finance, that the revised estimate of the revenue yield from the tax is $9.9 million rather than $17.5 million.

The overestimation, pointed out by Michael Zeidler, a computer consultant [CW, June 13], stemmed from including as a basis for revenue calculations the $3.7 billion in revenues state officials thought mainframers received for services in 1975.

This figure should not have been included in the calculations since it represented estimates of the entire DP industry, Nichols pointed out after questioning International Data Corp., a research firm, on this point.

Although the Legislature considered several motions to delete this provision from the governor's budget proposal, the lawmakers decided to include it, primarily for reasons of consistency, according to State. Rep. R. Michael Ferrall, assistant majority floor leader.

The sales tax law currently applies to "some but not all sales of computer and DP services," Ferrall wrote in a letter to Zeidler.

"This situation may lead to confusion as to what is and what is not taxed. This proposal would impose the sales tax more uniformly on DP services," he added.

Furthermore, "some aspects of computers services are similar to forms of data transmission which are presently subject to the sales tax such as telephone and intrastate telegraph services," he pointed out.

DP-Based Toxin Tester Gets Patent Office OK

WASHINGTON, D.C. — A computer-based instrument designed to instantly identify toxic substances in fluids and thus save the lives of victims of poison or drug overdoses was patented here recently.

The "video fluorometer" was invented by James B. Callis and Ernest R. Davidson, both of the University of Washington in Seattle.

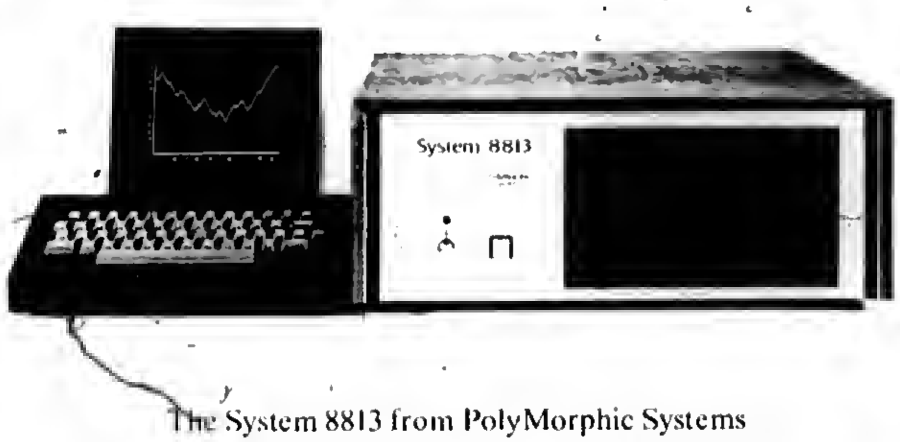
The device, which is based on fluorescence spectroscopy — the study of light emitted by an excited sample as it luminesces — is said to be able to profile a complex substance in .017 of a second.

The system works by first amplifying the light from an excited sample with a low light-level television camera. The camera signal is processed by a computer and displayed on a video screen as a three-dimensional graph or topographical display.

The substance is identified by matching the pattern created by the chemicals in a sample with chemicals stored in the computer.

In addition to its obvious use in the medical field, the system could also be applied industrially where quick analysis of unseparated substances is needed, such as substances involved in oil spills, according to Callis.

The computer you can call your own.



The System 8813 from PolyMorphic Systems
is a complete, powerful problem solver in a walnut cabinet. This
microcomputer allows you to quickly formulate and solve
sophisticated financial, scientific, and engineering models
from the convenience of your office or den.

The English language commands of our disc BASIC
programming language permits easy use of our video graphics
and disc files. Complete systems are available as low as $3250.

At BDS, we're supplying two alternatives to your standard line printer systems. Our products are centered around the DataProducts Model 2470 and 2550 CHARABAND printers.

Our B-70 Model is one that you're probably already familiar with - - - Burroughs calls it the B9246. It's a high-speed 1500 - 1800 LPM drum printer.

The BDS B-50 Model is the latest in horizontally moving font devices offering the user superb print quality with two character sets standard.

Even better is that our BDS line printer systems can operate with most Burroughs mainframes from the B1700 series through the B6700 series. You provide the imbedded Burroughs buffered controller and cables and the BDS B50 or B70 system will plug directly into your cable end. It's that simple! We also provide 300/600 or 900 LPM alternatives.

To top off a great line, we can give you a great deal: Both our BDS B50 and our BDS B70 sell for only $32,000 each. We can provide maintenance agreements in over 50 U.S. cities coast-to-coast. And we deliver in 30-50 days!

The Alternative to Burroughs

Reduce costs and improve line printer throughput

So, if you're considering a new system, or a replacement give us a call – San Francisco: (415) 326-2115, in Los Angeles: (213) 887-5240. Manufacturers Representatives Inquiries Invited.

School Reduces Consumption by 22%

DP Monitor Gets High Grades for Controlling Energy

By Ann Dooley
Of the CW Staff

FORT LAUDERDALE, Fla. — South Plantation High School here learned it could reduce its energy consumption by as much as 22% per month in an experiment with computer control.

Electricity bills had reached $5.2 million in the city schools last year and officials wanted something done about that.

So, the Broward County school board and the city of Fort Lauderdale set up a computer monitor in a few city buildings and one school to determine how much money would be saved under a computerized system.

Based on a Data General Corp. Nova 2, leased through Automated Data, Inc. of Miami, the control system delivers power only to areas of a building where it is needed.

Instead of turning the air conditioning on hours before the students arrive, the computer was programmed to activate the cooling system at the latest time possible without causing any discomfort to the students when they come in, according to Mario Gutierrez, the school board's mechanical director.

The system also shuts off the air conditioning for a few minutes every hour. The shut-off period is not long enough for the rooms to warm up noticeably, but it does save on electricity output significantly, Gutierrez said.

In addition, the computer is programmed to be aware of what rooms are empty during a lunch period or other hours during the day and to regulate the temperature accordingly.

Cooling Monitored

Previously, the air conditioning would run until the janitor finished cleaning all the rooms, Gutierrez said. "In essence, we were cooling off rooms at 3 p.m. that weren't going to be cleaned until 10 p.m. that night," he explained.

The present system allows each room to be cooled for set amounts of time, but only when the room is in actual use, he added.

"We had to work together very closely with the school to find out [its] schedule and coordinate everything," Gutierrez said.

"It took about 10 days to get the building in shape for the computer," he said. Equipment had to be adjusted and made compatible with the computer link.

Then, everything had to be analyzed to determine what kind of power load had to be controlled including the distribution of the power going to the air conditioning system, exhaust fans and equipment maintenance systems, he said.

Conservation 'Critical'

At South Plantation, the air conditioning was found to account for about 55% of an average $10,000 monthly electric bill.

The need for energy conservation is "critical", according to Jack Moss, county commissioner. Moss said he intends to ask the commission to fund an energy management survey of electricity use throughout the county buildings.

Exact figures on energy consumption at certain city buildings are not available, according to Moss. But based on the performance of Automated Data's system and others like it, "we could save at least 20% of our electricity bill by hooking major equipment into a computer," he said.

Savings Pay Expenses

The reduced electricity bills will pay for Automated Data's expenses within 20 months, according to James Buening, vice-president for that company.

Automated Data has worked mainly with hospitals and hotels in reducing energy consumption, and the Fort Lauderdale buildings are its first attempt at public buildings.

Although the company sells a stand-alone energy management system, Fort Lauderdale officials are leasing a Nova 2, located off-site. The system is linked via phone lines to a remote control panel unit at the school and city office buildings.

Panel Controls Usage

The control panel has 24 control points that regulate the energy usage. It receives and decodes signals sent from the Nova 2 and activates or deactivates energy at any certain area.

The panel can also generate signals back to the Nova to indicate the electrical status at any moment. The entire system can be overridden at any time and operated on a manual basis, Gutierrez added.

In Florida, air conditioning is a major source of consumption, but the computer also regulates the elevators, hot water tanks, intake fans and parking lot lights, he noted.

How to get a bigger CPU (without getting a bigger CPU)

The trick is in your COBOL programming. Whatever IBM 360/370, OS, OS/VS system and compiler it comes out of, it comes out fat. Unnecessarily fat, however efficient the program.

OPTIMIZER II solves that. Using techniques inaccessible to your programmer, your compiler, this software package automatically trims that fat. Without source program, compiler, system changes of any kind.

End result: an average of 10% less CPU time on every program optimized (not to mention 20% less storage).

A significant reduction, to be sure. But most of the 500 OPTIMIZER II users see it as a significant expansion. See?

Data Retrieval Calmer Without COM for Patent Office

By Esther Surden
Of the CW Staff

WASHINGTON, D.C. — Although the resident experts said "it couldn't be done," the U.S. Patent Office has solved a mind-boggling data retrieval problem that involves accessing a data base of "about 12 million patent documents in 95,000 subclasses." The solution was switching from computer output microfilm (COM) to a minicomputer.

"It is very important for the patent office, patent attorneys and the general public to know where a particular patent is classified," Jeffrey L. Forman, director of the Documentation Practice and Systems Division, said. "Making that information available has not always been easy."

However, the number of documents and subclasses in the patent office files is just the tip of the iceberg, Forman explained. The classification system is a dynamic one with approximately 600,000 documents . . . reclassified into new categories each year. Thus the classifications printed on the front page of each patent when it is issued cannot be relied on to reflect the actual status of that patent, he said.

Prior to installing the minicomputer, the patent office had maintained three separate files. Information on patents in a subclass could be obtained either from microfilm or in the form of a paper listing made from a weekly run of the files maintained by the patent office's Office of Computer Services, Forman explained. The classification of a particular patent number could be obtained through a "minicomputer-controlled microform display," he said.

In addition, two master sets of files were maintained — an examiner's search file that contained "unofficial cross-reference" patents (patent copies that, over the years, examiners have placed only in their own search files) and the public search room file.

Getting information on patents in a subclass from microfilm required determining which one of an 11-reel set contained the desired subclass and then searching that reel to find the subclass. The list of numbers for that subclass and notation as to whether the patent was an original or cross-reference were displayed in a dense, hard-to-read format that could only be run out on low-quality paper, Forman said.

The subclass listing run was on good, readable paper but it was not time sensitive enough, he added.

Retrievat System

The microform retrieval system, used in the public search room and to respond to in-house telephone inquiries, was a minicomputer coupled to a microform display. Users keyed in a patent number and the COM system retrieved microfiche, positioned to the correct dot on the strip. This fiche area, however, contained 100 patent numbers and classifications and was hard to read. It also suffered from mechanical breakdowns. Updating the system was time consuming so it was frequently out of date, according to Forman.

The experts at the Office of Computer Services told the documentation division that the files were too large to be accommodated on a minicomputer. However, the division continued its quest and came up with a viable system, Forman stated. "We relied on contractor personnel who are more expert to bring different systems to our attention," he noted.

The office chose a system based on a Four-Phase Systems, Inc. minicomputer with custom software developed by Commercial Software Systems Corp.

"One of the major factors in the equipment choice was the disk capacity that could be made available to us. We have to be able to take the master file and load it into the system in two different sequences," Forman noted.

The IV/70 processor acccommodates 120M characters of disk storage. Seven remote CRT terminals are tied to the mini.

"As an examiner or classifier tells the patent index person the patent for which he desires classification information, the patent index person keys that number into the terminal," he said. A readable display shows the patent number including the alphabetic subclasses in which it is classified in the examiner search file. This was the first phase of implementation.

Wider Information

Implementation of another phase of the system enabled the office to key a class and subclass into a terminal and get a screen display of all the patents in that subclass. The display also indicates whether the patents are originals or cross-references in that subclass.

The patents are displayed in pages of 15 patents, starting with the most recently issued, and the user can move to the next page or any desired page by keying in a number, he said.

The system also produces subclass lists, a function taken over from the large-scale patent office computer, he said.

All classifications are stored in an abbreviated address code form. "Therefore, each time you key in a patent number, the disk is being used not only to locate that patent number and its coded classifications, but also to retrieve the formatted class and subclass corresponding to each of the address codes," Forman explained.

"A terminal user interacts with the system under program control with messages and prompts displayed on the CRT," the software vendor said. "The system checks all keyboard input, diagnoses errors and allows rekeying if necessary. Because a separate copy of a program is loaded into the processor's memory for each user, different users can select the same or different capabilities. Only the required program elements are loaded."

The operating system features dynamic program relocation, enabling different sized programs to share memory, the company added.

Raytheon Funds Scholarship At Tufts to Honor Marshall

MEDFORD, Mass. — Raytheon Co. has established a scholarship at Tufts University here in honor of Dr. Laurence K. Marshall, a founder, president and chairman of the company.

Income from the grant will provide financial assistance to a student in the College of Engineering who has achieved academic excellence and who has demonstrated interest and accomplishments in other fields of study.

Raytheon was first conceived by Marshall and Charles G. Smith in a discussion on the Tufts campus 55 years ago. The third founder was Dr. Vannevar Bush, a roommate and 1911-classmate of Marshall at Tufts.

Attention: Business Computer Distributors

Don't sell your customers just another computer...

when you can select from the most comprehensive family of business computer systems ever offered...

The SYNERGIST™
BUSINESS SYSTEMS

Start with the broadest choice of business systems ever offered. From a small business mini, to large shared-resource computer networks. Using the industry's most reliable, best price/performance computer mainframe. The Digital Computer D-116, already proven in over 10,000 installations.

Add the broadest line of disk systems, CRT terminals, workstations and printers. Designed and tested to operate together in nearly limitless combinations.

Add operating systems. Application libraries. Software support and our unique Executive Inquiry System, "EIS".

Training programs and maintenance support. Developed through years of business computer experience.

Put it together with one company responsible for system engineering, compatible operation and reliability.

End up with systems with a difference. Systems that can be scaled up without expensive reprogramming. That can start small without future penalty. With big system features. Like plain English requests for special reports. Text retrieval systems. Confidential file security. Spoolers. Editors. Performance at every size level at a price more businesses can afford.

We're still adding the most important part. The smartest, best managed distributors in the business. It's the final link that makes our systems work. If you're the link we missed, write, or call Ronald S. Harvey, Business Systems Sales Manager, 201-575-9100.

Ask about our "Master Distributor," "Private Label" and "Dealership" programs.

We're Digital Computer Controls, Inc. The company that other computer companies call *their* computer company.

Take advantage of the most profitable distributor plan available for the small business computer market. You'll find Randal offers the highest gross margins — from system number one on. And no quotas, billbacks or other hassles. You won't find us competing with you — we only market through distributors, so your success is ours.

Never before have your potential customers been able to buy as much reliable office computer power for such an incredibly low (Randal systems start at $12,750) price. Every system is available for 60 days — or less — delivery and priced lower than any comparable competitive models. Plus, you can stop worrying about training — ours is continuous, or service — ours is nationwide.

Randal Data Systems has the broadest family of software compatible small business computers and an extensive application software library. Just as important, our Business Basic makes it extremely easy to program.

Maybe that's why we have the fastest growing independent distributor network in the nation.

Call us today or send coupon for details.

Randal wrote the book.

The Waves of Change

By Charles P. Lecht

What does tomorrow hold for today's users? Lecht believes it holds design changes that will make system architecture more adapted to end users and problem solving. This week, in the latest excerpt from his soon-to-be-published book, Lecht discusses what those changes will be in the early 1980s and how IBM will incorporate them in its next generation, the System/80.

CHAPTER VIII

Future data processing hardware is expected to be more specialized and significantly more modular than it is today. "Generalized" local hardware components (common system building blocks) will be *dedicated* (i.e., distributed special-function units) for communications, computation, control functions, data-base management and for other specialized tasks.

These specific task-oriented modules or process engines will be dynamically combined according to application processing requirements, interconnected and linked via software and firmware to form the system.

Moreover, remote distributed functions and processing networks (as contrasted with local distribution) will permit various users to control their own local equipment, but a central DP staff must still have responsibility for development, maintenance and coordination of the corporate DP strategy, corporate data base and general (interdepartmental) applications software and standards.

Processing will move out closer to the end user; if one processor or engine fails, the entire organization will not be brought to a standstill.

Systems will be simple and easier to use in this more remotely distributed environment. The user will be able to focus more on the desired logic and solutions than on the processing techniques needed to achieve them.

The major systems suppliers will create a data base/data communication environment in which users have greater control of their data and develop their own special uses for the data; however, in the full function of data base management, data must be carefully characterized either as a corporate resource or only locally meaningful.

As a Future Requirements Study recently presented by the Guide (IBM 370 users group) Future Division put it, "Management is crying out for DP systems which are more usable. Managers like to manage, and they feel uncomfortable with present-day DP systems which are so complex that they defy understanding . . . defy management . . . we can look for users to be more knowledgeable, more demanding and much more involved in specifying the systems from which they derive benefit." New applications should soar when the end users become more involved.

"User-oriented" systems will require changes in the traditional design of computers. The data management function, or "system resource repository and controller," will become the focal point of the system or network of systems, and the processors (CPUs) will play a more "peripheral" role.

"Problem solving" systems will evolve in such a way that hardware and software details or idiosyncrasies become unimportant to end users.

With high-speed, broad bandwidth data communications available, the system itself will determine how and where processing is done and storage maintained. Operators will make fewer decisions as "secure" operating systems take complete control of the system resources.

Ease of use is perhaps the No. 1 objective. Innovative and complex software, firmware and hardware structures will be required to attain and support this objective. Hardware and software will be strongly interrelated as users become more and more dependent on the systems to assist or guide them in the solution of even the most mundane problems.

Two Network Approaches

Under the network concept, "intelligence" will be available in peripherals and terminals, as well as controllers and processors. (Terminals provide multiaccess capability to a computer network. Even a sensor may be considered a terminal since direct access to a computer is provided.)

Figure VIII-1 depicts the current, "traditional" machine organization. All parts of the system are clearly identifiable by the user. In the network systems of the next decade shown in Figure VIII-2, the user has access to a limited number of terminal devices. The balance of the hardware and the communications capability becomes essentially transparent to the users. Communications linkages of varying capacities connect the various nodes of the network.

Another approach to a network is shown in Figure VIII-3. Here, regional centers control several local centers. Data banks for general-purpose use are concentrated only at the regional centers, with broadband communications links between these centers.

The local centers are connected to the regional station via remote job entry stations and terminals. Local centers thus become satellites to the larger regional operation.

Such an organization of systems/capabilities permits a decentralized system to have some of the advantages of centralized, concentrated data bases. It should be emphasized that although remote subsets of data bases or special, unique files are available at the terminals, our judgment is that it will be impractical and inefficient to decentralize the *total* corporate integrated data base by as early as 1980.

The distribution of total corporate data bases will not generally be realistic because communication costs are still too high; large disk files will remain relatively expensive; and concurrent file updating and maintenance is too complex in a distributed data base environment.

In addition, data base security and privacy can be more easily implemented and controlled if the sensitive corporate data base is distributed over fewer locations.

Future System Architecture

More on-line, communications-oriented, transaction-oriented and real-time systems will evolve as these systems become easier to use, as privacy and security concepts are proven and as systems become more reliable and dependable.

Systems of the 1979-84 period will exhibit such characteristics, although their growth will continue to be restricted by AT&T communications tariffs and line inefficiencies (until AT&T can fully implement digital networks, or until IBM communications satellites and private branch exchanges [or PBXs] become operational).

In short, system architecture in the early 1980s will be more adapted to end users and problem solving. One can anticipate that IBM's System/80, along with systems developed by other major innovation-minded vendors, will exhibit the following charac-

(Continued from Page 11)

teristics in support of end-user objectives in the coming decade:

1. *Distributed special-function processors:* Instruction stream processors (IP), file processors (FP), media processors (MP), communication processors (CP), sensor or event processors (SP) and a supervisor processor will be provided. Special array or vector processors and essential emulators will also be available.

2. *Interpretive processing capability:* For the program development environment, high-level microprogrammed IPs which execute source code (such as PL/I, Cobol, Fortran and APL) directly will be provided. "Standard" native mode IPs will also be available for the more performance-conscious, production-oriented users. (We already see examples of this interpretive processor or "engine" with the IBM 5100 and APL assist feature for the Model 148.)

3. Multiprocessing: Multiple main IPs will be supported and each process engine will be adapted by read-only memories (ROM), programmable ROMs (Prom) or writable control stores to execute a particular high-level language subset or superset. The non-interpretive, native mode IPs will execute in-line code at internal speeds which are approximately four times current performance levels.

Merged transistor logic (MTL), also known as MPT, with propagation delays approaching 5 sec or 50 nsec at the 1K device level, will likely be used to achieve these speeds.

4. *Memory hierarchy:* most process engines should utilize their own private high-speed cache (buffers) as well as up to 256K characters of integrated main memory, and all engines will be able to share a larger (over 100 million characters) secondary or bulk MOS storage.

(In this context, it should be noted that "bytes" has been dropped from most IBM 370 documents, and the System/80 "character" may be defined on a dynamic basis, i.e., consisting of 4, 8, 9 . . . n bits depending on the function to be performed.)

Backing up the shared MOS memory will be bubble storage. All four levels of storage (i.e., Cache, MOS, bulk MOS and bubbles) will transfer data blocks or pages automatically, probably based on a "hard-wired," frequency-of-usage replacement algorithm.

5. *High-speed, wide band bus:* All the local system resources and process engines will exchange data and communicate with each other via a unique wide band, multiaccess bus. The characteristics of the main bus are uncertain at this time, but IBM and other vendors are known to be working on "fiber optic" I/O techniques which use a solid-state laser source.

6. *Input/output interconnection:* A single multiplexed wire (coaxial cable) or loop (dual loops will be optional for redundancy) operating at very high speed will replace today's numerous cables. This loop system will also permit moving more intelligence in-board, in effect replacing the "channel" function with special integrated I/O processors.

Functional Overview

A conceptual diagram illustrating the probable structure of System/80 with all the distributed special function elements is shown in Figure VIII-4. (Note that names given to a particular "box" are my own labels. Obviously, IBM's specific model numbers will not be known until announcement time.)

This represents a radical architectural departure from previous general-purpose 360 or 370 designs. However, from the standpoint of the user software interface, the architecture would appear to be upward-compatible.

The "process engines", e.g., APL, Fortran, Cobol and PL/I, are microprogrammed and interpretive; i.e., they can execute source code (except for the native mode, 370 and Fast Fourier processors which may represent more tailored or optimized engines).

In our conceptual view, System/80 would function approximately as follows: jobs are submitted locally or remotely via card readers, diskettes, consoles or terminals to the *media processor* or through the *communication processor* (and passed on to the media processor) for preprocessing.

During this preprocessing, workload queues are created; required system resources are schedueld; data files are requested; and data relationships are established within the outboard data manager (ODM), or "system resources repository," and the particular interpretive processors (for development work) or native mode processors (for production work) are allocated as required.

When all the necessary system resources

are queued or scheduled, the job streams or tasks are sent to the *basic system memory* (BSM), i.e., the common, sharable memory, to await execution. As the required special-purpose or native process engines become available, tasks are blockloaded from BSM to the faster, private process memory (this memory will probably be 10 times faster than the BSM).

All required library routines, files and data relationships at this time have already been established and prestaged onto more efficient BSM or (if necessary) to bubble storage *prior* to the actual task execution step. At this point the main process engines (Cobol, PL/I, etc.) will execute the tasks to completion.

Should higher priority activities or real-time events interrupt task execution before termination, then the entire task and its status is temporarily swapped back to BSM for later processing and eventual termination.

If the current system workload mix is primarily application development-oriented, e.g., Cobol, then some or all of the process engines could be loaded by the supervisor processor with "Cobol micrologic," which is optimized for program development, testing and/or debug analysis. (In other words, the system *dynamically* adapts its resources to the current workload.)

In many situations, tasks will not require any allocation of native or interpretive processors at all; examples include file maintenance, extraction, reporting or inquiry. In this case the ODM, media processor or communication processor (three functions which, in fact, may be combined in a single box) will be able to handle such tasks without interrupting the main process engines.

We can find some examples of this off-line special-function engine capability today in the IBM 3850 mass storage system control design.

This dynamic adaptation and linkage of resources (logic, control storage and microcode, main memory and I/O devices) to suit the particular process load is substantially different from current-generation, general-purpose time-sharing or multiprogramming concepts. The special-function, locally distributed engines provide dedicated resources for each type of task (this does *not* preclude reentrant or concurrent use of specific resources) and do *not* attempt to interleave this task with other different tasks.

For example, a Cobol and Fortran compile process would not coexist or have to be multiprogrammed within a single engine.

Another major type of "process engine" may be what I would call the "macro processor" that is optimized for execution of production-oriented, native machine code. After source programs have been fully checked out using the interpretive processor(s), software (compilers) would be optionally available to convert user programs to native object code.

Naturally, many jobs, especially in a university or research environment, are one-shot types which may never need to be converted to more efficient object code. Array processors or Fast Fourier analysis "engines" represent another form of specialized, microcoded processors which execute object code.

Potential Advantages

Some of the potential advantages of the above-described System/80 conceptual design include:

- The distribution of supervisory functions — the special processors may simplify operating system control requirements and reduce overhead.
- Better system balance and resource utilization because of the system's automatic "adaptive" characteristics.
- Increased overall performance because of hardware or firmware (microcode) implementation of many frequently used software functions.
- Improved system security and integrity capability arising from functional isolation.
- Simpler and easier data access, since the system resource repository or ODM handles most data requests and relationships.
- Highly modular design for future expansion and growth; e.g., additional IPs, CPs, ODMs and SPs can be added as the workload increases in smaller steps.
- More cost-effective redundancy ("fail-soft") capability.
- Easier conversion via interpretive processors and emulators.

How will the IBM System/80 be packaged? One possible structure is illustrated in Figure VIII-5, where everything is integrated in one total package. The advantages of this packaging include lower reproduction cost; more difficult plug-compatible replacement of individual components; and lower space requirements.

System Software

The System/80 operating system will pull the various hardware, microcode and software elements together into an efficient "information-processing system." The software for System/80 is the key to the reorientation in systems thinking. The major

The Waves of Change

(Continued from Page 13)

requirement is that it be usable by both professional programmers and the general public.

According to the IBM trial documents (in the Telex case), "The system must be usable by people who are not programmers, not professionals, not college graduates and not necessarily high school graduates." For the professional, extensions in languages, data handling and system facilities would need to be made.

To meet the requirements of nonprogrammers, on the other hand, an IBM study group recommended the following:

1. "A layman's language to facilitate system use."
2. "A general-purpose query update language (a subset of the layman's language)."
3. "A Common Command Language by which, with equal facility, operators may effectively manage both simple and complex installations."
4. "Language facilities that emphasize simplicity for the user, provide inherent tutorial capabilities (e.g., leading by hand, etc.)."
5. "Facilities to implement occupational or problem-oriented languages . . . based on industry terminology."

Programmer Features

The professional programmer would have new features with which to work, including:

1. "Extensions to current languages to facilitate the implementation of data independence, the identification of parallelism within programs, the variable binding of programs to system resources and [the provision of] data flexibility to meet [future user] requirements."
2. "Expansion of compilers to provide interactive execution for computer-assisted problem solving, program development and debugging."
3. "The introduction of all new functions via the primary higher-level languages of the marketplace."
4. "Minimization of the requirement to use lower level languages for new functions."

What does all this really mean? The basic thesis is ease of use and support for the concept comes from the necessary program strucures. The end result is that the program restrictions of the past will be reduced or eliminated.

Some additional system software goals are outlined below:

- User orientation

Nonprogrammers, executives, nonprofessionals
Bridge gap between man and machine
Unify all system software
Reduce maintenance and support required

- Availability

Isolate users from each other
Correct minor system anomalies

- Opacity

Divorced from hardware concerns

- Greater user security and privacy
- High-level languages only
- Migration and coexistence of new and old

Eliminate forced conversion

- Higher level of reliability, availability and seviceability (RAS) "like a utility"

Failure detection, isolation and bypass
Automatic restart and journaling
Automatic reconfiguration

- Multiprocessing support
- Computer networks support

Lecht is the author of four previous books on computer-related matters: The Programmer's Fortran II and IV, the Programmer's Algol, The Programmer's PL/I *and* The Management of Computer Programming Projects.

He is president of Advanced Computer Techniques Corp., which he founded in 1962, and has lectured widely for such groups as the Association for Computing Machinery, American Management Association, American Society for Information Science and Data Processing Management Association.

ON ANY TRACK WE'RE HARD TO BEAT

When you talk about leasing an IBM/370, you are on a fast track. Each leasing company claims it has the best program for you. But does it? With over $200 Million of IBM/370 equipment on lease in the U.S. and overseas, Alanthus' customers are saving more than $17 Million annually. That's a real winner!

Our leases are unmatched in flexibility. We can offer you a short operating lease, a long term financial lease, or even a revolving lease. Working with you, we can custom tailor the lease program to suit your needs. You win again!

But here's one to get you first past the post. Alanthus is offering to installed 370/158 and 370/168 users, operating leases of 1, 2, 3, and 4 year terms.

Our lease documentation is easily read and understood. It consists of only four pages plus an equipment schedule. Another winner!

Call the people from Alanthus. We have the lease program that's best for you. We're winners on any track.

The original name in magnetic media is the name to look for in information processing... BASF.

Back in 1932, BASF invented magnetic tape . . . the forerunner of all of today's magnetic information processing media. Since then, we've had plenty of time to put together the best-performing, most comprehensive line of information processing media on the market.

Whatever you need in magnetic media, BASF makes it and makes it better. We've developed a tape-slitting technique that gives the cleanest edge available . . . coating and polishing methods for disk packs that makes head crash a thing of the past . . . flexible disks with the lowest head-wear factor in the business . . . mag cards with superior information retrieval capabilities. Even our dictating cassettes are designed to give you something extra . . . magnetic leaders that provide instant recording capability, so you never lose any information.

Ask our customers . . . most people who choose BASF make it their only choice. Then ask your supplier about BASF prices. You'll find that BASF quality costs no more than the competition. For details on BASF information processing media, write BASF Systems, Crosby Drive, Bedford, Mass. 01730, or call our nearest regional office: in Los Angeles, (213) 451-8781; in Chicago, (312) 343-6618; in Clifton, N.J. Editorial

A Mini Plea for Help

Are minis really taking over the DP world? The survey below is designed to help us find out.

We'd like to know how widespread the use of minis really is and how people are buying and using them.

Take a few minutes to help us answer these questions. The results of the survey will be published in a future issue of *Computerworld*.

Just fill out the form and return it to us in the prepaid envelope provided in this issue. Mark "Editorial" on the outside.

1) What class of small system do you have?
(a) small business system (b) minicomputer (c) supermini (d) distributed processing system (e)other ______________________

____

2) How many small systems do you have?

____

3) Please identify the systems by manufacturer(s) and model(s ______________________

____

4) Do you have a large mainframe? Which one?

____

5) Do you use your mini(s) for single or multiple applications? ______________________

____

6) Would you rather (a) do your own programming (b) get outside programming help or (c) purchase a turnkey system? ______________________

____

7) What was the major criterion that made you decide on this particular system (or systems)?
(a) Word of mouth (b) ease of programming (c)throughput (d) price/performance(e) software capability (f) vendor reputation (g) other ________

Letters to the Editor

Some Exciting Micro Developments Deprived of Adequate Coverage

I just finished reading the June 20 issue of *Computerworld* that included a number of reports on the National Computer Conference. I am very surprised that it appears that you have ignored some of the very exciting microprocessor developments.

I am thinking especially of the PET microcomputer system introduced by Commadore, which delivers a complete 1K Basic system for $800.

The computer industry seems abuzz with this development and many of us in the computer industry are very excited and hopeful that this is an exciting portent of things to come. To find no mention of it in your June 20 issue seems a little unusual.

I guess this wouldn't seem quite so strange if other people had not called to my attention in the past that CW seems to somewhat ignore the micro field. This came up last when the Microcomputer Fair was held in San Francisco and there was no apparent mention of it in your publication.

I should let you know that one reader is wondering why you are ignoring such an exciting new field. I hope you will give more news to the microcomputer developments; otherwise some of us may not renew our CW subscription and will renew our subscriptions to *Byte, Personal Computing*, etc.

Gary Carlson

Provo, Utah

On Protecting the CDP

I have held my Certificate in Data Processing (CDP) since 1965, but have not been particularly active in any of the many organizations for DPers and industrial engineers. It grieves me, however, to see the members of a profession, who should be proud of its achievements and its future, scuffle over trifles.

This is not the mark of professionalism.

Kenniston W. Lord Jr.'s item in the issue of June 20 ["Your CDP Designation May Become Outdated Unless You Speak Up"] caused me to offer my thoughts on the subject of multiple examinations in every conceivable facet of DP.

The thoughts were originally expressed in a letter to the Society of Certified Data Processors in response to a questionnaire on attitudes towrds this and other related subjects. It is not often that I agree with Ken's ideas, but in this instance I am with him 100%.

If you want a device for tradesmen to boast, "I am a certified ______" (fill in the blank with programmer, coder, data base specialist, keypuncher, computer operator, systems analyst, computer auditor, etc. ad nauseam), then by all means provide a batery of tests.

But, if you want recognition for true data processing professionals, follow the lead of the accountants and provide a single examination reinforced by educational and experience requirements which will identify the professional and distinguish him from the journeymen.

Do not cheapen what so many have worked so hard to obtain.

John J. Mason

Hillcrest Heights, Md.

In Defense of Best Interests

Contrary to a reference in the article entitled "DOD May Soften Stance for Standard on Channel-Level I/O" [CW, May 30], IBM has never said its I/O channel interface was technologically obsolete.

We are opposed to its adoption as a Federal Information Processing Standard because we believe creating this type of standard can deny the federal user of future technological advances, which is clearly not in the best interest of the user, the government or the computer industry.

J.S. DeBlasi
Director of Standards

IBM

Data Past

Five Years Ago
July 5, 1972

HARRISBURG, Pa. — The big cleanup began after tropical storm Agnes crippled DP centers in five states. DP managers in hard-hit areas made plans to install new systems and tried to retrieve lost files by any means available, including drying out millions of waterlogged punch cards and cleaning out mud-coated disk packs and tapes.

— — —

SACRAMENTO, Calif. — A bill which exempted from taxation all software except that sold with a computer was signed into law by Gov. Ronald Reagan. The exemption was for two years and was intended to give the state time to arrive at a sound basis for assessing all software.

Eight Years Ago
July 9, 1969

Increases of up to 25% in DP costs were expected by major users of IBM equipment as the primary result of IBM's unbundling, effective Jan. 1, 1970.

— — —

NEW YORK — Intercomm, a system monitor called the "missing link" of communications was developed by Programming Methods, Inc. for the IBM 360. The system was intended to provide a comprehensive package that blended the accessing of data, the operating system and the data base into a single environment.

Business Employers Discriminating?

Should a Degree Be a DP Employment Requirement?

By Jack Stone
Special to Computerworld

Legislation passed during recent years protects Americans against discrimination in employment on the basis of race, creed, color, national origin, sex, age and physical appearance, among other qualities.

These laws have given rise to agonizing reappraisals of current policies, methods and tools for DP personnel recruitment, placement, promotion and discharge.

For example, aptitude testing for entry-level DPers is currently under fire because of concerns that such tests are inherently biased towards certain social classes and therefore, are not sufficiently accurate in predicting successful performance in the DP environment.

Another issue, the subject of this week's column, is the question of whether the specification of a college degree is a proper prerequisite for employment of a programmer or analyst who is exclusively engaged in the support of business systems.

The implication is, of course, that the college degree establishes a basic level of competence in the field, irrespective of the knowledge a myriad of DP career successes achieved without degrees.

As illustrated in this passage excerpted from a recent recruitment advertisement, the connection between the job need and a B.A. degree often appears tenuous:

"Junior analyst/programmer with experience in the development of interactive systems using Cobol and TSO on IBM System 370. Knowledge of commercial data base management systems in support of health or medical research programs preferred. Bachelor's degree and minimum two years experience required."

The issue is well presented in this eloquent letter from a regular reader of this column:

Dear Jack:

I have read the recent items in *Computerworld* concerning discrimination against women and the relative merits of recent computer science graduates as opposed to experienced programmers.

I also read the letter in the March 7 issue of CW from Lynn Pond of Chicago, who is not having much success in finding a new job because she does not have a college degree, even though she has 20 years experience.

I have tied these two observations together to arrive at the thought that perhaps there is a bias against otherwise qualified persons in DP who do not have college degrees.

My situation is as follows: I have several years of experience as a business applications programmer and am presently using Cobol on an IBM 370/135 running under DOS/VS.

My programming knowledge came from several different sources. I attended the Control Data Institute shortly after I graduated from high school, and I received on-the-job training where I worked. In addition, I took evening courses in the computer science department of the local community college, where I have accumulated 35 credit hours.

One reason I have been taking college courses is that I am afraid one day I will be unable to find employment for which my programming experience has prepared me because I will not have a college degree. Several concerns have led me to this belief:

One is the talk of the "Certified Data Processor" requirement. As I understand it, if the state legislatures were to pass this requirement, one would need to hold a Certificate in Data Processing (CDP) in order to perform certain functions. In order to qualify for the CDP, one would need a four-year college degree.

Also, despite the fact that I am not looking for a new job, I periodically check recruitment ads just to stay abreast of things. There are frequent ads for business applications programmers using Cobol which state that a degree is required. Because the ads describe work that appears to be the same type as mine, I have difficulty rationalizing the need for a degree.

The Human Connection

I have come up with some possible explanations of why organizations require degreed people for business appliations development, but I don't see their validity:

- Perhaps these organizations fear (or hope) the CDP requirement will go into effect and are preparing for that day by hiring only persons who will have the academic credentials to sit for the exam.
- Maybe the organization wants to be sure it is hiring people who have mastered basic writing and math skills commonly taught in college. But since these skills are taught at the freshman level, why not at least consider persons who have some college experience but no diploma?

And, as a matter of fact, why not consider those individuals who have learned these skills in high school or on their own?

- Perhaps these employers shy away from people who have some college credits but haven't graduated because they want someone who has shown perseverence during a four-year period. Wouldn't continued employment with the same firm or in the same field be just as acceptable?
- Maybe these employers are afraid to hire someone who has left college without a degree, feeling that this person "flunked out." Yet, many people who have left college for academic reasons have proved successful in their DP working careers. College classes which lead to nonsuccess often have no relationship to DP training.

And many people have left college without "flunking out" — it is widely accepted that college is just not right for everyone. Also, just because a person doesn't go to college does not mean that the person wouldn't do well if he attended college.

Although a college education may not always be required for an advertised position, most companies require a degree for advancement.

Therefore, I would suspect that in such circumstances only degreed people are considered in order to avoid hiring people with a limited opportunity for advancement.

Perhaps the question of the need for degreed people in DP management positions is one to be explored on another occasion).

As a closing note, my current employer has no employment requirements regarding college education, and I think we do very well.

Regina S. Litman
Rockville, Md.

Readers wishing to express their views on the subject of college requirements for business DP may write to Stone, Suite 222, 2233 Wisconsin Ave. N.W., Washington, D.C. 20007.

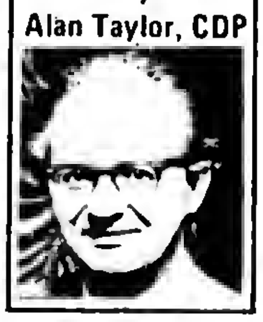
Ombudsman Concept

Individual Attention Can Improve Accuracy of Letters

Last month's *Communications of the ACM* had one of the more disturbing announcements in it regarding the Association for Computing Machinery's (ACM) use of personalized letters — in this case from its Ombudsman Program. It read:

"**ACM Ombudsman Program.** The chairman of the ACM Ombudsman Committee, Dahl Gerberick, is asking all ACM members to take note of articles that appear to blame the computer for some problem. Please clip and send such items to James Adams at ACM headquarters. A personalized letter from the ombudsman will then be sent to the publisher of the article or story, pointing out that the computer is only a tool and should not be blamed for its use."

The Taylor Report
By
Alan Taylor, CDP



The whole basis of the "ombudsman concept" is that individual consideration is given to each specific occurrence. Now, it appears the program is going to give individual consideration to each letter by personalizing it to the publisher. But that type of personalization does not give individual consideration to the computer-related problem behind the complaint.

Knee-Jerk Reaction

When the program apparently intends to do is give an automatic reaction to the articles' failure to explain the well-known difference between a program and a computer. In actual fact, "computer" is now common shorthand for computer-programmed logic or output.

For instance, the General Motors ad on the back cover of the *Communications* talks about computers that "see" and about a computer system that "learns" and "inspects."

Apparently no one at the ACM objects to this phraseology or to the computer being given the credit perhaps due some software people. Why should we then continue to object to normal shorthand use of "computer"?

Positive Side

Yet, personalized letters may not be such a bad idea after all — if the ombudsman understands he is not just a public relations man, automatically defending computers, but is a thinking, responsible person.

Personalized letters, no matter how bad in the first place, can act as a two-way communication method for improving the sender's understanding of the situation.

The Ombudsman Program, through creative use of such letters, could improve the ACM's understanding of what the world at large is actually thinking.

This use of personalized letters as a two-way operation is perhaps best known through the *Newsweek* life-time guarantee program, which has been running for about 30 months now. Its latest version arrived in the same batch of mail as the ombudsman's appeal.

One of the selling tools of the *Newsweek* campaign from its outset was the idea that everyone had been "selected." In early efforts, this was brought out in a paragraph that used the street address, but this sometimes led to results such as:

"You can be certain, **Mr. Clinic** . . . That this letter is not popping up in everyone's mail **on & Colby**."

This comes from the address: S.A. Clinic, 39th & Colby, Everett, Wa. The street address has since been omitted in the letter in favor of a more general: "The letter you have just finished was sent to a carefully selected audience."

Another Focus

Another focus of the appeal was parental responsibility, using "household" or "family" with the presumed last name. The results went wrong in some cases such as this:

"You didn't know? With **Newsweek**, the **Dir DP household** would. Just read a little further for a few choice words from **Newsweek** about . . ."

The word "household" has since been changed to "children," which solves some problems, but not all; a clinic, for example, could have children.

After receiving *Newsweek*'s latest mailing, I had a few words with the fellow behind the program, Daniel Capell, a *Newsweek* vice-president.

Improvements in the mailings came about through reading recipients' complaints and then, after agreeing they were or were not justified, initiating steps to come up with another way of saying the same thing more accurately the next time around.

This apparently doesn't give Capell any great trouble. He just spends a few moments analyzing the complaint and deciding what to do about it. Most complaints reach his personal desk, so real consideration at a policy level is reached quickly.

Working Solution

This correction system works.

When the *Newsweek* campaign started, and for over a year afterwards, many of you sent copies of its letters, but I haven't had more than a couple in the past six months, although there still are name problems. One unexpected problem is in not carrying the title "Mrs." through with a repeated married name. This failure creates unnecessary confusion with the husband in many cases, and sometimes with the children, if only initials are used.

Hopefully, if the ACM letter is phrased so as to invite communication from the people who wrote the articles about computer faults — and if the ombudsman takes the time to review both the articles and the responses properly — we can hope for a really useful understanding of the advancing knowledge of computers.

Both the bad and the good parts will become understood both inside and outside the ACM.

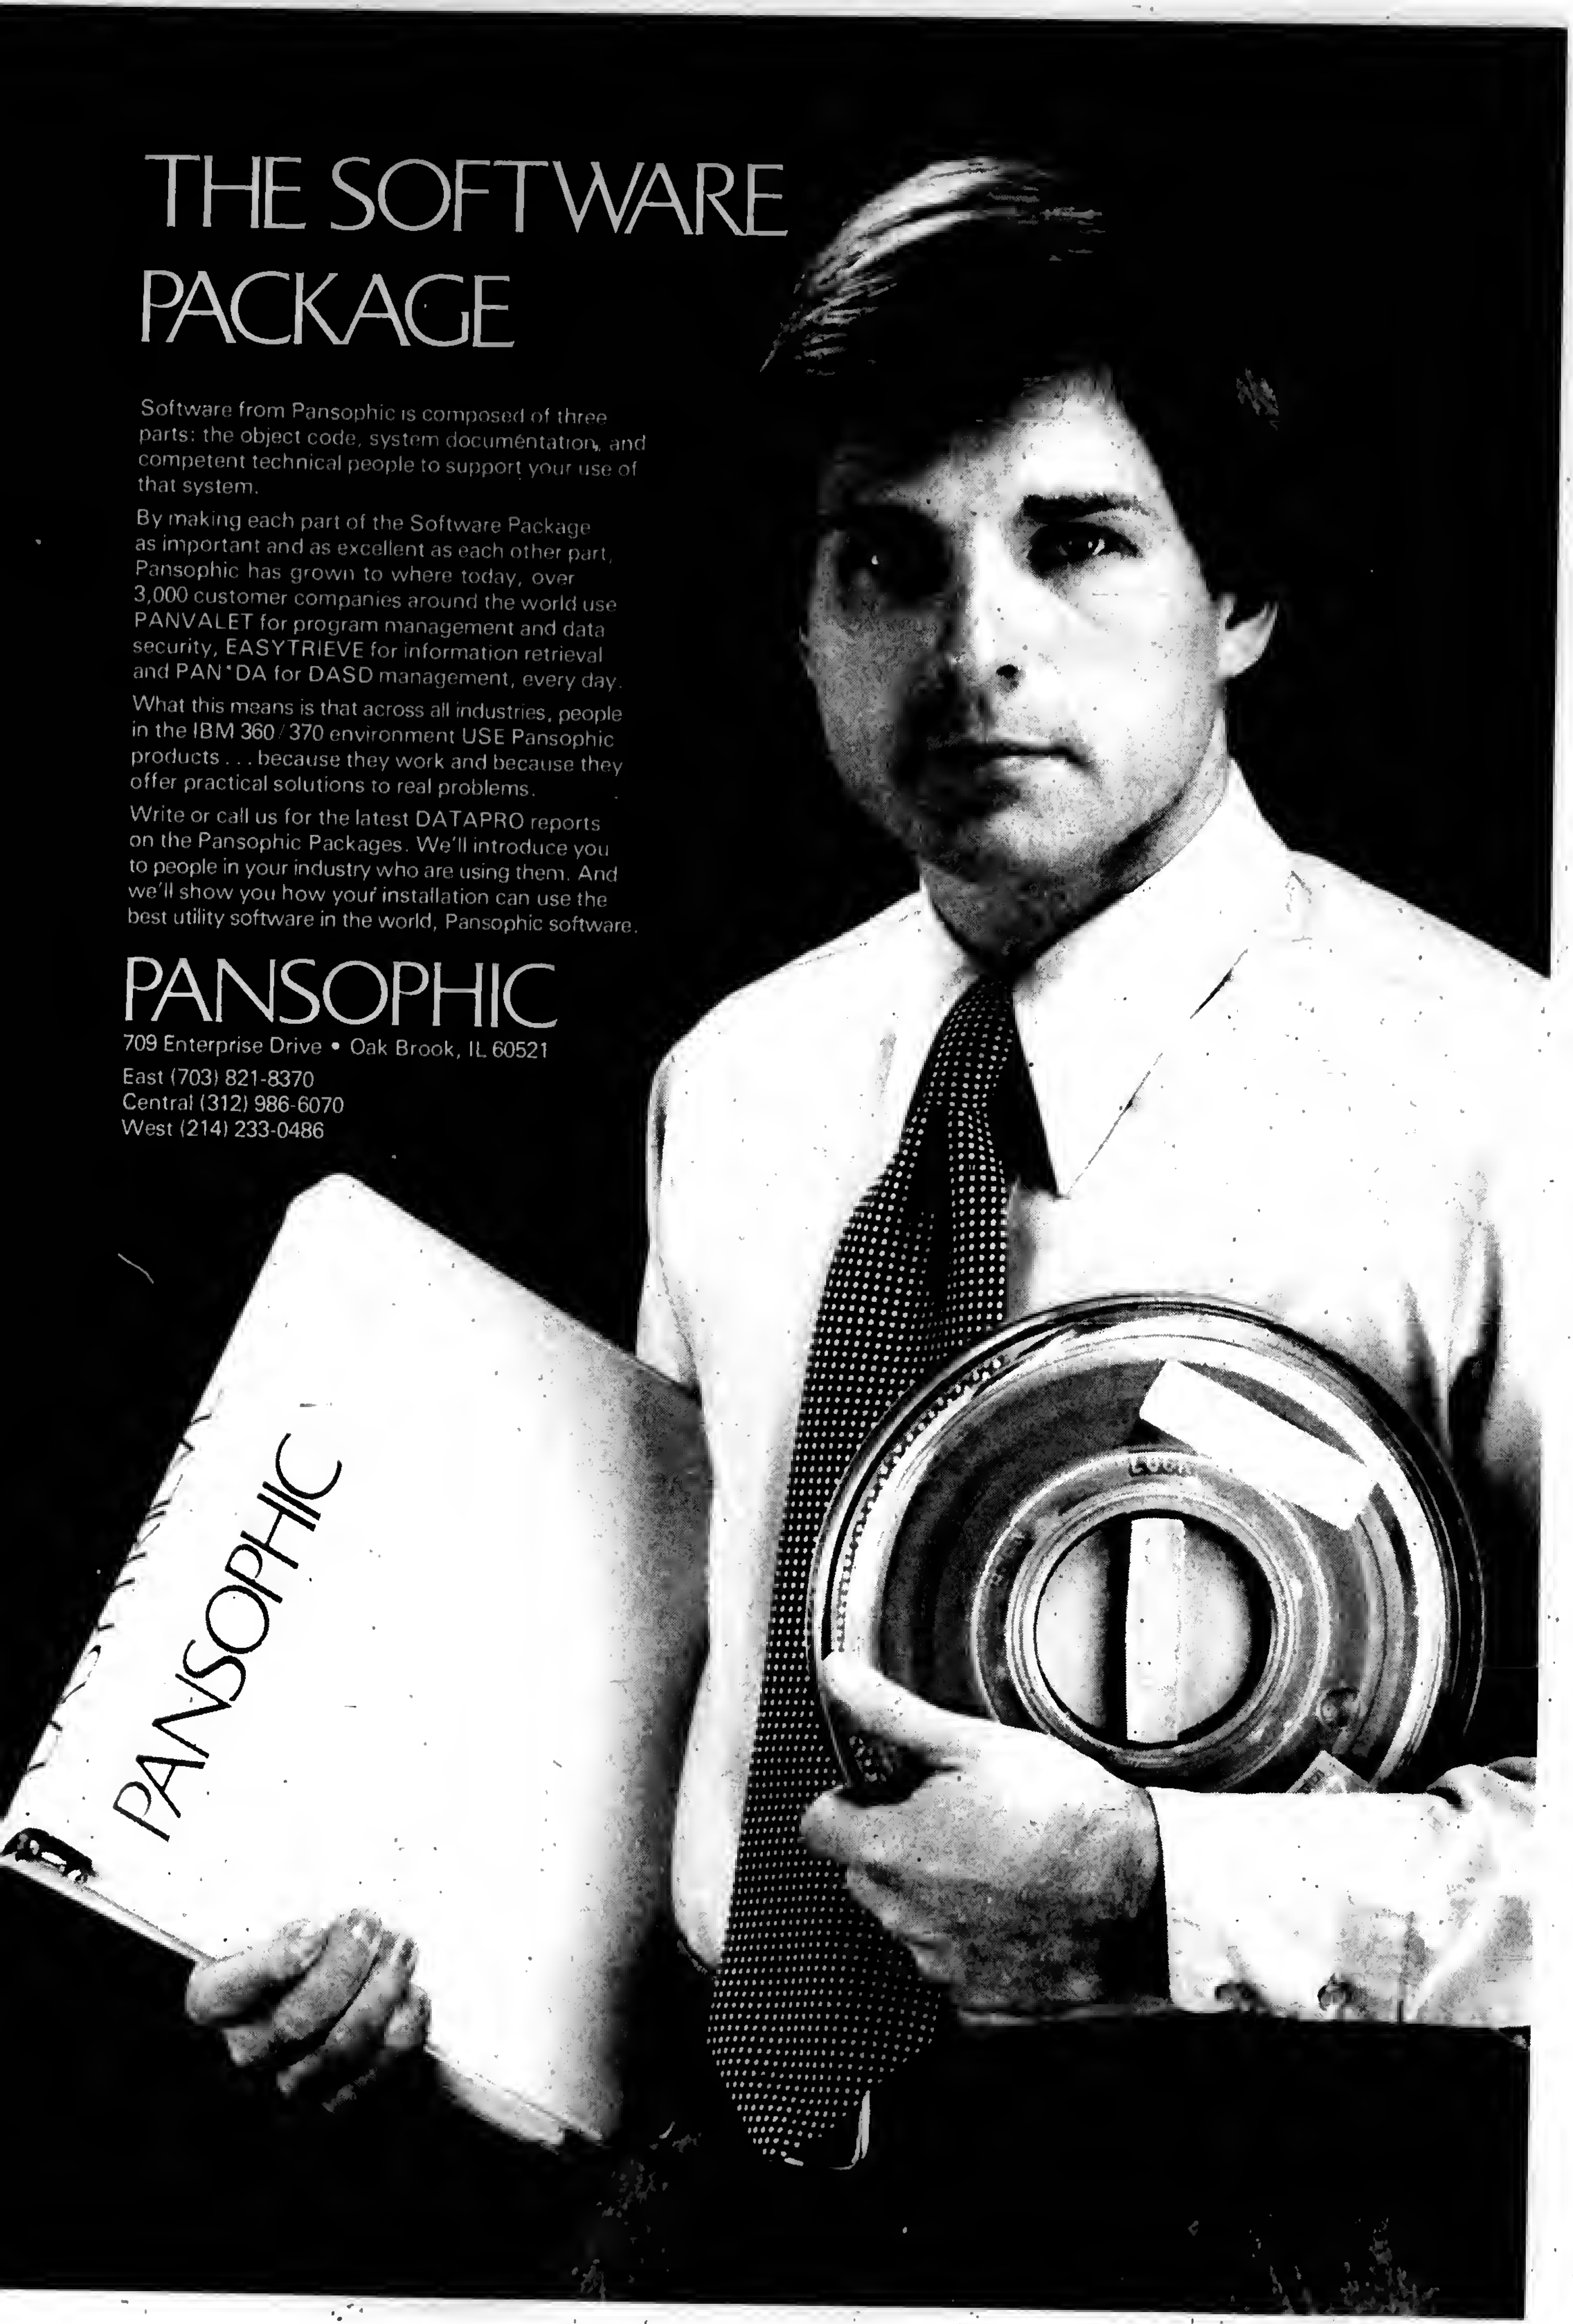
'You've Got a Cracked Shoulder on Your Chip.'



THE SOFTWARE PACKAGE

Software from Pansophic is composed of three parts: the object code, system documentation, and competent technical people to support your use of that system.

By making each part of the Software Package as important and as excellent as each other part, Pansophic has grown to where today, over 3,000 customer companies around the world use PANVALET for program management and data security, EASYTRIEVE for information retrieval and PAN*DA for DASD management, every day.

What this means is that across all industries, people in the IBM 360/370 environment USE Pansophic products . . . because they work and because they offer practical solutions to real problems.

Write or call us for the latest DATAPRO reports on the Pansophic Packages. We'll introduce you to people in your industry who are using them. And we'll show you how your installation can use the best utility software in the world, Pansophic software.

Five Basic Steps Described

Multilevel Approach Eases Data Base Design Chores

By Don Leavitt
Of the CW Staff

DALLAS — The design of large data bases involves a wide range of problems — from the application system specification to the choice of hardware. That is a difficult assignment, but a multilevel approach to the design of file organization seems to help, according to Arne Solvberg, professor at the University of Trondheim, now on leave and working at IBM in San Jose.

Such an approach has several advantages, Solvberg told attendees of a session on data base structure and organization at the National Computer Conference here recently.

It allows transparency of the design procedure, elimination of non-effective solutions at an early stage and postponement of the hardware/software selection until an appropriate design level has been reached, he claimed.

The multilevel approach consists of five basic steps. It starts with the specification of the information processing problem to be solved, then shifts into an effort to transform the specified information structures into a logical model of the file organization, Solvberg explained.

That is followed by modifying the logical model to fit a particular data base management system (DBMS) and physically implementing the modified model using the DBMS. The process winds up with an evaluation of the final solution using a performance analysis, he said.

The specifications for the problem are gathered in fairly routine ways, but then information is extracted from the analysis to "normalize" the procedure.

The user has to gain a description of the concrete or abstract objects that make up the system and the relationships between the objects. Then he must describe the permanent files (in terms of their purpose) and the retrieval processes to be implemented.

The linkages between file types — "messages" in Solvberg's terminology — are normalized and then the normalized message types are synthesized into a logical model. Finally, the model is modified in order to fit the retrieval requirements, he said.

So far no decision about any DBMS has been made, Solvberg noted. But the logical model is now modified to fit a particular DBMS in the "best possible" ways — by modifying the record layouts and altering the access paths.

Restructuring Approach

Earlier in the session, James P. Fry of the University of Michigan outlined an approach he had developed to cope with the need to restructure a data base once it no longer fit the installation's needs.

Fry said two approaches had been considered and that an "access path" approach to the creation of a restructuring language for network-oriented data bases was selected as the most likely to be effective.

The access path approach, in which all source structures are treated in the same way, is "more naturally suited to complex network transformations," he claimed.

Restructuring is an operation that accesses rather than manipulates data, therefore the operation is unaffected by the logical structure of the data bases, Fry explained.

Thus almost any data base is a valid candidate for restructuring, Fry noted, and there need be no similarity between the source and target data base.

Ledger System Designed for Flexibility

NEWTON UPPER FALLS, Mass. — G/L Plus, the general ledger/financial analysis package from McCormack & Dodge Corp., is described as a highly flexible and comprehensive DP system.

At the same time, adherence to traditional accounting procedures and controls makes it "very user-oriented," a spokesman said.

The system handles multiple corporation processing of financial accounting and statistical data. Journal entries are entered manually or extracted from the output records of supporting subsystems such as payroll, accounts payable or accounts receivable.

The linkage between the user's existing subsystems and G/L Plus is transparent, the spokesman noted.

Coding provided by McCormack & Dodge "translates" the format of the output records into the format needed by the ledger system, performs front-end prorations and allocations, provides offset transactions und consolidates like transactions, he said.

Limitless Reports

Reports generalized in a single pass of the system are vitually limitless since they are parameter driven, the spokesman claimed. The user can specify the formats, the account groups and the reporting structure within the organization to be served by the reports.

Formats of virtually all normal accounting reports have already been coded, so the user has access to them as well as the freedom to shape others as special needs arise, he said.

Repeating journal entries are "warehoused" and each detail transaction contains its own start and stop date. Journal entries may be "diarized" to provide input worksheets for frequently recurring transactions, he added.

Accrual and reversal capabilities are standard. Retroactive journal entries updating prior periods of the same or the previous year are carried forward through all subsequent balances to accommodate post closing entries and restatement of selected reports, he said.

Erroneous journal entries are sent to an error recycle file or optionally balanced through a suspense transaction generation. Turnaround documents are generated to ease correction of errors detected, he explained.

The G/L Plus package consists of 18 ANS Cobol modules which can be implemented on any "moderate" sized IBM 360/30 or larger CPU.

The package now carries an introductory cost of $15,000 for installations willing to be Beta-test sites.

By the end of the year, the standard cost is expected to be in the $40,000 range, the vendor said from 381 Elliot St., Newton Upper Falls, Mass. 02164.

Series/1 Cobol Ready Shortly

ARLINGTON, Va. — Series/1 Cobol is a compiler providing a subset of ANS 1974 specifications for the IBM Series/1 minicomputer. It creates reentrant code to be executed under a run-time monitor, according to the vendor, Advanced Software Products, Inc.

The level of Cobol provided by this system is equivalent to the federal standard for Low-Intermediate Cobol and is similar to other minicomputer Cobols, a spokesman added.

The Series/1 Cobol is said to take full advantage of the Series/1 instruction set and give performance equal to optimized assembler language code on a Digital Equipment Corp. PDP-11/34 or Cobol code on an IBM 370/135.

Up to 65,000 Procedure Division statements and 8M bytes of Working Storage are supported by using virtual storage management, the spokesman said.

Version 1.0 of the compiler running under IBM's Control Program Support is expected to be ready for delivery next month, he noted.

It will require a minimum 32K bytes of main memory for compilations and costs $1,800 for the first site and $120 each for additional sites.

Advanced Software Products can be reached through P.O. Box 992, Arlington, Va. 22216.

Utility Set Supports IBM OS Operations

LYONS, Ill. — Users running under an IBM OS environment can consider a series of utility routines from General Electronics which the vendor claims will allow them to perform functions that are difficult or not now available using IBM's standard utility program.

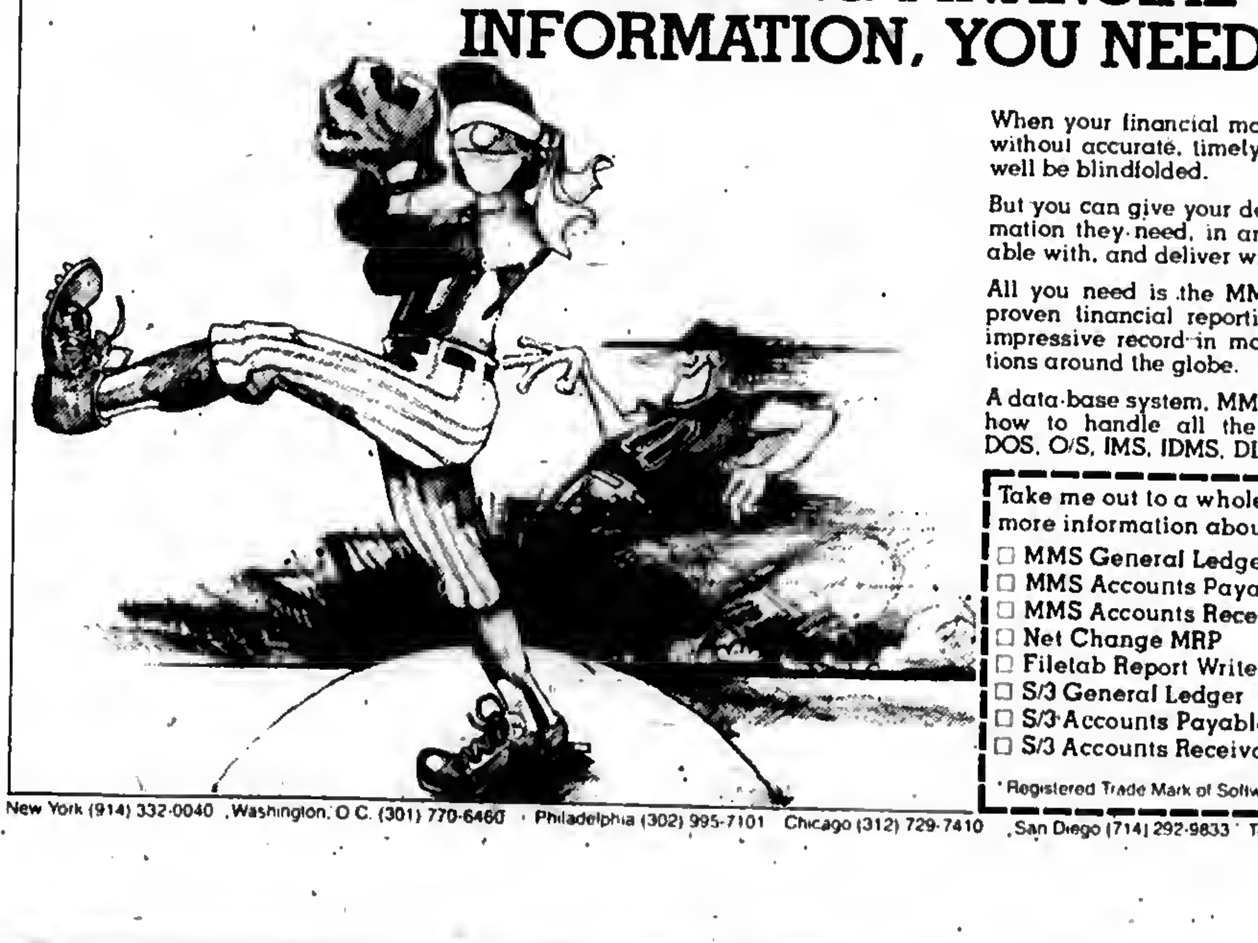
The Kopy routine, for example, copies lists and provides a list of records copied. Records may be expanded or truncated and reblocked under user control. This $100 utility is described by General Electronics as "10 times as efficient" as IEBGENER.

Doclist is said to prepare printer output from 80-byte text records. This utility supports overprinting for underlining or highlighting and, at $200, is said to be "great" for preparing prototype reports.

"Reformat" reformats data files, permitting rearrangement, deletion, truncation, expansion or reblocking of records. Optional listing of input and ouput records is provided with this $250 package, a spokesman noted.

General Electronics can be reached through P.O. Box 79, Lyons, Ill. 60534.

IF YOU'RE MAKING FINANCIAL DECISIONS WITHOUT TIMELY INFORMATION, YOU NEED THE MMS GENERAL LEDGER.



When your financial management makes decisions without accurate, timely information, they might as well be blindfolded.

But you can give your decision-makers *all* the information they need, in any format they feel comfortable with, and deliver with fast-ball speed.

All you need is the MMS GENERAL LEDGER. The proven financial reporting system, it's scoring an impressive record in more than 800 major corporations around the globe.

A data-base system, MMS GENERAL LEDGER knows how to handle all the league-leaders, including DOS, O/S, IMS, IDMS, DL/1 and TOTAL.

If your requirements need a heavy-hitter, the MMS GENERAL LEDGER is available with an additional *ON-LINE MODULE* that makes financial reporting a whole new ball game.

Best of all, MMS GENERAL LEDGER is only one member of Software International's all-star team, which features Accounts Receivable, Accounts Payable, Net Change MRP, Filetab Report Writer and three for Systems/3 — General Ledger, Accounts Payable and Accounts Receivable.

When the pressure is on and you can't afford mistakes, call or write Software International. Get the champion performer, MMS GENERAL LEDGER.

Take me out to a whole new ball game of financial reporting. Please send me more information about:

'Gremex' Helps Teach Management Decision Making

ATHENS, Ga. — The Goddard Research and Engineering Management Exercise (Gremex) system from the Cosmic clearinghouse is a man-machine management simulation game that can be used to depict a project from just after the development of its plan through the final construction phase, according to a spokesman.

Gremex is basically a program evaluation and review technique (Pert) reporting scheme, he said. Unlike usual Pert routines, however, this program does not require the operator to input the amount of work performed in each activity before it can determine the expected completion date of the project.

The package assumes that all activities due to be worked in the current month will be worked. Gremex predicts new durations and costs based on management actions taken by the players and on the contractor's abilities, the spokesman added.

Each activity is assigned cost and duration estimates, but must also be assigned parameters indicating the probability that the estimates will be met and that the project will be a technical success.

Management actions usually can be expected to change these probabilities; reestimating future events and assigning probability factors provides life to the Gremex model, the spokesman noted.

Gremex is not a production job for project management; it poses no "best way" to manage a project but does expose participants to many of the factors involved in decision making when managing a project, especially in a government research and development environment.

A management team can win the game by surpassing cost, schedule and technical performance goals established when the simulation began. The serious management experimenter can use Gremex to explore the results of management methods he could not risk in real life, the spokesman claimed.

Written in Fortran IV for execution in batch mode, it has been implemented on an IBM 360 with approximately 350K bytes of memory available to the user.

Cataloged as program number GSC-11512/CW, the system costs $810. Documentation is available for a separate fee of $8, the Cosmic spokesman noted from 112 Barrow Hall, University of Georgia, Athens, Ga. 30602.

Join the more than 1000 DP Managers now using the Johnson Job Accounting Report System.

1960 payroll?

It's not easy trying to run half-astute, retread 1960 payroll, personnel packages on a 370 . . .

Wang users don't have the problem. Wang payroll/personnel/ ERISA software is specifically designed for whatever 360/370, Burroughs, Honeywell, Univac environment you have . . .

For more, just call Joe Nestor (617) 851-4111, Wang Laboratories, Inc., Lowell, MA. 01851. In California, call Carl Tarascio (714) 631-0138.

WANG

Manufacturers Gain Network Aid

ST. LOUIS — The Advanced Manufacturing, Accounting and Production Systems (Amaps) software from Comserv Corp. will be available to users in the U.S. and Europe through the facilities of the McDonnell Douglas Automation Corp. (McAuto), under terms of an agreement recently signed by the two companies.

The system is said to provide integrated control over the diverse operating departments and functions of a manufacturing company. Its use "solves many of the communications, production and material control problems inherent in a company of this nature," a Comserv spokesman stated.

Amaps consists of nine modules: bill of material, material control, material requirements planning, forecasting, purchasing control, standard cost, capacity requirements planning, process and routing, and shop floor control.

Users on the network will be free to utilize just those parts of the system that are pertinent to their needs, just as users with in-house IBM 360/370s have been able to install those elements they wish, Comserv said.

Comserv is at Metro Office Park, 3050 Metro Drive, Minneapolis, Minn. 55420.

McAuto has branch offices in a number of cities; network headquarters can be reached through P.O. Box 516, St. Louis, Mo. 63119.

Versatec Software Plots Gray Tones

SANTA CLARA, Calif. — Full gray-scale halftones can be produced on any Versatec electrostatic plotter equipped with a specially developed Fortran package, according to a spokesman.

Unlike previous digital gray-scale techniques, the Versaplot Gray Scale software maintains both high contrast and sharp detail, the spokesman said.

Blacks are "100% black," whites are "100% white" and only gray areas are screened, he stated.

The Versaplot Gray Scale software provides "more than 32" levels of gray. "This is more refined scaling than the eye can differentiate," he claimed.

Gray scale is emulated through controlled variation in dot clusters (halftone cells) produced on the electrostatic plotter. With 200 dot/in. Versatec plotters, 40,000 dots are available for each square inch of image area, he said.

Going beyond emulation, the software can be used to modify digital images. Dot clusters, each simulating a halftone dot, can be reshaped in outline, spatial frequency and contour. The user may also select the number of gray levels to be permitted, the spokesman said.

The Versaplot Gray scale package consists of less than 1,000 Fortran statements and can be run on any minicomputer with 16K bytes of memory and a disk file, he added. It may be used by itself or in conjunction with Versatec's generalized Versaplot electrostatic plotting software.

The Gray Scale package is available for a one-time license fee of $1,000, the spokesman noted from 2805 Bowers Ave., Santa Clara, Calif. 95051.

Data Base Dictionary Published by Atsu

BOULDER, Colo. — A directory of interactive data bases, "Data Bases Available to Users," has been compiled and published by the Association of Time-Sharing Users (Atsu).

With descriptions of 250 data bases from 25 remote-computing vendors, the 75-page report is indexed by subject. Among the topics covered are banking, business, economics, education, energy, engineering, finance, science and stocks and bonds, a spokesman said.

Atsu, a 1,200-member nonprofit association, also publishes a bimonthly newsletter called "Interactive Computing" and a two-volume set of directories that cover many aspects of remote computing.

The organization also includes a number of special interest groups and regional user groups which meet at various times during the year.

"Data Bases Available to Users" is part of the two-volume set of directories distributed free to Atsu members, but it is also available separately to nonmembers for $15.

New members are always welcome, the spokesman added from Atsu headquarters at 75 Manhattan Drive, Boulder, Colo. 80303.

Canadian Firm Has APL Planning Course

TORONTO — Assistance in the planning and operation of APL on in-house equipment, regardless of the vendor, is now being offered by Numetrix Ltd. Neither time-sharing vendors nor computer manufacturers can provide the degree of impartiality this independent can, a spokesman claimed.

One of the lines of support Numetrix provides is a modularized APL education and training course consisting of texts, lab and teaching aids. The course is adaptable to meet the needs of the user, whether he is working with an IBM 5100, a Digital Equipment Corp. Decsystem-20 or a Hewlett-Packard 3000, the spokesman added.

Companies using APL for business applications usually start by subscribing to a time-sharing service, he said, but eventually a range of factors — costs, concern about sensitive data, inconsistencies between in-house and outside processing techniques — make consideration of in-house APL necessary.

Numetrix can help evaluate the alternatives and implement decisions on a case-by-case basis, the spokesman stated from Suite 602, 3 Church St., Toronto, Ont., Canada M5E 1C9.

WE CAN HELP YOUR COMPUTER TO DO MORE OF THE WORK.

UCC software is solving problems in more than 1,500 installations. Worldwide. We can help your computer do more of the work, too. With software systems like:

TAPE MANAGEMENT: UCC ONE's 500 installations represent about ¾ of all installed OS tape management systems. UCC ONE manages your tapes and protects valuable data from loss or destruction. It provides real-time tape status. Eliminates costly, handwritten records and the expensive mistakes they breed. Gives you better control and greater efficiency.

DOS UNDER OS: UCC TWO lets you continue to use your DOS programs – without reprogramming – while you convert to OS. You plan the conversion or consolidation to fit your work schedule, instead of the other way around. You can consolidate your DOS operation into your OS/VS environment today. Or, you can spread the conversion – and the costs – over months. UCC TWO is the best path to OS and 500 users have proven it.

DISK MANAGEMENT: UCC THREE/ADAM solves the problem of inefficient DASD space usage. Based on user specifications, it automatically scratches unneeded, unused and invalid data sets. Or it will migrate the data sets to tape, based upon any combination of criteria – such as usage frequency, size and retention period. Then, UCC THREE keeps the problem from recurring by controlling data set allocation. Fragmentation and the need to periodically compress packs is reduced. Accurate reports on your current space utilization are produced.

PDS SPACE MANAGEMENT: UCC SIX is the only software package that eliminates PDS compression – because it automatically inventories and controls PDS disk space. It spells the end for ABENDS and "dump and restore" operations caused by exhausted PDS disk space. You even save money on your disk investment, too.

IMS DATA DICTIONARY/ MANAGER: UCC TEN is the standard IMS dictionary, with over twice as many installations as the Program Product offered by its nearest competitor. Not only does UCC TEN give you superior control over your data base environment, it also defines your data communication network, produces 3270 screen formats and generates IMS Stage I SYSGENS. Now, at last, you can get the benefits you expected from IMS.

RESTART/RECOVERY MANAGEMENT: UCC FIFTEEN lets you restart at the proper job step – instead of at the beginning. The OS catalog is corrected, unnecessary direct access data sets are deleted, and GDG biases are properly altered for the rerun. Automatically – so manual errors in restatting and rerunning are eliminated.

FINANCIAL SOFTWARE: The UCC General Ledger/Financial Control System is the most advanced and complete system of its type. Full general ledger accounting. Budgeting. Cost allocation and profit center reporting. It can generate over 100 standard reports. Plus, it has an easy-to-use report writer that the Accounting Department can use – with a minimum of EDP assistance.

SUPPORT: It takes more than code to make a good software product. It takes dependable, long-term maintenance and support of these products. And support is just one more way that we're helping the computer to do more of the work in more than 1,500 separate installations.

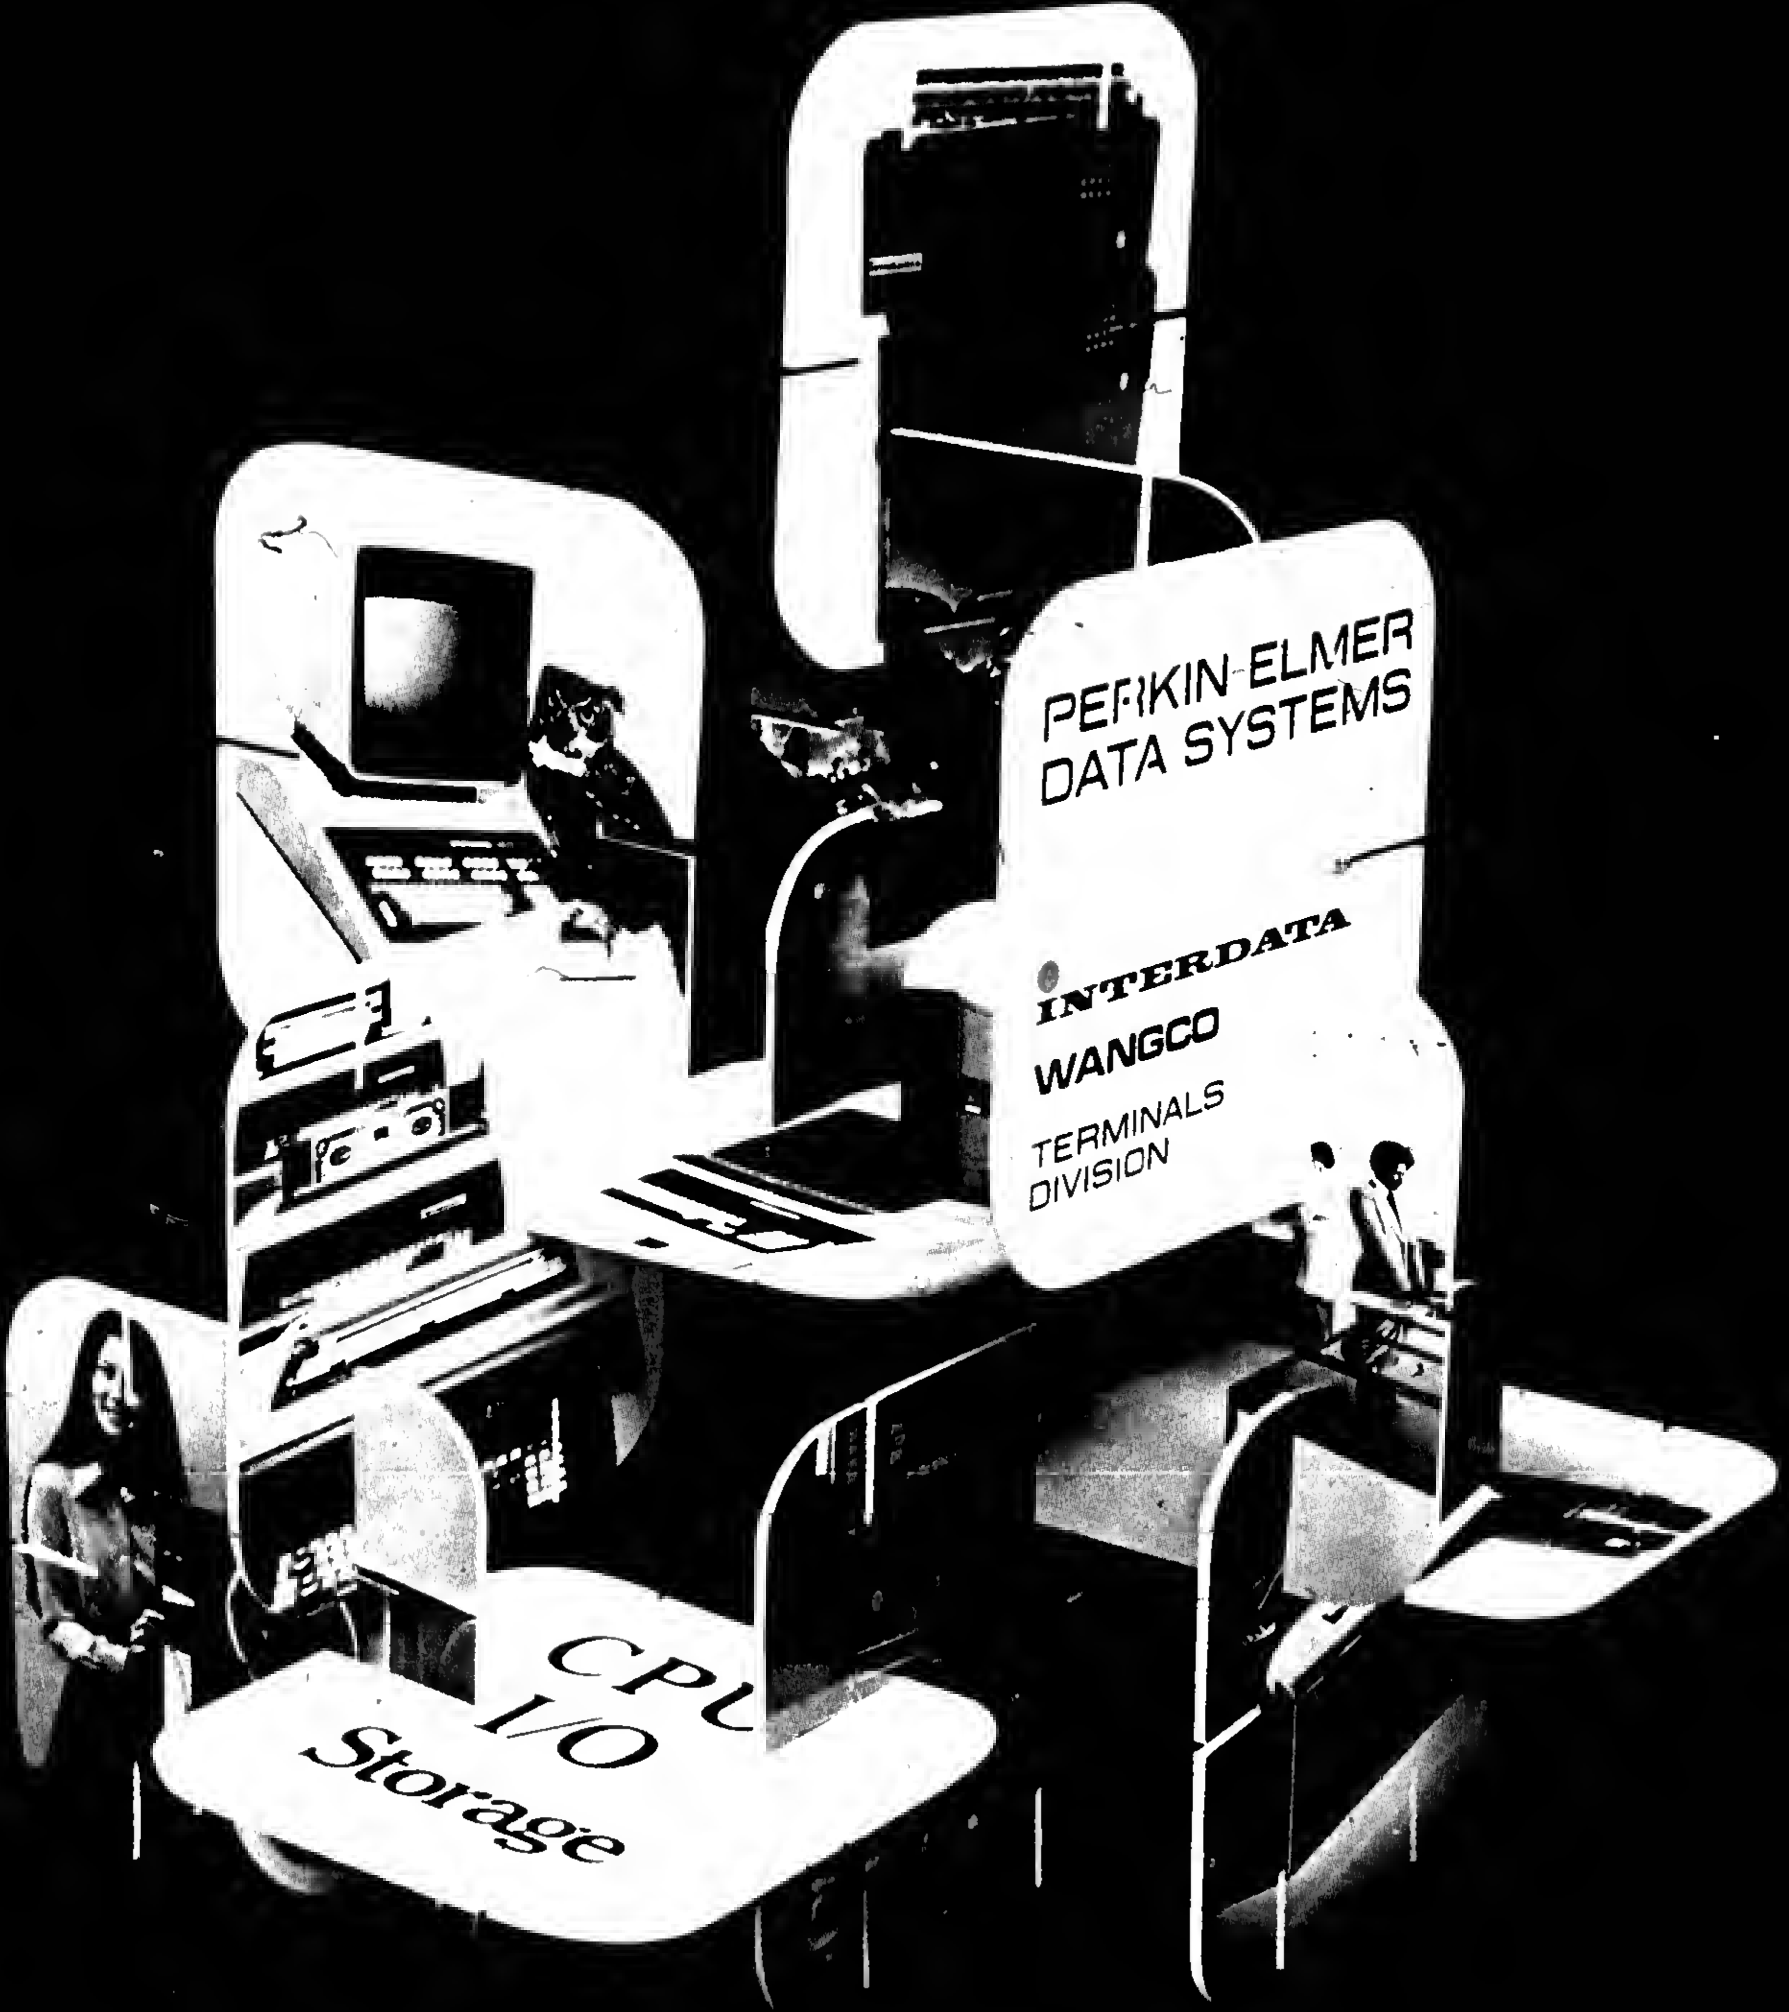
Perkin-Elmer: One Vendor For the OEM



Smart OEM's know the value of doing business with a single supplier. We at Perkin-Elmer Data Systems understand what it takes to be a single source vendor. Our Interdata, Wangco, and Terminals Divisions design, manufacture and service all of these products:

Small 16 bit computers
Powerful 32 bit computers
Multi-port memory systems

Magnetic tape drives
Cartridge disc drives
Floppy discs

Printing terminals
Basic CRT terminals
Editing CRT terminals

Our commitment to the OEM is to provide products of the highest quality, truly OEM priced, on time, in quantity, with consolidated service and support. Call us, and we'll show you how we can fill your OEM requirements with real savings. Call toll free 1-800-631-2154.

Net Incorporates Snap Protocol

TCTS Offering Datapac Service on a Commercial Basis

By John P. Hebert
Of the CW Staff

OTTAWA, Ont. — The Trans-Canada Telephone System (TCTS) has made available its Datapac packet-switched data communications network on a commercial basis.

TCTS' formal rate structure for the Datapac digital service was approved last month after being filed with the Canadian Radio-Television & Telecommunications Commission last November, a spokesman noted.

Charges for the service are primarily based on usage, but distance is also a consideration in Datapac's rate structures, he said.

Datapac uses computers to logically control the flow of information between most types of data terminals and remote host CPUs.

Datapac serving exchanges (DSE) have been established in 57 Canadian communities. Users in non-DSE areas can gain access to the network through an off-network access arrangement, the spokesman noted

Incorporates 'Snap'

The packet-switched network incorporates the Standard Network Access Protocol (Snap), which is based on the CCITT X.25 protocol.

TCTS customers using Datapac on a trial basis since last January have become the commercial network's first users, according to the spokesman.

All data on the network is transmitted in the form of packets of up to 256 characters each along intercity Dataroute digital facilities, he said.

At present, TCTS has an agreement with Telenet Communications Corp. and Tymnet, Inc. to provide U.S. users access to the digital service.

By mid-1978, TCTS plans to make the three networks compatible by integrating the X.25 protocol at the switching nodes and upgrading the nodes from temporary to permanent operation, the spokesman stated.

Network usage is primarily determined on a kilopacket transmission volume basis.

Between Toronto and Montreal, for example, data users with intelligent terminals using the Snap protocol will be charged 40 cent/kilopacket, the spokesman stated.

From Toronto to Vancouver, users will be charged 93 cent/kilopacket, while users transmitting data between Toronto and Ottawa will be charged 32 cent/kilopacket, he said.

Terminals not using Snap will require the usage of a network interface machine, which converts the "native mode" data from the terminal into Snap. It costs an additional 25 cent/kilopacket, regardless of distance, the spokesman noted.

A packet priority service on Datapac guarantees immediate transmission of user data and costs an additional 25% more than the normal rates, he said.

A host access charge on Datapac will cost a user $417.50/mo for a 9,600 bit/sec circuit and $60/mo for a 300 bit/sec circuit.

Cost, Control Factors Cited

Firm Scraps Old System for Remote Batch Net

By Esther Surden
Of the CW Staff

PHILADELPHIA — Increased control with a corresponding reduction of costs are two reasons often cited by DP managers for changing from one method of doing business.

These were the same reasons that prompted the management of Acme Markets, Inc. to scrap its potpourri of decentralized older equipment in favor of a remote batch network, according to J.R. Paules, Acme's manager of DP operations here.

Speaking before a recent conference here, Paules explained that prior to developing the net, the firm had a variety of equipment ranging from an IBM 360/40 and three 360/25s to an old IBM 1400 scattered between headquarters and the local divisions.

This decentralized approach led to no standardization of applications software and little control over DP costs, he told the attendees.

The company decided to install a remote batch network because "we wanted to reduce the total costs at the remote locations and eliminate duplicating people at each location, he said. The old equipment, especially the 1400, had become difficult to support and maintain, he added.

The firm decided it wanted to centralize control at the corporate location and implementing such a system takes specified steps, according to Bill Besnier, Acme's group leader for systems programming.

First the user has to decide how the system is going to be used, define I/O volumes and establish when the system will be used. Realistic service levels also have to be set, Besnier said.

Since the remote sites were already doing the applications, there was no need for Acme to theorize volume, Besnier indicated. Daily output figures were readily available and "we also know how long the billing system ran," he said.

The hours during which the system was to be used was established easily since all printing had to be completed by 8 a.m. so reports could be useful. In addition, the firm was "told by management that no terminal can be down for more than four hours," he said.

This requirement was so stringent that if the terminal is down for any length of time the firm will charter a private plane and fly the reports in.

Management also told the department that it would not staff for remote batch operations, he said. Unfortunately, there were few people already on staff with batch experience and because of this is was decided that any terminal chosen had to support IBM 2780 protocol. "It's been around for a long time and is a known," he noted.

Hardware Requirements

The next step was to determine all the hardware requirements, Bensier continued. For example, certain speeds had to be achieved on a card reader, he said.

(Continued on Page 26)

Correction

Omron Corp. terminals and Datamedia Corp.'s 1500 series terminals were rated highest in overall performance in the recent Datapro Research Corp. user survey contained in its report, "All About Alphanumeric display Terminals," [CW, June 13].

Telex Adds Printers in Response to IBM Moves

RALEIGH, N.C. — Telex Terminal Communications has responded in kind to the recent additions to IBM's CRT terminal, cluster controller and printer product lines.

Telex has introduced two printer products which are said to offer the user better price and performance than the IBM 3287 and 3289 printers [CW, May 23].

The firm also introduced a remote, cluster terminal subsystem and Synchronous Data Link Control (SDLC) capability Binary Synchronous Communications (BSC) for the Telex TC 241 and 3270-compatible product line; and price reductions for those 3270-compatible products [CW, June 20].

The Telex TC 287 is a 180 char./sec matrix printer that is said to be a 50% improvement in speed compared with its IBM 3287 printer counterpart. The TC 287 can replace the IBM 3284, 3286 and the 3287 models 1 the 2, according to Telex.

It can be attached to the Telex TC 271 or TC 272 cluster controllers or to IBM's 3271, 3272 or "properly configured" 3274 controllers, a spokesman stated.

Line Printer Capabilities

Telex' TC 289 is a line printer capable of operation at speeds up to 340 line/min — a top speed that is 13% faster than its IBM 3289 Model 2 counterpart, the spokesman said

TC 289s are available with a 64-char. set and can be optionally equipped with a 96-char. set.

The TC 289 can operate on the TC 271 2nd 272 cluster controllers, as well as with IBM's 3271 and 3272 or "suitably configured" IBM 3274 controller, he noted.

The TC 287 printer has 7 by 9 dot matrix characters. It costs $6,250 to buy plus $40/mo for maintenance and will be available in the third quarter.

Telex'TC 289 line printer is priced at $8,750, maintenance costs another $70/mo. The terminal also will be available in the third quarter.

Lease plans from one to five years are available, the spokesman noted, from 3301 Terminal Drive, Raleigh, N.C. 27604.

Ramtek Adds Graphics Terminal Controlled by Microprocessors

SUNNYVALE, Calif. — Ramtek Corp. has introduced an eight-color graphics communications terminal with microprocessor control of the display and user program areas.

The 6000 Series Micrographic Terminal is said to offer true graphics and high-speed alphanumerics overlay without expensive software development. It is also available in a basic black and white version.

Terminal Transactions

Terminal functions are controlled by a Z80 microprocessor with up to 28K bytes of programmable read-only memory and 16K bytes of random-access memory, the company stated.

A graphics resolution of 512 elements by 256 lines on up to three color planes is complemented by display of alphanumerics in 7 by 10 dot matrices in an 80-char./line by 25-line format, according to a spokeswoman.

The terminal's 128-Ascii-char. keyboard includes 40 function keys and cursor control for both the alpha and graphics screen presentations, the spokeswoman noted.

Transmission speeds from 110- to 9,600 bit/sec; full- or half-duplex operation, parity and on- or off-line operating modes are operator selectable, she said, adding the terminal can operate synchronously or asynchronously.

It also includes an RS-232C or current loop interface.

Options to the 6000 Series Micrographic include a floppy disk interface, additional serial I/O ports, user-defined formats and terminal control software packages:

A basic Micrographic costs $5,400; the black-and-white version is available for $4,700.

The company is planning to offer more applications software packages in 1978, the spokeswoman noted from 585 N. Mary Ave., Sunnyvale, Calif. 94086.

Trivex Has IBM 3775 Replacement

COSTA MESA, Calif. — Trivex, Inc. has announced the Model 0752 stand-alone data entry terminal, a plug-compatible replacement for the IBM 3775.

The terminal supports IBM 3784, 3786 and 3788 printers according to a spokesman. It offers features such as light pen, optical character recognition wand, in addition to user and customer engineer diagnostics.

The diagnostics are able to test the 0752 in the local mode and supply the user with network failure information when on line, he said.

The terminal costs $98/mo on a three-year lease and costs $3,950 to purchase, the spokesman noted from 3180 Red Hill Ave., Costa Mesa, Calif. 92626.

MCS Micro-Based Midas CRTs Support Communications, Editing

ELMSFORD, N.Y. — Mini-Computer Systems, Inc. (MCS) has expanded its CRT product line with the introduction of the Midas II and Midas III terminals, microprocessor-based devices which are said to support communications and text editing functions.

The Midas II has eight selectable transmission rates from 110- to 19,200 bit/sec, can operate in half- or full-duplex modes and supports on-line communications, according to an MCS spokesman.

It can display 24 lines of 7 by 9 dot matrix characters at an 80-character density per line. A 128-character display repertoire is also available, the spokesman noted.

Both terminals include an RS-232 or current loop interface.

The Midas III CRT has the same features as the Model II and also provides full keyboard edit, field attribute edit and a 2K paging option, the company stated.

The terminals are complemented by MCS' line of modular Deskware that reportedly permits users the opportunity to configure their systems.

The Deskware includes a contour-design workstation with a semicircular layout that was designed to increase operator efficiency, according to the firm.

The Midas II terminal costs $1,995 and the Midas III costs $2,245; the Deskware for either is another $230.

On 12-month rental plans, the Models II and III cost $85/mo and $95/mo, respectively, and the modular workstations are an additional $14/mo. MCS is at 525 Executive Blvd., Elmsford, N.Y. 10523.

Matrix Terminal for OEMs Expands Diablo Line

HAYWARD, Calif. — Diablo Systems, Inc. has added the microprocessor-controlled Model 1660 matrix terminal for OEMs to its communications terminal product line.

The terminal features 110-, 300-, 1,200- or 1,800 bit/sec transmission speed capabilities in Ascii code and a ballistic matrix print head with a wide head-to-paper gap.

The 1660's microprocessor helps provide incremental and bidirectional printing, horizontal and vertical tabbing, multiple selectable fonts, control code functions and forms handling capabilities, the firm added.

It prints 7 by 9 dot-matrix characters as well as upper- and lower-case characters and reportedly will print an original plus five or more copies using a 94-Ascii-char. sets, the firm noted.

The 1660 is said to be compatible with Bell 103A, 113A, 202 and 212 modems and other 110- to 1,800 bit/sec asynchronous modems using the RS-232C interface.

An internal print buffer is utilized, eliminating the need for "pad" or time-fill characters, Diablo claimed.

Three switch-selectable interface protocols are built into the microprocessor program which can be used to prevent data loss regardless of paper movement commands or other codes that might interrupt continuous printing operation, it added.

Basic Diablo 1660s cost $2,850 each in minimum quantities of 50 units. The company is located at 24500 Industrial Blvd., Hayward, Calif. 94545.

THE "SYSTEM"

The software systems house business is rough and tough, an extremely competitive marketplace. One with little margin for error. **Century Computer Corporation** has been in business only a few years. Yet, more and more software systems houses are becoming Century Computer sales representatives. **WHY?**

TOOLS. Up to 512K internal storage. Up to 256 ports. 10 to 300M disc drives. 200 to 600 LPM printers. Powerful operating system software, comprehensive programming languages. Turn-key applications packages.

RELIABILITY! Century Computer's mainframe maintenance is *free!* Period. Now that's quality. Quality only we provide. The others say they do, then turn around and charge $150 to $350 per month for mainframe maintenance. Makes you wonder, doesn't it?

SUPPORT. Complete documentation, both hardware and software. Thorough training for operators, programmers, and maintenance personnel. National and local advertising. Ongoing research and development, aimed at increasing efficiency and reducing costs.

VALUE. Century Computer's O.E.M. prices are low, extremely competitive. Coupled with our free mainframe maintenance, low initial cost makes Century Computer Corporation systems easily the best values ever. Bar none.

Why not hook up with a winning combination? Unlock the door to systems sales you had to turn down because of price considerations. Contact: Steve Sharrock, **Century Computer Corporation**, 2339 Stanwell Circle, Concord, Ca. 94520, (415) 798-8000.

IN **SYSTEMS**-HOUSES

Firm Scraps Older Equipment

(Continued from Page 25)

Choosing the communications lines itself was difficult. "We looked at various configurations" and discovered, "once you get high speed, the cost also gets high," he said. Full duplex, 7,200 bit/sec lines were selected.

The control unit that was chosen came from an independent vendor. Acme was not very satisfied with the IBM system available to it because it had no diagnostic ability: Software was a key choice, he added. The code used had to be not only standard but reliable too. Acme decided to stay with IBM's Rtam, he noted:

Because of the directive to minimize outage, the firm had to have redundancy, but couldn't spend any money to achieve it, Bensier said. All the systems involved then had to be easily serviceable or have built-in redundancy, he noted.

Deciding on a Terminal

Choosing the remote batch terminal was also a challenge, he said. After looking in *Datapro* and narrowing down the choices, Acme looked at IBM, Data 100 Corp., Remcon and Harris Corp.

IBM was "eliminated quickly" on the basis of cost, the fact that the 2780 and 3780 could not support the speed the company had determined was necessary, the 2922 was relatively new and Acme did not want to buy a new product, Bensier explained.

Both Data 100 and Remcon were left. Both were 2780-compatible, so the real decision was based on cost. Acme did look at the mean time between failure listed by the vendors, but "I found it very misleading," Bensier said. The user has to evaluate how that number is determined.

The Remcon system, which is now part of CMC a division of Pertec Computer Corp., provided a data compression feature which the firm found attractive.

The front-end processor was the next item to be selected. The DP department eliminated consideration of all programmable front-end processors because it didn't know enough about the communications software, Bensier said.

The choice was limited to a Memorex Corp. 1270 or the IBM 2701 which it found was limited in the number of terminals that could be handled as well as in diagnostic capabilities.

ISC Unveils Monitor, Color Graphics CRT

NORCROSS, Ga. — Intelligent Systems Corp. (ISC) has introduced an intelligent, eight-color terminal with graphics capabilities, in addition to an eight-color video monitor.

The Intecolor 8013 terminal has an Intel Corp. 8080 microprocessor, random-access memory refresh capabilities, a separate keyboard plus special graphics hardware and software. ISC offers a choice of 64 special characters with the 8013.

The terminal also comes with a CRT that can display 48 lines of characters at a density of 80 char./line, in addition to an RS-232C interface, the company added.

A front-mounted access door provides entry to a color convergence board for color setup and registration. Space is also provided for inserting an optional floppy tape and mini disk drive combination for additional storage, ISC said.

The Intecolor 813 monitor has been developed for OEMs and is said to provide systems manufacturers with an effective way to upgrade their systems' terminals to color.

The 8013 costs $3,495. The 813 is sold in quantities of 10 or more and costs $500 each in the minimum quantity, ISC said from 5965 Peachtree Corners E., Norcross, Ga. 30071.

Memorex Unveils Tape Subsystem For IBM 370s

DALLAS – Memorex Corp. introduced a magnetic tape subsystem here recently that includes 1,600- and 6,250 bit/in. tape drives and controllers for use with IBM 370/135 through 370/168 systems.

Memorex's 3220 subsystem – which is functionally equivalent to the IBM 3803 Model 2 and 3240 models 6 and 8 – consists of the models 3226 and 3228 tape drives and models 3221 and 3222 controllers, according to a spokesman.

The subsystem may be configured in several ways, depending on the number of controllers, the maximum number of tape drives and the particular installation requirements, he added.

Both the Memorex 3226 and 3228 tape drives provide dual density capability as a standard feature, allowing either 1,600 bit/in. or 6,250 bit/in. reading/writing to take place without operator intervention, he claimed.

When in read/write mode, the 3226 drive moves tape at a speed of 125 in./sec, yielding a data transfer rate of 200,000 bit/sec at 1,600 bit/in. and 781,250 bit/sec at 6,250 bit/in.

The 3228 tape drive, in read/write mode, will move a tape at 200 in./sec, yielding a data transfer rate of 320,000 bit/sec at 1,600 bit/in. and 1.25M bit/sec at 6,250 bit/in.

Memorex provides two tape controller models, the 3221 and 3222, to permit configuration flexibility, the spokesman said. Each controller contains a microprocessor to translate data, calculate and check the error correction code and direct status information to the system channel, he explained.

The microprocessor checks its own circuits and the tape drives during the machine idle loop. It runs diagnostics on the attached tape drives, he added.

Memorex's 3220 series consists of from one to four 3221 and 3222 controllers and from one to 16 3226 and 3228 tape drives per subsystem, in any combination.

With four controllers, four simultaneous data transfers can occur between any four of the tape drives in the string, the spokesman said.

A typical configuration consisting of one 3221 controller with optional channel switch, two 3226 tape drives and four 3228 tape drives costs $4,560/mo on a 24-month extended-term lease.

The same configuration can be purchased for $221,700 from the firm at San Tomas at Central Expressway, Santa Clara, Calif. 95052.

On-Line System Yields Bonus Benefits for Stores

DES PLAINES, Ill. – Ben Franklin Stores here reports "extraordinary benefits" since going on-line with a system to process vendor invoices for payment.

Cash position improved as did supplier relations. Employee turnover dropped sharply while morale rose and jobs were enriched. Buying and merchandising operations gained in efficiency and management confidence in overall computer support systems increased.

And in addition to all this, annual costs savings are running into tens of thousands of dollars, according to Donald Soderquist, president.

Installed last year, the on-line system unsnarled a mounting logjam in the matching of incoming invoices against open orders – a chore that is especially vital at Ben Franklin, Soderquist said.

However, he added, the impact of the "Controlled Order Invoice Network" (Coin) now extends well beyond the confines of the accounting department, reaching into many aspects of a dynamic business.

Liability Becomes Asset

"With the Coin, we turned a departmental liability into a business asset," Soderquist noted.

"In addition to solving a serious problem, we accomplished more with this system than we had ever anticipated. We now have the capability to cope effectively with a rapid growth pace that we expect will speed up more in the immediate future," he added.

Growth waa a principal factor in creating the invoice matching problem that had plagued the operation for some time. Ben Franklin, a division of City Products Corp., is embarking on a store franchising expansion program.

The expansion push is expected to add a minimum of a million square feet of retail store space annually, Soderquist said.

Along with the store expansion has been a steady growth and diversification in merchandise lines. With more stores to service and more merchandise to buy, the invoice matching workload reached gigantic proportions involving as many as 2,500 invoices a day, Soderquist pointed out.

The sheer size of the problem was compounded early in 1974 when Ben Franklin centralized all invoice and accounts payable processing for the eight distribution centers at division headquarters here.

'Severe Bind'

"With the centralization and the growing workloads, we got into a severe bind," James Battista, accounting systems manager, recalled. "Although our computer systems were sophisticated, our method of data input was archaic."

As a result, the activity of matching vendor invoices to Ben Franklin purchase orders – a necessary function to put them in line for payment – began to fall far behind the desired pace. The bottleneck steadily tightened to the point where it was taking as long as 18 days to clear invoices for closeout, Battista explained.

Changing a simple accounting routine like invoice matching would not seem likely to produce widespread advantages. Yet, at Ben Franklin Stores, going on-line with invoice matching has changed a department liability into a business asset.

The delays in invoice matching were unacceptable to management because of the importance the division places on taking full advantage of vendor discount opportunities. But there were other aspects of the problem.

The logjam proved self-perpetuating as the tempo of vendor inquiries requiring invoice receipt and payment status stepped up, creating more paper shuffling and information searches.

Labor costs in the department skyrocketed as more people were hired to handle the heavy workloads, and employee morale plummeted because of the menial types of processing activities involved with the manual invoice matching procedures, Battista stated.

"This situation grew so bad that there were some months in which we experienced a 100% worker turnover," he said.

In late 1974 the decision was made to "go on-line" with the invoice matching procedure, eliminating the hard-copy retrieval of open orders and the manual comparing of invoice and order details, according to Ron Walters, manager of DP.

This was accomplished by linking IBM 3270 visual display terminals to the IBM 370/145 CPU. The on-line hookup permits terminal display of any record on a processor-maintained open order master file, he noted.

The file record is created at the time the Ben Franklin purchase order is issued and is complete in all details, Walters said. Terminal operators can access the open order file by purchase order number, by merchandise item number, by vendor number or by promotion code.

Ten of the terminals located in the department are dedicated to invoice matching. Using the terminal and the Coin program, the operator can complete the matching and close out an invoice for payment in a matter of minutes.

Programming for Coin is such that the terminal operator is guided through every step of the invoice closeout procedure by means of instructions appearing at the bottom of the screen display.

"We designed the new system for ease of use and for positive control," Walters explained. "The computer itself makes all needed calculations for price extensions, discount and tax amounts.

"In the event of a terminal shutdown for any reason, the system will keep track of all prior transactions and then pick up where it left off when the terminal comes back on-line.

"Also, the Coin system interfaces with our purchasing system on the one end and with our accounts payable system on the other," he noted.

Ben Franklin is now saving thousands of dollars a month by taking full advantage of vendor discounts, Walters reported. Supplier relations, which had been deteriorating because of slow payments and difficulties in obtaining invoice status information, now are improved, he noted.

Labor cost savings in the invoice matching function are substantial, he said. The staff has been reduced from 31 to 10 employees despite the fact that invoice volume is higher by some 10%.

Dataproducts Adds Four Printers With Varying Print Technologies

DALLAS – Dataproducts Corp. introduced four printers here recently, each utilizing a different print technology:

The B-180 and B-300 line printers, which utilize a hammer and band technology; the M-200 impact matrix printer, which uses a dual column 14-wire head; and the T-80 thermal matrix printer made up the Dataproducts offerings.

The B-180 and B-300 line printers uses a steel-band font carrier and microprogrammed control to produce 180- and 300 line/min throughput respectively, according to a spokesman.

Both printers use the same font carrier bands, each holding 208 characters with a reported life of more than two years use in a typical application, the spokesman said.

A band-edge guide system provides adjustment-free vertical print registration and reportedly eases band changes, he claimed.

The printer electronics are centered around a microprogrammed controller that utilizes bit slice architecture. A butilt-in test feature enables tests to be run independently of host devices and a diagnostic display indicates the cycle the printer is in should failure occur, the spokesman explained.

Both printers use a stepper motor paper feed system to provide a slew rate of 15 in./sec. They both handle up to 6-part industry standard forms from 3- to 15 in. wide and up to 14 in. long, the spokesman said.

They will print at either 6- or 8 line/in. and will print to the bottom of the last form, he added.

Dataproducts will begin deliveries of both units in early 1978. The B-180 will be priced under $3,000 and the B-300 will be under $3,300 in OEM quantities, the spokesman said.

The M-200 uses a dual column 7 by 7 half-dot matrix font and a logic-seeking lookahead feature to product 320 char./sec in a bidirectional print mode, according to the spokesman. Users can expect throughputs ranging from 125 line/min with a 132-char. line to 300 line/min with shorter, 40-char. lines, he added.

132 Print Positions

The M-200 produces the standard Ascii 96-char. set plus an additional 32 commonly used international characters. It offers 132 print positions and can handle up to 6-part forms, he continued.

The 14-wire dual-column print head offers optional character spacing for condensed or expanded printing. The firmware controlled option permits user selection of 16.7-, 10-, 8.3- or 5 char./in.

The M-200 has a mean time between service calls of at least six months at a rated workload of 8.5 million char./mo, he claimed.

The unit will be available for deliveries in the second quarter of 1978. It costs under $2,000 in OEM quantities, he said.

Thermal Matrix Printer

Dataproducts T-80 is an 80 char./sec 80-column thermal printer that utilizes a 5 by 7 dot matrix for printing and a 7 by 7 dot matrix for plotting.

The unit has an 80 msec/line slew speed and incorporates a single-head print mechanism.

The T-80 will be available for delivery in May 1978 and costs $940 in OEM quantities, the spokesman said from 6219 DeSoto Ave., Woodland Hills, Calif. 91365.

Protecting the DP Center — Part 4

Contingency Planning Minimizes Emergencies' Impact

By Irving M. Cruper
Special to Computerworld

An emergency situation should not seriously impede the continued operation of required electronic DP.

The planning for continuation or resumption of operation should include:

- A program to protect records in accordance with their importance.

This is the conclusion of a four-part series on physical security of the computer center by Irving M. Crupar of the Wackenhut Corp. The series is extracted from a chapter in the Automatic Data Processing Handbook, *copyright 1977 by McGraw-Hill, Inc.*

In his conclusion, Crupar takes a look at contingency planning for continued computer center operations following an emergency situation. In past weeks, Crupar has discussed security needs, fire protection and electronic detection devices.

- An analysis of the workload and the effect upon continuity of operations, organized for each computer facility.
- Arrangements for emergency use of other installed computer equipment to cover plans for transportation of personnel, data, and supplies to an emergency computer location, in addition to agreements and procedures for the emergency use of the computer equipment.
- Programs designed with an adequate number of checkpoints and restarts to ensure rapid recovery to normal operations.

Personnel Instructions

All personnel should receive continuing instructions and review in:

- The method required for turning off all electrical power to the computer under both normal and emergency conditions.
- Turning off the air conditioning in the area.
- Alerting the fire department or company fire brigade.
- Evacuation of personnel.
- The location and proper operation and application of all available fire-extinguishing and damage control equipment, including automatic detection and extinguishing equipment. Computer-room personnel should be fully trained in carbon dioxide usage through actual operation of the equipment on a practice fire.
- The importance of records and their storage requirements.

A written emergency fire plan should be prepared for and posted at each installation, assigning specific responsibilities to designated personnel. The following major items should serve as a guide and are suggested as minimum features of this plan:

- Remove all power to the computer system. Provide a means, such as a main-line circuit breaker or equivalent. Provide a remote control for this purpose near the operator and next to each of the exit doors.
- Shut down the air conditioning system. This should be done if the main circuit breaker does not control the air conditioning system. Emergency means similar to those for the computer system should be provided.
- Notify proper authority. Building fire brigades should be notified immediately and outside fire-fighting companies should be called immediately to assist.

If the electronic equipment or any type of records are wetted down, smoky or otherwise affected by the results of a fire or other emergency, immediate action should be taken to clean and dry the electronic equipment.

If the water, smoke or other contaminations are permitted to remain in the equipment longer than absolutely necessary, the damage may be grossly increased.

Microelectronics Seen Directing Hard Copy's Future

By Frank Vaughan
Of the CW Staff

DALLAS — The future of hard-copy output devices depends on the utilization and enhancements of microelectronics, new materials and new manufacturing processes, as well as user's needs, according to Irving L. Wieselman of Dataproducts Corp., Woodland Hills, Calif., a manufacturer of such devices.

Speaking at a recent National Computer Conference session entitled "Output-Results and Rhetoric," Wieselman discussed hard-copy computer output and its future:

The principal hard-copy output of computer systems is alphanumeric data produced on computer output printers that range in speed from 10 char./sec to 18,000 line/min. The prices range from less than $1,000 to $300,000, Wieselman said.

Printers are classified by three characteristics: impact or nonimpact, character or line printer, shaped or dot-matrix characters, he explained.

In addition to hard-copy printers, there are three types of plotters in general use: the drum, flatbed and electrostatic, Wieselman said.

Certain types of computer output printers can be used for plotting if the printed symbol spacing can match the plotting requirements. Plotters are utilized for hard copy whenever graphical data is the prime output of the computer, he noted.

The particular choice of a hard-copy output device for a given system depends on the application, the print quality and/or graphic output requirements, the output volume, the speed of data availability and output speed capabilities, he said.

Additional criteria are the flexibility and availability of output character sets and symbols, system costs, expendable costs and the maintainability and reliability, he pointed out.

Various Technologies

In his discussion of hard-copy output devices, Wieselman discussed the various technologies that are generally being used.

The changes in price/performance for existing products in the past few years have primarily resulted from improvements in large-scale integration (LSI), new materials technology and production automation, he stated.

Products using new technolgies, such as ink-jet printers and laser beam electrophotographic printers are based on the refinement of new inventions and concerted investment in new development, he said.

The expanded use of LSI and the emergence of microprocessors have not only made dramatic improvements in existing products, but have also affected the way in which we conduct our day-to-day affairs, he added.

Use of Microelectronics

The use of microelectronics in hard-copy output equipment has not only reduced the cost of electronic control. It has provided more flexibility and increased use of electronics to perform functions which were previously handled by mechanical or electromechanical equipment, Weiselman said.

The reliance on a paper-tape reader for vertical format control was replaced by Dataproducts when lower-cost shift registers became available, he said. The firm plans to replace these with microprogrammed logic to provide additional flexibility, he claimed.

Dot matrix formed characters, which have the appearance of being produced from shaped character impact fonts, are possible because of the lower cost of storage. The IBM 6640 uses a dot structure of 24 by 40 (960 dots) now, as compared with other dot structures as low as 5 by 7 (35 dots), to produce characters, he said.

Cheaper Production

Possibilities for lower-cost production techniques using more plastics and less metal are emerging in products in the marketplace, Weiselman indicated.

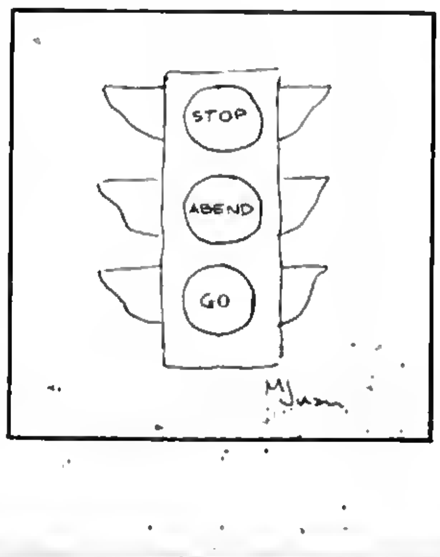
New magnetic materials are available which provide magnetic fields 50% stronger than those currently used, while new plastic materials and epoxies also mean lower cost mechanisms, he said.

The emergence of the laser beam as the energy source for character generation has affected both nonimpact and impact printing. The very high-speed impact printers will use laser character generation and other printers beside IBM's have recently been announced, he noted.

Ink-jet printers had been in the marketplace, but they were not successful because of reliability problems and non-competitive price/performance ratios, he explained.

IBM decided to invest in ink-jet technology and found solutions to many of the problems causing poor reliability. The electronic sophistication required to produce the high print quality of the IBM 6640 could only be possible with the use of microelectronics today, he added.

The use of finer dot matrix structures has also had an effect on graphical output, he said.



Last year, we introduced a new product every 15 working days.

Data General. And the Marketing Communications group.

That's the kind of activity that keeps Data General squarely out in front of the other mini makers.

And the kind that lets the Marketing Communications group grow — to include four more top-notch professionals in public relations, advertising, and sales promotion.

Each professional we're hunting for must know how to introduce products from state-of-the-art microprocessors to top-of-the-line commercial computer systems. Plus be able to solidly support ongoing campaigns with communications ranging from feature articles to product brochures and business ads.

PUBLIC RELATIONS

Senior journalist with excellent business/trade contacts and writing skills. Should have experience writing and placing articles about technical products and markets. Ideal candidate will have 5-10 years experience, preferably in the computer and/or electronics industry.

ADVERTISING SUPERVISOR

Will be the prime liaison between Data General and Ingalls, for all business and trade advertising in support of the company's marketing activities. Should have excellent understanding of creative process, developed by 7-9 years advertising contact experience in agency and/or a corporation. Also needs solid understanding of electronics/computer industry.

SALES PROMOTION ACCOUNT SPECIALIST

Senior writer to set direction and produce creative, market-specific copy for company's sales promotion collateral — brochures, trade shows, direct mail, spec sheets, audio visual, application notes. Should have 5-7 years copy and contact experience in the electronics/computer industry, with solid understanding of art and production coordination functions.

If you want the challenge, send your resume, complete with salary requirements, to Mr. Kevin Steele, Data General Corporation, 15 Turnpike Road, Westboro, MA 01581.

DataGeneral

An equal opportunity employer M/F

Mini Bits

BTI Business System Gets Increased Disk Capacity

DALLAS — Basic Timesharing, Inc. (BTI) has enhanced its minicomputer business time-sharing system with the introduction of a 10M-byte non-removable disk drive, a heavy duty 3M Co.-type cartridge tape drive and a line of printer options.

The 10M-byte disk replaces a 7.5M-byte Diablo-type drive previously available for the system. The increased capacity was given at no charge to the user, a spokesman said.

In addition, the firm is shipping a 3M-type cartridge tape drive that runs at 6,400 bit/in. as a backup medium.

A 300 line/min, 132-col, 96-char. medium-duty line printer and controller costs $8.950.

A heavy-duty 300 line/min, 136-column 64-char. unit that includes a vertical forms unit, static eliminator, active ribbon deskew, paper motion sensor and paper holder costs $8,950.

A 600 line/min version costs $18,500, while a 900 line/min unit can be purchased for $23,700.

Basic Timesharing is at 870 W. Maude Ave., Sunnyvale, Calif. 94086.

AIIE to Host Conference On Mini Applications

NEW YORK — A conference on "Minicomputers — the Applications Explosion" will be held here July 18 to 20.

Sponsored by the American Institute of Industrial Engineers (AIIE), the conference is addressed to executives and professionals concerned with current and potential applications of minicomputers either from the DP or the user point of view, a spokesman said.

The conference costs $265 for AIIE members and $295 for nonmembers.

Information is available from AIIE Seminars, P.O. Box 3727, Santa Monica, Calif. 90403.

Short Course to Examine Personal, Micro Systems

JAMAICA, N.Y. — St. John's University here is offering an intensive short course on personal computers and microcomputer-based business systems.

The course will review the state of the art in current microcomputer technology including both hardware and software design as well as numerous applications of personal computing in education, recreation and business.

It will meet every Tuesday from 6 p.m. to 8 p.m., Sept. 27 to Oct. 18, and will cost $29. For further information contact Dean Patrick Basilice, Evening Division, St. John's University, Jamaica, N.Y. 11439.

While Constroversy Rages

Minis Help Nuclear Waste Researchers

By Esther Surden
Of the CW Staff

IDAHO FALLS, Idaho — While controversy rages over the environmental impact of nuclear energy, scientists at Allied Chemical Co. here, armed with desktop minicomputers, are trying to find an effective, economical alternative to present methods of handling nuclear wastes.

With environmentalists concerned about the dangerous waste products left after the uranium is processed and energy conservationists worried about the inefficient use of fuel, studies here could have a wide-ranging impact.

"The object of our research is to verify the various processes that put it [nuclear waste] in the form of solid waste rather than liquid waste and to demonstrate that these processes can be done safely with a minimum impact on the ecological system," acording to Dr. Harry Lawroski, assistant general manager of the Idaho Chemical Program at Allied.

Another object is to "recover the uranium, which is very valuable," he added. With some modification, the techniques developed at the lab can be applied to other nuclear installations. "We are proving these techniques — proving that they can work and they have worked," he stated.

All the fuel used in the experiments at Allied "comes from the Energy Research and Development Administration — from research reactors at universities, for example," he said.

Laboratory Uses

The desktop minicomputers are used in laboratory operations ranging from chemical analysis to budget monitoring. Some of the systems are interfaced to monitoring and data acquisition instruments such as mass spectrometers, flame spectrometers and pulse height analyzers.

"Ten percent of our 550 employees do their own programming," according to Harry Deveraux, group leader for instrumentation applications.

"The presence of portable computing systems allows chemists to get on-line quickly and solve problems without the waiting experience associated with single large systems. Nontechnical people can also run programs and acquire meaningful data," he added.

Allied uses 12 Hewlett-Packard Co. systems including one HP 9810, eight 9830s and three 9825s. The systems were purchased as a result of a bid situation, according to Lawroski.

Typically, the systems are used to control instruments. In one application, for example, a system is interfaced to a carbon rod-type atomic absorption spectrometer, Lawroski said. Small carbon rods are charged with the elements under study.

Through the interface, the system controls heating the rods at rates up to 300 degrees C per second. While the sample is atomized, the system acquires and evaluates the resulting data.

Another system is used for effluent studies — tests which look at various types of radioactive fission products, seeking ways to contain them.

A recent test determined the durability of crystalline zeolite, an encapsulant medium for radioactive krypton, for example. The system evaluated the leak rate of the crystals at various temperatures and pressures.

Nuclear plant simulation is also an important part of Allied's research, according to Dr. John Baldwin, supervisor of Allied's Analytical Research Section.

Plant design and utility routing must consider system safeguarding as well as structural factors, Baldwin said. Such a seemingly simple operation as routing a pipe becomes complicated when the transported material is radioactive. The smallest leak can have serious consequences.

Desktop system monitors mass spectrometer at Allied Chemical Co.

"The interfacing computations were designed to accomplish two things: to reduce the possibility of human error and to save the chemist from the tedious process of manually collecting and analyzing data," Baldwin explained.

ICL Offers 220 Series CPU As Singer System Ten Upgrade

By Esther Surden
Of the CW Staff

EAST BRUNSWICK, N.J. — ICL, Inc. clarified its commitment to the Singer Business Machines System Ten user base last week with the introduction of the 220 series, described as an upgrade path for those users.

The ICL-developed processor features the same design principles as the earlier System Ten series processors but with a faster processor cycle time than its predecessors in the 110 series. Core capacity and disk handling facilities have also been enhanced on the 20, according to a spokeswoman.

The system "protects the investment" of current System Ten users because they can run their software and peripheral devices on the 220 without modification, the spokeswoman said. In addition, "many existing processors can be upgraded" to become the Model 220 system, she added.

The ICL 220 CPU is already available to European and South African users. It is designed for the same type of user who used the System Ten — those primarily concerned with business applications such as order processing, invoicing, accounting.

The core memory capacity of the system has been increased from a maximum of 110K 6-bit char. to 160K char.

The System Ten processor consists of fixed hardware partitions with each partition's core size determined and set in the field.

Up to 20 partitions can be handled by the system, but the maximum memory size of each partition on the older processor was 10K char. With the enhancements, each partition can accommodate up to 80K char. of memory.

Memory locations in common to all users have been increased from a maximum of 65K char. to a maximum of 80K char., the company added.

To upgrade peripheral capacity, the company introduced two disk drives. The Model 43 is a fixed/removable device with an 8M-char. capacity, while the Model 44-3 is a 20M-char. drive.

Total on-line disk capacity for the system has increased 60% to 160M char.

Software enhancements include improvements to the Disk Management System, DMF2, which are said to take advantage of processor improvements to increase data management efficiency. The company will also provide enhancements to the assembler, sort functions and RPG-II software on the system.

A typical ICL system with 20K char. of memory, a 1920-char. CRT, an 8M-char. disk drive with 4M fixed and 4M removable and a 165 char./sec serial printer costs $39,000.

A model with a dual disk pack with 8M char. of removable disk pack costs $36,500, a spokeswoman said from the firm at Turnpike Plaza, 197 Highway 18, East Brunswick, N.J. 08816.

PDP 11/70?

Synercom Technology, Inc. can provide quick delivery of turnkey 11/70 systems with superior performance and save you money in the process.

We provide turnkey systems with full service maintenance and warranty with top of the line peripherals including:

•Large capacity disc drives •Tape drives •Card readers •Line printers
•Plotters •Graphic CRT's and Digitizers •Alphanumeric terminals

We also offer application software and interactive graphics software. For more information call or write:

Synercom Technology, Inc.

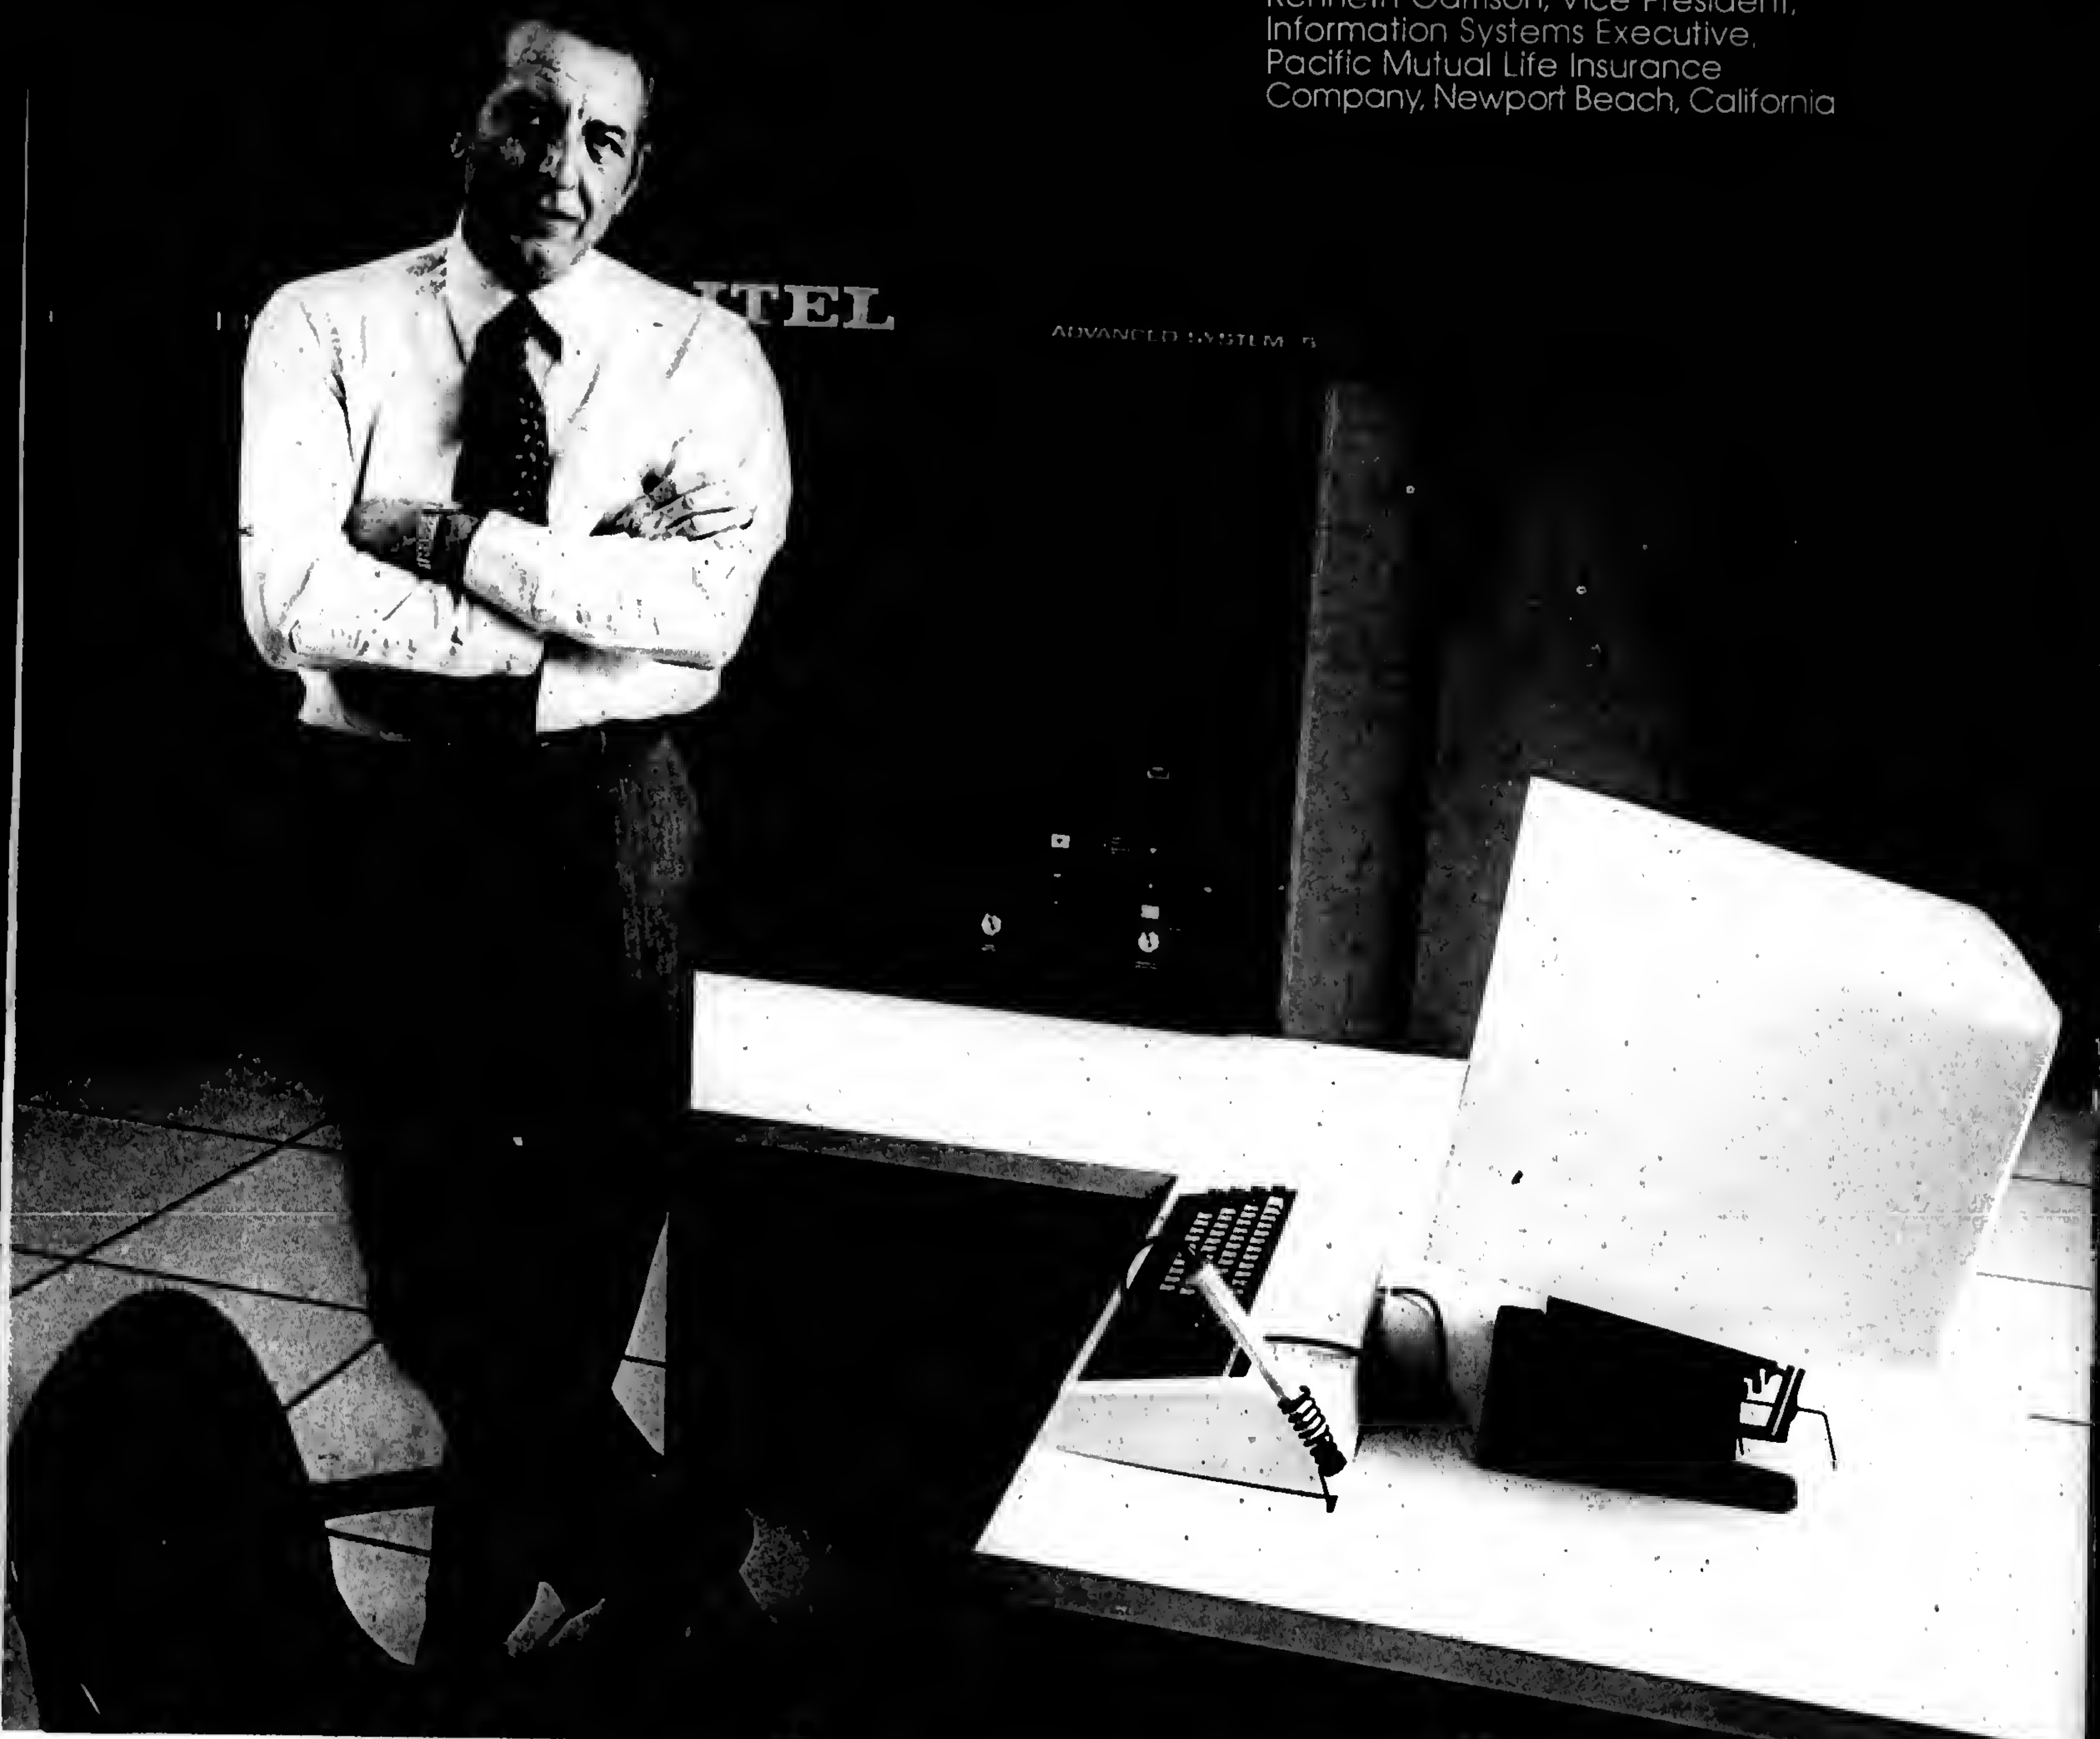
Houston, Texas 77081/713/772-1991/Telex: 775-619

"Very impressive... Itel's Advanced System was installed and fully functional within three hours and fifteen minutes!"

Kenneth Garrison, Vice President,
Information Systems Executive,
Pacific Mutual Life Insurance
Company, Newport Beach, California



"Itel's record installation time was outstanding, especially when ours was the very first Advanced System to be installed. And its performance has proven to be as impressive as its installation.

"With more than $1.7 billion in assests to manage, you can imagine the variety of complex tasks to which we put our EDP equipment. Of course, we knew we could expect performance from the system. Before replacing our IBM 370/155 with Itel's AS-5, we conducted extensive pre-installation tests to determine compatibility, reliability and error correction capabilities of the Advanced System. And all tasks were completed in equal or faster time compared to IBM's 370/158.

"Also contributing to our decision was the fact that the Advanced System would protect our investment in programming, documentation and personnel training. So, not only did we save on initial cost, but we're saving money in the long run, too.

"Choosing the AS-5 was a good move—we've been thoroughly pleased with the Advanced System and with Itel every step of the way. We sincerely feel that Itel deserves every accolade possible for the quality and reliability of their Advanced System, and the quality and professionalism of their people."

"Incredibly enough, we made no software changes at all when we put the Itel Advanced System™ into production."

ITEL
ADVANCED SYS

Dr. Clair G. Maple, Director of
Computation Center, Iowa State
University of Science and
Technology, Ames, Iowa

"We're thoroughly pleased with the AS-5. Installation was completed with remarkable speed, and its performance has been outstanding. We're quite proud that Iowa State is the site of Itel's second Advanced System installation.

"We were initially receptive to the AS-5 because there seemed to be economic advantages involved. We saw the opportunity to replace the IBM 370/158 and to increase memory size, add secondary storage, upgrade our magnetic tape system and modify the CPU to a model III, all within a price range we could afford. And to be able to do all that without software modifications and without utilizing more space is positively remarkable.

"Here at the university, our Advanced System has between fifteen and twenty thousand users. It handles a wide range of activities–from course-related student programs to university-generated academic research. And its performance has been very impressive.

"In fact, we've been very favorably impressed in all areas of contact with Itel–from the outstanding performance of their products to the professional standards of their personnel and the excellence of the service they've given us."

Harris Broadens 1600 Series Offerings

DALLAS — Three miniprocessors, two key-to-disk software packages and auxiliary memory have been added to the Harris Corp. 1600 family.

The three processors - the 1650, 1660 and 1680 — are filed-upgradeable from the existing 1610 and 1620 processors.

The 1600 family can integrate batch and interactive hardware and software into a single, centralized, controllable system, Harris claimed.

The 1650 processor, primarily intended for key-to-disk data entry applications, can operate up to eight key entry terminals concurrently with remote job entry communications to central host computers. Its memory is expandable to 96K bytes, according to the firm.

The 1660 can perform a variable mix of remote job entry, batch Cobol, key entry and interactive applications.

The 1680 is a dual-processor configuration that enables a user to combine any two 1600 family models into a single unit.

The auxiliary memory is available in 16- and 32K-byte increments and is said to enable 1650 and 1660 processors to be used in 64K-, 80K- and 96K-byte configurations.

The key-to-disk software packages introduced — Format/10 and Format/41 — enable a 1600 system to process intermixed format- and program-driven applications, the spokesman added.

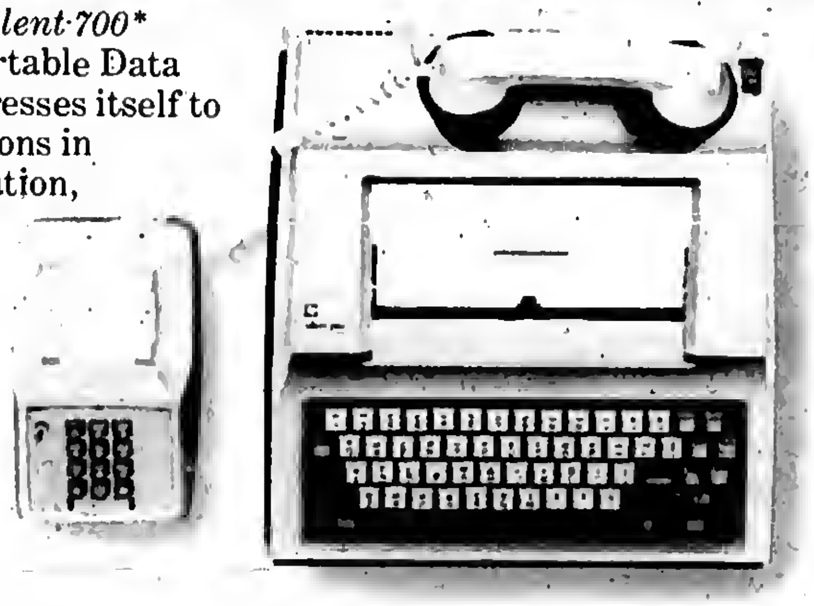
Typical System Prices

A typical Harris 1650 system including four key stations, 64K of memory, a 6M-byte disk, a 300 line/min printer and 9,600 bit/sec communications leases for about $1,770/mo including maintenance and sells for $60,720.

A 1660 with eight CRTs, 96K of memory, a 12M-byte disk, a 1,200 line/min printer and transmission handling capabilities up to 19.2 Kbit/sec costs about $3,572/mo, including maintenance, and can be purchased for $128,888.

Pricing for a 1680 depends on the processors combined and the configuration, Harris noted.

The Format/10 software, the processors and auxiliary memory is available now. The Format/41 key-to-disk software is scheduled for release in July and the 1680 dual processor is slated to be available in August, Harris said from 11262 Indian Trail, Dallas, Texas 75234.



Introducing a new set of characters.

TI's Model 745 is now available with APL.

Now, the *Silent 700** Model 745 Portable Data Terminal addresses itself to your applications in science, education, business and finance. And other programs requiring APL.

And since we're in character with your needs, you'll be able to understand the other benefits that have made the 745 the most popular portable data terminal on the market.

TI's 745 offers you fast remote access to your central computer. With lightweight 13-lb. briefcase mobility.

The terminal itself interfaces by way of a built-in acoustic coupler or an auxiliary EIA port. With virtually silent printing at 30-character-per-second data transmission rates. And a rugged TI microprocessor-based design.

The 745 with APL features half or full duplex operating modes. Standard parity options. And ASCII/APL keyboard. With readable font, true underscore and real back-space key.

To find out more about TI's 745 with APL, or our desk-top Model 743 KSR with APL, simply fill out the coupon and mail today. Or call your nearest TI sales office.

The 745 translates into a better solution for your APL needs.

Vendors' Units Micro-Based

DALLAS — Several vendors brought user-oriented microprocessor-based systems to the recent National Computer Conference here.

The Mupro-80D introduced by Mupro, Inc. is a microcomputer-based system with a floppy disk drive.

Designed as a general-purpose system or for software development, the system supports multiple terminals for simultaneous program development by more than one user, Mupro said.

The system runs the Mute software package, described as a disk operating system that supports the firm's Bsal-80 software consisting of a relocating block-structured assembler, linking loader and text editor.

A 32K-byte Mupro-80D costs $7,900 from the firm at 424 Oakmead Parkway, Sunnyvale, Calif. 94086.

Personal System

Micromega Corp. unveiled its Micro M16, described as a fully assembled and tested 16-bit personal system.

The system can accommodate up to 60K 16-bit words of memory contained on boards that can be populated with 32K bytes. The CPU is a National Semiconductor Corp. Pace microcomputer that features six vectored priority interrupt levels and a buffered 16-bit address/data bus.

Software includes Pace Basic, an 8K macro assembler that generates relocatable and linkable code, a conversational editor, a linking relocating general loader, a debug program and a "mini-monitor" which writes onto cassette, loads from cassettes, scans memories and executes from start address, the company said.

Micro M16 costs $3,750 from the firm at Suite 12, 1131 Stemmons Freeway, Dallas, Texas, 75229.

Ehnek, Inc.'s Ehnek 77 is based on the TMS 9900 from Texas Instruments. A basic system includes 16K bytes of random-access memory and a 4K-byte operating system stored in erasable programmable read-only memory.

A cassette tape transport and video graphics terminal are also included in the basic system, the firm said.

An Ebnek 77 can be interfaced to standard peripherals. Memory can be expanded to 128K bytes in the system's cabinet.

The system costs $3,800 assembled, the firm said from 254 N. Washington, Wichita, Kan. 67202.

COMPUTER INDUSTRY

CI Notes

Commerce Nixes CDC Sale Of Cyber 76 to Soviets

WASHINGTON, D.C. — The Commerce Department has blocked the sale of a Control Data Corp. Cyber 76 to the Soviet Union on grounds it could be put to military use.

CDC termed the denial "political."

The export license was denied "because [the Cyber] is far more powerful than any computer known to be available to the Soviet Union [and therefore] the likelihood of diversion to military or strategic uses is of serious concern," according to Commerce.

Safeguards to detect and prevent such diversion "were found completely ineffective by a government task force," the department added.

The computer was ordered in 1975 for weather research.

"We believe the Administration decision is essentially political rather than being based on sound technical grounds," a CDC spokesman said. "The decision is not surprising in view of the recent, almost daily, leaks of selected negative data from the evaluation personnel's classified report.

"Although it is couched in terms to indicate a thorough study was done, the decision was based on very narrow grounds that we believe will not stand up to close examination," he said.

CDC may appeal the decision, he added.

Memorex Makes STC an Offer

SANTA CLARA, Calif. — Memorex Corp. has made a formal offer to acquire Storage Technology Corp. (STC).

Memorex offered to exchange .725 share of its common stock for each STC common share. Based on Memorex's closing price on the Pacific Stock Exchange, the offer is valued at about $75.5 million.

STC is considering the offer, but indicated an agreement in principle has not been reached yet.

AMI, German Firm Ink Pact

SANTA CLARA, Calif. — American Microsystems, Inc. (AMI) and Robert Bosch GmbH have signed a five-year joint development agreement under which AMI will design metal oxide semiconductor parts for Bosch's products.

In addition, Bosch will acquire 747,000 shares of unissued authorized-buy AMI stock for about $14.2 million, thereby acquiring 25% of the U.S. firm.

Wema Cancels Show

PALO ALTO, Calif. — The Western Electronic Manufacturing Association (Wema) has cancelled plans for Microfair '77, a combined educational seminar/product exhibit originally scheduled for this October.

Wema Chairman Kenneth Oshman said he was advised by executives of Fairchild Camera & Instrument Corp., Intel Corp., Motorola, National Semiconductor and Advanced Micro Devices that their firms are not interested in the show.

Chief executives of these five semiconductor companies recently announced formation of a new Semiconductor Industry Association, but said at that time they would continue membership in Wema as well.

Investors 'Overreacted' to IBM

DP Stocks Seen Rebounding by Year-End

By Molly Upton
Of the CW Staff

NEW YORK — Although the DP industry's stocks are performing below those of the Standard & Poor and Dow Jones Industrial averages, this should change in the latter part of the year and into 1978, according to a report from L.F. Rothschild & Co., a brokerage firm here.

The investment community appears to have "overreacted" to IBM's mainframe and memory pricing adjustments and announcements, the report said.

IBM's action differed little from past moves, the report indicated, "but the way it has been done has confused the outside observer.

"One could speculate that, had IBM advertised its new equipment as another generation and introduced it somewhat earlier, the stock market would be greeting the announcements with as much enthusiasm as computer users," the report continued.

Recovery Delayed

Rothschild postponed from 1977 to 1978 the time during which the DP industry would equal or outperform the Standard & Poor averages for three reasons.

These included downward revisions in 1977 earnings projections, especially for IBM and Burroughs; the skittishness of investors caused by the recent IBM announcements; and investor disenchantment with low-yielding multinational companies in general.

As reasons for its belief that the industry's stock performance will rebound, Rothschild cited the strong order rates of both minicomputer and mainframe firms and increased demand, especially for memory, as a result of lower prices, increased applications and the move to distributed processing.

Furthermore, "we believe that IBM's efforts to 'relocate' whatever profits may have been lost [from mainframes and memories] to other areas within the total systems bundle will prove manageable for IBM's major competitors," Rothschild remarked.

The total systems competitor that offers hardware, software and services "will have sufficient flexibility to take advantage of the higher price umbrella IBM is creating in such areas as field engineering services and software changes," the report observed.

In addition, customer defections from a manufacturer are expected to be "relatively modest on a net basis" as in the past, the report stated.

Time to React

IBM's competitors should have some time in which to formulate reactions because at least 70% of the non-IBM installed rental base is covered under three- to five-year leases, according to the report.

"True, IBM's price adjustments on existing installations will result in some near-term revenue and profit dislocations for the other mainframers as they follow IBM's lead and selectively reduce prices. However, the more important consideration for the longer term is preservation of the customer base," the report said.

The actions by IBM are not solely indicative of a price war, although they were made partially in response to competition from memory and plug-compatible CPU makers, the brokerage house indicated.

The moves principally reflect "historical price performance improvements and 'catch up' on the product cycle timing curve. Thus we believe IBM had been a bit tardy in making its 'normal' adjustment in the 1974- to mid-1976 period," Rothschild stated.

Much of the incremental demand for DP power will stem from the trend toward decentralization, Rothschild indicated. The interaction of remote units with a central mainframe should also fuel demand for larger central memories, as will the increased use of systems by non-DP persons, the report said.

Focusing on IBM's entry into the minicomputer marketplace, Rothschild said it should be possible for other well-managed mini makers to grow at about 25% over the next several years, even if IBM's market share rises substantially.

SBS Clears Regulatory Hurdles, Now Faces Legal Ones: Edelson

By Toni Wiseman
Of the CW Staff

NEW YORK — Satellite Business Systems [SBS] has hurdled a series of regulatory obstacles in its quest to achieve operating status as a domestic common carrier," but two legal hurdles remain ahead on the obstacle course, according to Harry Edelson.

Edelson, senior analyst at Drexel Burnham Lambert, Inc., noted SBS still faces a possible U.S. Court of Appeals review of the Federal Communications Commission's (FCC) approval — a review petitioned for by several interested parties including the Justice Department — and a Justice Department antitrust investigation.

"Those two legal actions are closely related, and it is increasingly apparent the Justice Department is the last major roadblock for SBS," Edelson stated.

Justice vs. SBS

Edelson said it is ironic the Justice Department initiated an antitrust investigation of SBS on the heels of a similar action against AT&T in 1976 — two bodies which are basically competitors.

He further suggested Justice is less worried about the entry of IBM into the domestic satellite arena than it is about the joint-venture aspects of SBS. Edelson cited a filing in which Justice said:

"The entry of IBM into the domestic communications field could inject an aggressive, well-financed new entrant into a market too long dominated by a monopoly supplier . . . Even if a new entry in satellite communications were to be procompetitive, the [FCC] must determine whether this gain is outweighed by the loss of significant potential competition a . . . joint venture [between Communications Satellite Corp. (Comsat) and IBM] may entail."

The filing went on to say that IBM would probably enter the market in any case, resulting in competitive benefits and lacking the anticompetitive effects "implicit in the proposed joint venture," and Comsat would remain a potential entrant.

Since the Justice Department failed in its bid to have the FCC establish a complete factual record, it will establish the record itself, Edelson stated. To this point, he noted, civil investigative demands (CID) have been served on SBS, IBM, Comsat and Aetna to determine whether the SBS joint venture violates Section 1 of the Sherman Act or Section 7 of the Clayton Act [CW, June 6].

The CIDs, Edelson observed, are related to matters such as correspondence between AT&T and IBM on satellites, the choice of partners and organizational structure of SBS and CML Satellite and studies showing the expected effect of domestic satellite services on IBM.

Catch-22 Situation

Looking at the IBM/Comsat joint venture, Edelson recalled the FCC gave IBM three options:

- Add a third partner, with no one partner controlling more than 49%.
- Enter the domestic satellite business with a 100%-owned subsidiary.
- Buy circuits from Comsat or others.

"In what was probably a Catch-22 situation, as far as Justice Department intervention was concerned, IBM chose the joint-effort option over sole-ownership option. It is likely IBM reasoned the joint-effort option would create less industry opposition and, therefore, have a greater chance of gaining regulatory approval," Edelson stated.

"If the Justice Department eventually files an antitrust suit against SBS because it believes Comsat and IBM should be free to enter the domestic satellite business inde-

Adapso's Dreyer Says

International DP Body Needed

By Toni Wiseman
Of the CW Staff

DALLAS — A call for a lobbying effort on the part of European users and for the formation of an international policymaking body composed of data processing organizations was issued here recently.

The problem of telecommunications networks and of the privacy and security of the information passing through them and across national boundaries affect everyone, Jerry Dreyer, executive vice-president of the Association of Data Processing Service Organizations (Adapso), told attendees of the On-Line International Conference.

"While we continue to improve technologies enabling data to be sent around the world, we enact laws which restrict the kind of data we can send, often destroying the very services we set out to perform," he said, referring to some privacy laws which would make computerized airline reservations an illegal infringement of privacy because names and flights would be linked in the data base.

"Obviously, we have not yet found the appropriate trade-offs — the balance between what society demands in the way of service and what it demands in the way of privacy," Dreyer said.

Success calls for sophisticated data communications networks, he observed, and these networks must operate under uniform world communications standards.

"Just as we in the U.S. are at long last accepting the metric system as the standard measurement, similarly we all must move toward an international standard in the important field of communications and, I argue, it must be a high standard, one that data processing organizations can use," he stated.

Cooperation Urged

Dreyer pointed out that if U.S. and European DP organizations do not act in a unified manner on these matters, "we will find that the initiative has been seized by other groups and that the results will be difficult

(Continued on Page 34)

'Applications Houses' Booming as OEM Clients for CDC

By Molly Upton
Of the CW Staff

DALLAS — The "applications houses" market for OEM products has been growing at a tremendous rate for Control Data Corp.'s Peripheral Products Co., according to Dale Showers, vice-president of OEM marketing.

Although known principally for its disk products, CDC's OEM line also includes terminals, printers, an optical character recognition reader and media; it will soon include tape drives, he indicated in an interview here recently.

CDC's OEM business started picking up after the recession when it changed its marketing thrust from large companies to include smaller customers, he said.

In 1975, about 10% of its customers accounted for about 90% of its business. But CDC saw the minicomputer boom coming and substantial mainframers exiting business and put a major emphasis on sales in the mini area, he said.

CDC classsifies its OEM customers into four types: large; mini manufacturers; applications houses; and the large account that might consider an end user.

Rather than refer to CDC's fastest growing class of OEM customers as systems houses, Showers calls them applications houses because what they really are selling is specialty in specific applications, he explained.

Services Offered

In addition to its range of products, CDC offers other services to these firms, many of which are young. Its service affiliate, Syntonic, offers service for other firms' products on a contractual basis in 12 cities and plans to expand to at least 18 locations, Showers said.

In addition, CDC is starting to offer financing to firms through its Commercial Credit Co. (CCC) operation. Showers observes it is often difficult for firms to obtain financing from banks for inventory, and CCC could fill that need.

In selling to large end-user customers on an OEM basis, the company has strict criteria firms must meet in order to qualify for OEM purchases, Showers said. They must be in the business to resell products; be repetitive in volume; and add value to the product.

In order to increase the distinction between the OEM group and the rest of the company, there are very few products marketed by both. One exception is the 400M-byte disk drive, he admitted.

The disk business comprises the major part of CDC's OEM volume, he indicated.

More Than Disks

"One of the problems is that people don't know we're in other OEM areas," Showers continued. "We're more of a force in terminals than people realize."

CDC's share of the OEM printer market, took a dip, but Showers expects it to increase again with the addition last year of a band printer, which he said is superior to other 300 line/min printers.

In terminals as well as printers, the current emphasis in the marketplace seems to be on flashy items such as low cost or speed, he said.

But in the long run, quality is going to be a very important factor; the market is coming to recognize the need for quality, for fully formed numbers in printed characters and for terminals designed with human engineering factors, he said.

There are several reasons for CDC's success in the OEM arena, he indicated. The first is the reputation for quality. People also know CDC will be around in the next five or so years, and salesmen have a full line of products, he continued.

In addition, the firm offers worldwide capability, which is very important in the OEM field, he added.

Dreyer Calls for Worldwide DP Policy Body

(Continued from Page 33)

for us to live with.

"In fact, without the kind of unified action I suggest, doing business will be more costly, less efficient and, in some cases, impossible," he stated.

Dreyer urged Europeans to implement a lobbying effort in their own countries, similar to what Adapso attempts in the U.S., to make their needs forcefully known and taken into account by their governments.

Adapso itself must intensify its own efforts, particularly in the area of privacy and security regulation, he admitted.

He further urged the formation of an international policymaking body composed of DP organizations for the purpose of creating industry stands on critical issues.

"These stands will be communicated to already established international forums created to deal with data-processing related matters, such as the Consultative Committee on International Telephone and Telegraph [CCITT], which develops international telecommunications recommendations, and the OECD, where a Draft Treaty on Privacy and Security will be written," he said.

The issues on electronic funds transfer, privacy and security, tele- and data communications and postal regulations all involve the DP industry as it relates to Federal agencies in Washington and to innumerable state and local agencies, he noted.

Those dealing with myriad governmental bodies should help the U.S. DP industry meet the challenges of international relationships, he said.

Developmental Differences

Dreyer emphasized, however, the difference between the development of communications sevices here and abroad, where the communications function is a government-run monopoly or quasimonopoly.

The U.S. DP industry works under a system of checks and balances, among them user input, which help telecommunications develop according to user needs, he said. In addition, the industry always has recourse in the Federal Communications Commission and can switch to competing carriers to fight.

"In Europe, however, the telecommunications industry operates quite differently. Due to its governmental status — and to the comparative silence of European user groups — European communication services have developed in a void.

"The results...are not in the best interests of the data processing industry. Yet such services, such as Transpac, can be imposed on a nation regardless of how badly they serve our industry or any other.

"After they are imposed, it is too late to voice our dismay," Dreyer observed.

He reemphasized the need for user input, particularly in the case of bodies such as CCITT, to counteract the influence of common carriers, which is extremely strong. This is particularly true in the case of the CCITT, where the only voting members are governments that, in many countries, control telecommunications.

Of all the countries represented on CCITT, only the U.S. delegation has users among its members.

"If we had an International Data Processing Industry Council as the focal point of our industry to establish international policy on forthcoming proposals, we could persuade our governments before they go to the CCITT or other groups which impact our business," he said.

SBS Faces Legal Hurdles: Edelson

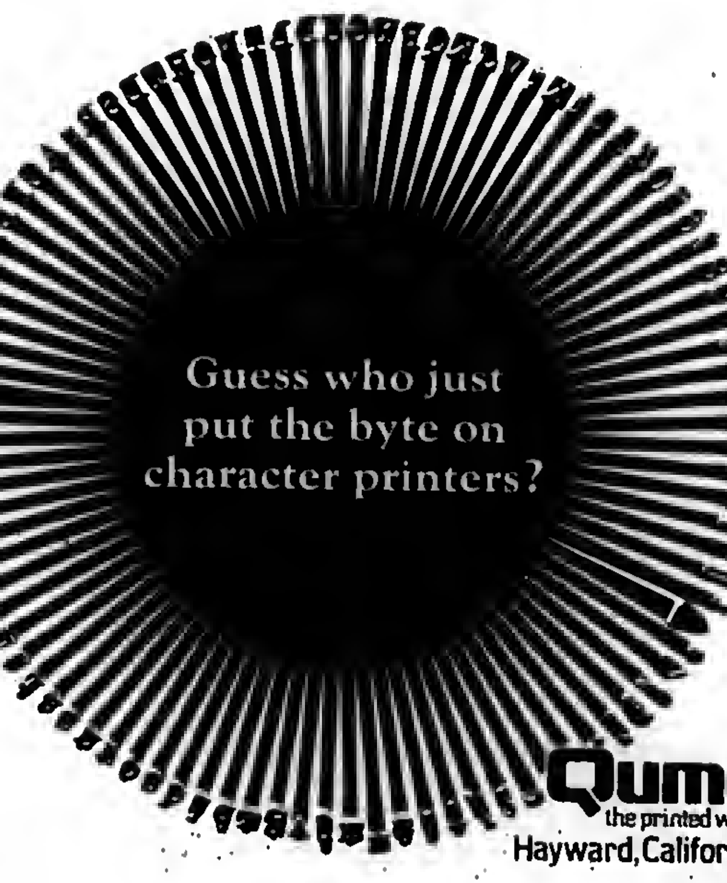
(Continued from Page 33)

pendently, it is quite conceivable IBM will get what it really may have wanted in the first place — a 100%-owned domestic satellite subsidiary," he speculated.

Edelson commented that Justice's rational for investigating SBS is "weak," since Comsat's entry would do little to ameliorate the competitive situation.

Total revenues for domestic satellite companies were only about $50 million last year, compared with total telecommunications common carrier revenues of about $35 billion, he noted. "The real competition for AT&T is IBM," he stated.

Edelson concluded by suggesting that ironically, IBM may benefit from the Justice investigation since the two most probable outcomes are that SBS will be approved or that IBM will have to enter the satellite business on its own, perhaps with additional restrictions.



Contracts

Computer Sciences Corp. has received a $40 million contract from the National Aeronautics and Space Administration for communications and instrumentation support services at Kenedy Space Center, Fla.

Grumman Data Systems Corp. has been awarded a $32.5 million contract to upgrade the U.S. Navy's Pacific Missile Test Center's computer facility at Point Mugu, Calif.

The Marine Systems Division of Rockwell International's Autonetics Group has been awarded a contract by the Naval Sea Systems Command for development of improved sonar processing equipment for the Navy's Poseidon submarine fleet.

Recognition Equipment, Inc. has received a $6.7 million contract for optical character recognition wand readers from NCR Corp.

Brandon Applied Systems, Inc. has received contracts totaling $3.1 million from United Airlines, Inc., FMC Corp. of Philadelphia and The Kendall Co. of Boston.

Harris Corp.'s Data Communications Division has received a $4 million contract from the U.S. General Services Administration for the lease or purchase of remote batch terminal systems by various federal agencies.

Computer Sciences Corp. has recieved a $3.2 million contract from the Federal Aviation Administration for an automated system to help the agency reduce aircraft delays and conserve fuel.

Kennedy Co. has received an OEM contract from Contraves AG of Zurich, Switzerland, for Kennedy's Model 9000 tape transports to be used in Contraves' numerically controlled machine tools.

Electronic Memories and Magnetics Corp. Severe Environment Products Division has been awarded a contract by Lear Siegler, Inc. to furnish memories for use in Lear's ARN 101 navigational computer systems in F4 aircraft.

Hendrix Electronics, Inc. has been awarded a contract by the *Chicago Tribune* to design and install a comprehensive electronic prepublishing system.

Lockheed Electronics Co., Inc. has received a contract from the U.S. Postal Service to install its Energy Management System in the Bulk Mail Facility in Jersey City, N.J.

The Pertec Division of Pertec Computer Corp. has been awarded a contract by Norsk Data A/S of Oslo, Norway, to provide digital magnetic tape transports and tape formatters.

Kits Available on Credit

Heath Sees Future Revenues From DP

By Esther Surden
Of the CW Staff

BENTON HARBOR, Mich. — Heath Co., maker of those do-it-yourself kits for hobbyists, stuck more than just a toe into the personal computer marketplace with its introduction of two computer kit products complete with peripherals (see Page L).

The firm, whch boasted $90 million in sales for 1976 and expects that "in the near future over 20% of company revenues will be derived from computers," has joined forces with Digital Equipment Corp. for one of its products, a personal computer based on the LSI-11, and has designed a less expensive system around Intel Corp.'s 8080A, according to Bill Johnson, vice-president of marketing.

Heath made a stab at the computer hobbyist market before, Johnson recalled. In 1957, it introduced an analog system that cost almost $1,000, but it quickly found out "there was not such a ready market" for the product and adopted a wait-and-see attitude, he said.

Now, the advent of LSI technology combined with lower costs have made home computing possible, he said.

Systems Approach

"We decided to take a systems approach" and design the products with peripherals so the buyer would not have to go from store to store to find what was needed to complete the system, Johnson said. "Tbis was costly to us because we passed up some substantial sales ~~dollars"~~ while in the development stage.

Hopefully, however, the approach will be profitable in the long run because Heath had a chance to "observe the competition" and "time to do research," he added.

The two systems were designed for a beginner hobbyist and a sophisticated user and had to be able to satisfy the needs of both the hardware-oriented person who likes to know how to put things together and the software and programming types who like a system for what they can do with it, he noted.

They will be available on a revolving charge credit plan Heath offers to its customers. This is believed to be the first time an individual can obtain a computer on such a plan and Heath thinks that the availability of credit will increase the number of people who can comfortably afford the systems.

In-House Software

The firm has developed an in-house software capability, according to Lou Frenzel, product manager. The smaller of the two products, which is basically a Heath-designed system, was built with the cooperation of the hardware and software people and thus incorporates user features not often found in standard barebones types of systems, he said.

The result of the software effort was dubbed "Benton Harbor Basic" after the firm's headquarters.

A large part of selling to the hobby marketplace is producing easy-to-follow, readable manuals and teaching people how to use the product once it's put together, Frenzel stated.

Heath is now in the process of producing teach-yourself-software manuals for this purpose, an area in which the firm feels it excels. The construction manuals are already completed and ready for distribution, having been tested by nontechnical types and revised.

The company chose its suppliers of CPUs based on what it felt were user needs, he continued. It felt sophisticated hobbyists needed a high-performance 16-bit CPU and evaluated several before choosing the DEC LSI-11.

The contract with DEC includes a licensing arrangement providing use of Assembly and higher level programming languages such as PAL-11, ED-11, Focal and Basic. Heath users will be eligible for membership in Decus, the DEC users group, a company spokesman said, giving them access to applications developed by other users for the LSI-11.

Heath thinks the partnership with DEC will be fruitful since DEC doesn't "typically address itself to individuals," while the kit maker does, Frenzel continued.

The Intel unit was chosen because it was low-cost, had a "proven design, works well and has a tremendous software base," he added.

Heath has added an intelligent front panel, heavy-duty power supply, CRT and paper-tape reader kit of its own design to the value of that CPU to come up with a full system, he said.

Wescon '77 Set as Biggest Yet

SAN FRANCISCO — Four hundred exhibitors in 680 booths will be on hand here Sept. 19-21 to make this year's Western Electronic Show and Convention (Wescon) the largest in its 26-year history.

In addition to the exhibits, 32 professional program sessions have been scheduled as well as two special sessions entitled "Engineering Careers and the Problems after 40" and "Your Job Interview: The Million-Dollar Decision."

Session topics will range from new advances in peripheral circuits — with papers on the role of peripherals in microcomputer systems and media encryption using bit-slice devices — to satellite systems in the 1980s, with papers addressing the Intelsat V system design, the Tracking and Data Relay Satellite System and Seasat-A, a user-oriented ocean monitoring satellite system.

Other sessions will cover advances in bipolar LSI logic, analog interfaces in microprocessor systems, single-chip microcomputers and new-generation semiconductor memory devices.

The transition to distributed processing, switching power supplies and applications of time-domain measurement systems will also be addressed.

Show hours are 9:30 a.m. to 6 p.m. Monday and Wednesday and 9:30 a.m. to 9 p.m. on Tuesday at Brooks Hall and the adjacent San Francisco Civic Auditorium.

All sessions wil be held in the continental Ballroom Complex at the San Francisco Hilton Hotel. A free shuttle bus will operate between the hotel and the exhibits.

Further Information on Wescon is available from Ted Shields Public Relations, 493 S.Robertson Blvd., Beverly Hills, Calif. 90211.

HIS Says Orders for Level 6 on Target

By Molly Upton
Of the CW Staff

DALLAS — Orders for Honeywell Information Systems, Inc.'s Level 6 line of minicomputers are as planned and are growing nicely with the firm's ability to produce them, according to Jim Pompa, vice-president and general manager of HIS' Small and Medium Information Systems Division.

U.S. shipments of Level 6s are about evenly split between OEMs and end users, Pompa said.

Since the beginning of the year, HIS has signed a major new customer a week, he indicated, adding these are customers who have a potential for 100 systems.

The Level 6 is one of HIS' cornerstones in its thrust toward distributed processing. One of the key markets for the mini is the current HIS end user. A large Level 66 user might buy 30 to 50 minis for distributed processing, remote job entry and data collection, Pompa said.

"Everyone's out competing, but it's logical for our own users to buy the Level 6 because of the research and development and compatible software," he added.

"As more distributed processing appears, there will be more software on the 6 that is also compatible with the other HIS systems. This presents a better value to users of large systems" than other makers' minis, he continued.

The Level 6 features a high level of configurability because each logical function is on a separate board, Pompa observed, noting users can buy what they need.

HIS is also focusing on its terminal line as it relates to distributed processing. "Minis and terminals go hand-in-hand in distributed processing," Pompa said.

HIS is making all major investment in terminals and will offer a totally compatible line of terminals with software as appropriate to function within HIS' distributed processing," he said.

Executive Corner

- Carl A. Froebel has been promoted to vice-president of portfolio and personal trust services and Robert A. Stafford to vice-president of banking and thrift services for the Financial Data Services Division of Automatic Data Processing, Inc.
- LeRoy C. Ostrander has been elected vice-president for marketing and sales at Epicom, Inc.
- Gary M. Roth has been named vice-president of sales for Anacomp, Inc.'s Kalvar marketing division.
- Stanley A. Brooks has been appointed vice-president of marketing for Information Retrieval Systems Corp.
- Richard A. Strain has been named vice-president and center manager of National Sharedata Corp.
- Josepb G. Scartaccini has been elected vice-president of marketing for Tel-Tex, Inc.
- Michael Novak has been promoted to executive vice-president of Ross Systems, Inc.
- William W. Neal, Howard B. Eskin and Thomas McInerney have been appointed corporate vice-presidents of Automatic Data Processing, Inc.

At our prices, why wait?

Miscoe EIA cable

Miscoe Manufacturing Limited stocks lengths of EIA cable to interface nearly any type of computer peripheral. Eleven standard lengths up to 50 feet with three connector combinations are in stock. If you require an unusual plug, cable type or odd length we can still surprise you with our price and delivery. Why spend more, Why wait? Ask now for our price list, or, better yet, try us on a small order and watch our speed. No minimums, whether you order one cable or a hundred, you'll receive the same prompt attention.

Role of the Distributor — Part 2

Support Programs Called Vital to Organization's Success

By Bruce Milne
Special to Computerworld

Today, a minicomputer manufacturer must supply more than hardware, operating systems and discounts in order to ensure a successful distributor organization.

Only a few years ago, selling small business systems via distributors or OEMs was unique. Today there are over 40 companies marketing in this manner and a potential of over 75 more domestic and international entrants who have the technology to be systems suppliers.

Therefore, no matter what the business philosophy of a mini manufacturer regarding distributor support programs, today's competitive environment dictates a comprehensive set of support programs to attract and keep the quality distributor.

The dilemma for the manufacturer is that the primary purpose of distributors is to gain market coverage without heavy investment in a direct sales organization and extensive software development, yet such support programs cost money.

Because of this, the critical task for management is to prioritize these programs to best utilize their limited financial resources.

In order to do this effectively, they have to better understand the needs of their distributors.

In the early '70s, a small wholesale business wanting to solve some of its billing, accounting and information problems might have received proposals ranging from an NCR 400 and Buroughs "L" series to a Basic/Four system or low-end IBM System 3.

There was a dramatic difference in both the approach to the problem and in the technology of the hardware. Selling the differences and benefits of one system over another was an easier task than it is today.

In today's marketing environment, a mini system distributor may have few hardware differences over other minis and systems from the major manufacturers such as IBM and Burroughs.

These "majors," with their huge customer bases and large, experienced sales forces, still constitute the most important competition for distributors. Mini distributors and direct sales people for other mini manufacturers are a distant second and third in importance.

Given this basic understanding of the competitive environment, it is not surprising to find that most distributors feel they lose sales because of lack of "image" and customer concern about their longevity.

Because of the increasing importance of software in the systems sales and the lack of hardware differentiation, most distributors believe they must develop more superior applications software and provide financing service to offset the lack of price differences in the market place.

Areas of Focus

Because of these perceived needs, most distributors would like to see the manufacturers focus on a few key areas:

- Improved communication.
- Cooperative advertising.
- Marketing aids.
- Distributor financing.
- Application software support.

All of these relate to improving the distributor's image and presence in the market place. Communications cover a broad range of distributor transactions including getting concise delivery information, prices, new product information and technical help.

This is the last of a two-part series dealing with some of the findings of a recent industrywide survey on the role of small business computer distributors.

The research was conducted by Bruce Milne and Barry Klett at the Harvard Business School and was supported by Basic Four, Cincinnati-Milacron, Digital Equipment Corp., Lockheed, Olivetti, Qantel and Sycor.

The study included survey responses from 243 distributors and OEMs, interviews with executives of 12 manufacturers that are active in selling via distributors and related research. Because of the similarity in legal relationship, function and problems, distributors, dealers and OEMs were considered together.

Part I examined the significance of recruiting distributors as emphasized by manufacturers.

In the sales cycle, not being able to get that information on a timely basis can severely hurt the distributor's chances for an order.

Much of the communication problems can be helped by a more focused approach to the management of the distributor. For example, credit, marketing software and service questions may have to be answered by several divisions at the home office or field office, frustrating the distributor. A regional management system that can be the focal point for nearly all of the problems is a much better system.

In advertising, the distributors believe that the "primary" demand for small business computers is being created by the entry and massive advertising campaigns of the major DP manufacturers. They feel the mini makers can better serve the distributors by spending money to help them improve their image with some national advertising and more mailer campaigns, local radio, TV, newspaper and industry specific campaigns.

Marketing aids refer to demonstration programs, video-tape materials, brochures, shows and the like. Again, the distributor needs to project a professional image with his approach and the media he uses.

The financing need can best be met in the form of delayed billing. This is one of the major problem areas for distributors because they are generally undercapitalized.

A good month with two or three systems sales can literally put a distributor out of business if he is not receiving full customer payment for 90- to 120 days, yet is required to pay his supplier in 30 days.

This means a distributor may have to come up with an extra $100,000 or more in short-term funds as well as meet the increased personnel need resulting from the installation demands.

Support Programs Critical

Manufacturer software support programs are critical to the profitability of the distributor. Considering that the average distributor spends 40% to 50% of his total investment in software development and his net profits are only 6% to 10%, a reduction in the amount spent by him in software developmentwould mean less expense per system sale, more dollars freed for working capital and greater profit and sales.

A comparison of distributor organizations shows the percentage of distributor investment dedicated to software development is nearly half for groups with manufacturer software support vs. unsupported groups. Better results are also shown in sales and profits for the well-supported distributors.

This indicates that the manufacturer should supply some basic modules such as accounts received, accounts payable, payroll and invoicing to eliminate the redundancy in field development work among the distributors for these bread-and-butter applications.

The Questioning Distributor

A prospective distributor, or one considering changing its equipment sourcing, should naturally consider the reputation, product offering, hardware/software training and equipment service of any manufacturer. However, it should also look closely at the dedication and types of support programs the manufacturer has to insure the distributor's sales success and profitability.

Seven groups of questions a distributor might ask are:

(1) Are the communications links with the manufacturer clear and sufficient? Can I get the information I need on a timely basis?

(2) Are there basic software modules available and an applications interchange system? Are new systems released with basic application and demonstration modules so I don't have to develop from scratch programs and routines to use any new language or operating system?

(3) Is there a national advertising program and budget dedicated to helping me on the local cooperative advertising level?

(4) What types of financing programs are available? Leasing? Delayed billing? What happens if I cannot meet the short-term financial needs? Will the manufacturer help? If the manufacturer is very small, does he have the funds to provide financing programs?

(5) Is there a professional, competitive set of marketing aids available to me including demonstration materials, brochures, customer training aids, etc.?

(6) Are there training programs for management and sales personnel? Are regular seminars held and is there a distributor association supported by the manufacturer?

(7) Does the manufacturer promote industry penetration or is he trying to "shotgun" the general market? Is he stressing product superiority which could be short lived?

Univac Starts Market Program

BLUE BELL, Pa. — Univac is actively pursuing the manufacturing industries' DP market by instituting a nationwide marketing program supported by expenditures of more than $20 million this year.

"More than 27% of the computers now installed in the U.S. are operating in manufacturing environments," according to C.R. Williams, vice-president and general manager of the Sperry Univac Americas Domestic operations.

"This large base is currently valued at more than $10.5 billion and is expected to grow to $16.5 billion by 1981," Williams said.

"Our new marketing program has been organized to capture a substantial share of the $9 billion in new and replacement computers, which will be delivered to the manufacturing industries in the next five years," he said.

To date, Univac has received orders from more than 140 manufacturing companies for the Univac Industrial System (Unis) a flexible material requirements planning and production scheduling system.

DP Firms Found Among Leaders in R&D Spending

By Toni Wiseman
Of the CW Staff

NEW YORK — Data General Corp., which spent 10.7% of its 1976 revenue on corporate research and development, took second place out of 600 firms in the category of percentage of revenue spent on R&D, according to results of a *Business Week* survey.

Hewlett-Packard Co. placed fifth, spending 9.7% of sales, and American Microsystems sixth, spending 9.6%, according to *Business Week* figures.

The survey, compiled with data from the Securities & Exchange Commission (SEC), showed that the 600 firms surveyed increased their R&D expenditures by 11.6% in 1976, compared with a 6.5% increase in 1975, the magazine reported.

Under new SEC rules, companies must report as R&D expenses all costs associated with the search for, and discovery of, new knowledge that may be useful in developing new products, services, processes or techniques, or that might significantly improve existing products, *Business Week* noted.

On the other hand, costs associated with routine product improvement, market research, test marketing, quality control and engineering follow-through in production cannot be expensed as R&D under SEC rules.

In an across-the-board comparison of industries, the office equipment segment, which includes computers, was the top spender in 1976, with aggregate expenditures of 5.4% of sales.

In spending per employee, office equipment was second, with an average of $2,347 per employee, *Business Week* said. Only the drug industry spent more.

For computer firms, IBM's R&D budget was far and away the largest, at $1.01 billion, but California Computer Products, Co. spent the most per employee — $3,592.

DG's expenditures were the largest percentage of sales, Mohawk Data Sciences' were the larges percentage of profits (210.6%) and Electronic Memories and Magnetics (EMM) had the largest percentage change from 1975 (102.3%).

Burroughs Corp., with 1976 sales of $1.9 billion, spent $107.9 million, or 5.8% of revenues, on R&D, a 6.9% increase over 1975, the survey showed. These expenses averaged out to $2,164 per employee and 58.1% of profits.

Calcomp, with $122 million in revenue, spent only $10.1 million, or 8.3% of sales, on R&D, a 7.1% decrease over the previous year. Nevertheless, R&D expenses for the firm averaged out to $3,592 per employee.

Control Data Corp. spent $58.9 million, or 4.4% of its $1.3 billion sales. This represents 124% of its profits or $1,416 per employee, *Business Week* said.

Further Findings

DG spent 10.5% of its sales and 90.8% of profits — a 47.9% increase over 1975, which averaged out to $2,978 per employee.

Digital Equipment Corp. spent 7.9% of sales and 79.5% of profits, a 20.3% increase. DEC's R&D spending averaged $2,336 per employee, according to *Business Week* figures.

With revenues of $2.5 billion, Honeywell expensed $125.6 million to R&D, which amounts to 5% of sales or 119.3% of profits, but only $1,774 per employee, the magazine said.

While IBM had by far the largest R&D budget, $1.02 billion, that figure represented only 6.2% of sales and 42.2% of profits and averaged $3,466 per employee, the survey found.

EMM spent 102.3% more in 1976 than in 1975. Its $4.7 million R&D expenses represented 5.2% of sales and 61.4% of profits or $1,144 per employee.

NCR Corp. expensed $94.3 million to R&D last year, a 10.9% hike over 1975. This represented 4.1% of sales, 104.7% of profits and $1,407 per employee, *Business Week* noted.

While Storage Technology Corp. reported $7.8 million in R&D expenses or $3,098 per employee, Telex spent only $2.1 million or $910 per employee. The companies' budgets were up 8.2% and 8.9% respectively over 1975.

Financial News

Nickels & Dimes

Comshare has arranged two financing arrangements. A term loan of $1.2 million has been arranged for the purchase of Xerox/-Honeywell Sigma 9 CPUs and Ampex memory, and a $2.2 million term loan has been arranged for refinancing to improve the terms of notes payable on existing equipment.

$$$

Hazeltine has entered into a new $6 million unsecured credit agreement with the Chase Manhattan Bank and the Long Island Trust Co. Hazeltine borrowed $3 million which, with additional company funds, was applied to the payment of $3.8 million to the Federal Deposit Insurance Corp. in full prepayment of a revolving loan and $1 million to Walter E. Heller & Co. in full prepayment of a term loan.

General Computer Systems and **North American Corp.** have acquired 45 data entry equipment leases for GCS 2100 equipment that had been foreclosed upon by the Bank of America

Making the most of terminal intelligence.

A special report on *Data Communications Terminals* in the July 25th *Computerworld.*

Intelligent terminals are changing the way we communicate with computers — making them easier to use, more accessible and responsive to users' needs. And *Computerworld's* next special report will focus on conversational and editing terminals, as well as remote batch terminals, CRTs and teleprinters.

Edited by Ron Frank, this report will examine ways to maximize the benefits of terminal networks while minimizing the costs. Using applications stories and tutorials, we'll cover a wide range of topics:

- Ways to determine how much intelligence (i.e. processing logic and memory) you need when changing from dedicated to multiapplication terminals.
- How some users achieved greater efficiency with their dedicated, "dumb" terminals.
- Ways to adapt your existing network to the emerging line protocols.
- Ways to configure terminal networks for multiple applications.
- Managing terminal networks for corporate efficiency — matching requirements with resources and equipment.
- A review of guidelines to use when evaluating terminals.
- The effect distributed data processing is having on terminal selection and use.

In all, this report could help you cut costs in your organization while establishing a firm base for future expansion. If you have anything to do with data communications efficiency, whether as a DP Manager, Communications Specialist, or Executive with an eye for efficiency measures, you shouldn't miss the special report in the July 25th *Computerworld.*

If you're in the business of manufacturing and marketing data communications terminals, you should put your ad here. You'll reach a rapidly expanding market. For example, International Data Corporation expects to see a tremendous increase over the next three years in the installed value of conversational and editing terminals used exclusively for data communications purposes: from $3.2 billion in 1977 to $5.8 billion in 1980. Your *Computerworld* salesman can give you complete details — but don't miss the July 8th ad closing date. Call Terry Williams at (617) 965-5800 to reserve space for your ad.

Based on 8080, LSI-11

Heath Introduces Kits for Personal DP

BENTON HARBOR, Mich. — The H8 and H11 are personal computers in kit form available from the Heath Co. Although primarily designed for home use, they will probably have some degree of use in very small businesses, the vendor said.

The systems are based on the 8-bit Intel Corp. 8080A micro and the Digital Equipment Corp. LSI-11 mini, according to the firm.

The 8-bit H8 features an intelligent front panel with octal data entry and display and a resident monitor wth built-in bootstrap for one-button program loading or storing, Heath said. The system can accommodate up to 65K of addressable memory.

Microcosm

The H8 is huilt around a 10-slot hus and features a built-in power supply. Available peripherals include a Heath CRT kit, paper-tape reader/punch, serial and parallel interfaces, a DEC hardcopy terminal and a cassette player/recorder, a spokesman noted.

The H11 features an LSI-11 with 4K of memory expandable to 20K, built-in backplane, power supply and I/O interface accessories. The H11 comes with a software package from DEC that includes an editor, PAL-11 assembler, linker, on-line debugging package, I/O executive, Basic and Focal.

The 12-in. CRT terminal available with the H11 has a 67-key Ascii keyboard with a 12-line, 80-character format. The unit can he formatted in four columns of 12 lines, 20 characters wide, and has a cursor control.

Users can format on the screen and when satisfied batch into their system, the spokesman said.

Standard Interfaces

Standard serial interfaces include EIA, 20mA loop and TTL I/O. The unit transmits at 110- to 9,600 bit/sec.

A Heath-designed paper tape reader/punch unit will function with any digital computer, the firm said. It uses standard 1-in. wideroll or fanfold 8-level paper tape.

The reader section reads tape at 50 char./sec while the punch operates at 10 char./sec. Punch and reader circuits are completely independent, the firm noted.

The systems and peripherals will he available through Heath retail stores and mail order catalogs, the firm said.

The H8 costs $375 for a "fully wired and tested CPU," assembly and operations documentation. All systems software is included in audio cassette form.

Memory and I/O interface accessories include an 8K board with 4K of static random access memory (RAM) for $140, a 4K expansion chip set at $95, a serial I/O interface board with 1,200 bit/sec audio cassette interface for $110 and a three-port parallel interface which costs $150.

The H11 CPU costs $1,295. A 4K by 16-bit RAM board costs $275, a flexible serial interface costs $95 and a parallel interface costs $95.

The CRT costs $530 in kit form while the paper tape reader/punch unit costs $350.

The firm is also distributing DEC's LA36 printing terminal in assembled form for an undetermined price.

Heath can he reached through Department 350-26, Benton Harbor, Mich. 49022.

Mits Has Interface For Audio Cassette

ALBUQUERQUE, N.M. — Mits, Inc. has introduced an audio cassette interface for its 680b microcomputer that enables storage and retrieval of data.

The 680b-KACR circuitry is based on the Kansas City Standard, the firm said, and costs $250 assembled.

The price includes 8K of Basic on cassette if the customer has the 680 mainframe and the 680 BSM 16K memory board, a spokeswoman said.

Otherwise, the interface costs $225 and the software costs $200 from the firm at 2450 Alamo S.E., Albuquerque, N.M. 87106.

NOVA MAINTENANCE

(Who Needs Those Hardware Headaches?)

Fortunately the NOVA Users in the Washington, D.C. metropolitan area have a second choice to the slow response to service offered by the manufacturer.

That Choice Is: Computer Systems Support Corp.

Responsive service done by qualified field engineers on a per call or on-call basis, at a rate much less than the competition.

Also offered is repair on a board level basis in our office for the following machines:

SUPER NOVA
1200
800
NOVA II
NOVA III

Anyone desiring fast turn-around on repair call or write:

Computer Systems Support Corporation
121 Congressional Lane, Suite 412
Rockville, Maryland 20852
(301) 424-7870

CORRECTED ADVERTISEMENT
SPECIAL LETTING OF NOVEMBER 9, 1977

Prospective bidders are hereby advised that the following Advertisement has been corrected to state that *Prequalification of Sub-Contractors will be required for this project.* (See * Net Classification required for bidding the project).

Bids will be received at a Special Letting sheduled for November 9, 1977, at 10:30 a.m. EST in Parlors C&O, Civic Center, Lansing, Michigan, for the following project:

PROJECT	I U 82023	Job No. 04118 A	Fed No. I UF 76(1)
	I 82023	04121 A	I 94-5(109)216
	U 82111	09094 A	U 86-1(210)
	I 82195	04133 A	I 75-1(164)44
	M 82023	11644 A	

INSTALLATION OF A COMPUTER-BASED FREEWAY SURVEILLANCE AND CONTROL SYSTEM FOR 32.5 MILES OF FREEWAYS IN THE CITY OF DETROIT, WAYNE COUNTY, MICHIGAN. THE PROJECT INCLUDES, BUT IS NOT NECESSARILY LIMITED TO, THE FOLLOWING ELEMENTS:

Provide and Install Data Acquisition and Control System, Including Display Panel, Operator's Station, and Associated Equipment.

Design, provide, and Install Control Room modifications to accommodate the Control Room equipment, including fire protection, power, climate control, raised floor, etc.

Design the entire field equipment layout, and install traffic detectors on 32.5 miles of Freeway and ramps, and communications equipment to the Control Center.

Install Ramp Metering equipment on six ramps, and communications equipment to the Control Center.

Install closed circuit television cameras and associated equipment at four locations, communications equipment to the control center, and receivers at the control center.

Provide a performance Assurance Service Program for the System for 10 months after acceptance.

Install a Motorist-Aid Call Box System on 13.9 miles of freeway.

This project is a Federal Aid Project under the provisions of the Federal Aid Highway Act of 1968. As defined under Section 113 of Title 23 U.S. Code as amended. The Davis-Bacon Act is applicable and requires the Secretary of Labor to determine the minimum wage rates to be paid by the contractor and subcontractors, which rates will be given in detail in the proposal.

ATTENTION IS CALLED TO SECTION VII OF THE REQUIRED PROVISIONS REGARDING SUBCONTRACTING.

This project is subject to the BID CONDITIONS-AFFIRMATIVE ACTION REQUIREMENTS-EQUAL EMPLOYMENT OPPORTUNITY-DETROIT PLAN. (See Proposal)

Net Classification required for this project is:
1084 N-9* (Computer Traffic Control)
Prequalification of Sub-Contractor will be required for this project.

Bid Deposit required is $50,000.00

Completion data is 660 Calendar Days.

Plans may be examined at the Michigan Department of State Highways and Transportation Freeway Operations Unit, 2211 E. Jefferson, Suite 100, Detroit, Michigan

* Prequalification Forms are being furnished for your use in becoming prequalified with the Michigan Department of State Highways and Transportion. If interested in bidding on this Computer-Based Freeway Surveillance and Control System project, you must file all the necessary documents required for prequalification on or before (preferably before) September 20, 1977. In addition, form 1300, Statement of Current Contracts and Subcontracts, as of September 30, 1977, must be submitted by October 12, 1977.

The Michigan Department of State Highways and Transportation hereby notifies all bidders that it will affirmatively insure that in any contract entered into pursuant to this advertisement, minority business enterprises will be afforded full opportunity to submit bids in response to this invitation and will not be discriminated against on the grounds of race, color, or national origin in consideration for an award.

TI Adds Micro Developer

HOUSTON — Texas Instruments, Inc.'s Microprocessor Development System for its TMS 9900 series of microprocessors is based on the FS990 software development system.

The system includes the TMS 9900 emulator/advanced Microprocessor Programming Language (Ampl) package and the FS990 software development system. The disk-based FS990 includes a Model 990/4 microcomputer with 24K words of 16-bit memory, dual floppy disk drives and a Model 913 CRT.

Options include the Model 990 programmable read-only memory (Prom) programmer, Trace Data Module Kit, Model 810 printer and Fortran software license.

The system features 9900 microprocessor emulation, logic state trace, Prom/read-only memory (ROM) implementation, Fortran and Ampl, an interactive control language.

The unit provides software development in both Fortran and Assembly language: integrated software/hardware emulation for debug and test; and firmware implementation, the firm said.

The emulation feature provides support during the entire design phase, from design evaluation through emulation and testing and evaluation, TI said.

The system can also generate stand-alone Fortran routines which can be compiled to 990 computer object code for execution on a 9900 Target system, according to the firm.

The basic system price is $13,600 from TI's Digital Systems Division, M/S 784, P.O. Box 1444, Houston, Texas 77001.

Sentry Developed for LSI Testing

SAN JOSE, Calif. — Fairchild's Sentry V is a cost-effective version of the firm's Sentry VII testing system for LSI production testing, the firm indicated.

The multitasking Sentry V handles microprocessors, peripheral chips, bit slices, and digital hybrids, among other components.

The unit is source program-compatible with the Sentry II, VII, 600 and 610, Fairchild said, and is hardware-compatible with the Sentry VII.

The hardware is a 24-bit CPU with up to 196K words of semi memory.

Prices for a Sentry V system start at $169,500 for a complete 30-in. system from Fairchild's Instrumentation and Systems Group, 1725 Technology Drive, San Jose, Calif. 95110.

TEI Producing Unit As Micro Foundation

HOUSTON — TEI, Inc. is producing a foundation unit for a microcomputer system which includes cabinet, power supply and a 12-slot S-100 bus system with all edge connectors inserted, soldered and checked out.

The unit, dubbed The Mainframe, is compatihle with all S-100 bus-type PC hoards, according to the firm.

A fan is also included.

The unit costs $445 assembled and $395 in kit form from CMC Marketing Corp., 7231 Fondren Rd., Houston, Texas 77036.

F&S Sees $3.5 Billion in Law Office Automation

NEW YORK — Law office automation is a virgin market with a sales potential exceeding $3.5 billion over the next 10 years, even assuming only 50% of the law offices will be substantially automated, according to a recent report by Frost & Sullivan, Inc. (F&S), a market research firm here.

This $3.5 billion in revenues represents about $1 billion for service hureau accounting services, $500 million for small business computer systems and $2 billion for text-editing word-processing systems, F&S said.

In addition, another $2 billion will come from computerized litigation and library research that pertains to the legal profession, the researchers noted.

"We expect that almost all law offices will have some form of test-editing equipment within the next 10 years, with the larger law firms employing shared-logic multiterminal systems and the small- to medium-size law firms having a mixture of the low-cost typewriter with internal memory and the higher cost video terminal minicomputer system," F&S stated.

The report projected text-editing word-processing will yield the highest sales, with annual sales of more than $200 million from 1978.

It added, however, that "the type of text-editing systems will drastically change from a typewriter to video terminal microcomputer system with diskette or disk storage and a line printer. Variations of the text-editing system will include single or multiple terminal systems."

In-House Systems

By the mid-1980s, about 40,000 law firms will be using DP services and equipment, with most firms opting for their own in-house small business systems, F&S predicted.

Smaller firms will turn to sevice bureaus while medium to large firms, with eight lawyers or more, will be more apt to acquire an in-house system.

Such systems will range from a $15,000 single terminal diskette system with time-accounting software to a $75,000 multiterminal disk cartridge system with accounting and docket control software, it indicated.

Limited Use?

"The mixture of data processing and word processing, while appearing economical, may see limited use due to the need to perform both activities during the day.

"The larger multiple terminal system could perform both functions, but the law firm will have a high initial purchase cost," the report said.

F&S further noted that computerized legal research, while not specifically a law automation product, will gain considerable popularity with the large number of law firms involved in litigation. It cautioned, however, that only a small number of firms will have sufficient resources to develop such research systems.

"Like other professional service industries, the law office has been bypassed as a market for data processing and sophisticated word-processing services. The competition has been mainly law-oriented service bureaus, independent software companies and some input from the larger data processing companies in a more general sense.

Open Market

"We feel that the market is still open and companies that can offer both service and equipment will be the most successful. That is, the company must possess capabilities to offer a solution to the entire office automation needs rather than just one segment.

"Since the law office requires a long, hard sell, only those that can offer both varied type products and have financial staying ability will last.

"A nationwide service bureau and small system distributor will have the best chance of success," F&S suggested.

COM Coming of Age

ROCHESTER, N.Y. — Even though computer output microfilm (COM) equipment has come of age, manufacturers must accept continuing challenges to their ability to provide product enhancements responsive to a changing marketplace, an industry executive said recently.

Computer output microfilmers have survived excessive speculation since their introduction in the late '60s that they would or would not achieve a major level of acceptance, according to Wilbur D. Robinson, Kodak business systems planning coordinator.

"Many feel — and actual COM placements since 1972 seem to support it — that COM's growing pains are subsiding; the product is coming of age," Robinson said.

He cited inflexibilities in hardware and marketing methods as major growth constraints that have been removed.

New Companies

Micro Peripherals, Inc. has been formed to manufacture and market peripheral products for the personal computing, small business systems and OEM markets.

Interactive Systems Corp. has been formed with Peter G. Weiner as president.

The firm is located at 1526 Cloverfield Blvd., Santa Monica, Calif.

NCE Computer Systems, Inc. has been recently formed. The company will handle international sales and service of minicomputers manufactured by International Computer Products, Inc., in Dallas.

Jim Capuzzo is president. The company is located at 1536 Brook Drive, Downers Grove, Ill. 60515.

Micropolis Corp. has been formed to specialize in the design and manufacture of data storage devices for home and industrial microcomputer markets.

Stuart Mabon is president. The company is located at 9017 Reseda Blvd., Northridge, Calif. 91324.

Comdisco, Inc. and **Forsythe/McArthur Associates, Inc.**, two third-party leasing companies, have entered into a partnership to form the Terminal Leasing Company.

The company is located at 919 North Michigan Ave., Chicago, Ill. 60611.

EMI Technology (Southeast Asia) Ltd. has been formed here to market a range of EMI's technological products, including the EMI-Scanner computerized medical X-ray system throughout Southeast Asia.

G.W. Philips has been appointed managing director of the company.

J.H. Morgan Co. has been formed to provide consulting services for problems having combined technical and management aspects in the areas of DP, communications and electronic systems.

James H. Morgan is president. The company is located at Post House Road, Morristown, N.J. 07960.

COMPUTERWORLD INDEX

SUBSCRIBE TO THE 1977 COMPUTERWORLD INDEX AND GET SIX MONTHS OF REFERENCE INFORMATION FREE.

The new Computerworld Index, published quarterly and cumulative, is an invaluable reference tool for organizations that have a need-to-know about what's going on in the computer world.

The first issue of the Index for example, covers the last six months of 1976, and it includes more than 4,000 entries by subject, author and name of any company mentioned. It breaks topics down into highly usable and convenient categories:

- There are entries by *product or service*, like *PRINTERS*, which has 37 entries in the six-month period covered; or *LEASING*, which has 10.
- There are entries by *industry*, like *INSURANCE*, under which there are 17 entries for various stories on the use of computers in the insurance industry.
- *Types of computer applications* is another way you can look something up in The Index. The category *INVENTORY SYSTEMS*, for example, has 21 entries.
- *Regulatory, security* and *social issues* are also indexed. There are 34 entries under *PRIVACY*, 10 under *PRIVACY ACT* and 9 under *PRIVACY PROTECTION COMMISSION*, for example.
- The Index also makes it easy to look into *legal aspects of computer use* with categories like *LITIGATION*, which has 24 entries in the last six months of 1976.
- Even *foreign countries* are indexed. The category *JAPAN*, for example, has 9 entries.
- ... and there are *others: KIT COMPUTERS* (the kind you build yourself) are the latest thing, and The Index shows 5 entries. *POINT-OF-SALE SYSTEMS* has 14 entries ... and there's much, much more.

Company Names, for example, are a very important part of The Index. Looking under IBM, we find *ten* categories:

- IBM GENERAL
- IBM LITIGATION
- IBM SOFTWARE
- IBM SYSTEM 3
- IBM SYSTEM 7
- IBM HARDWARE
- IBM PRICING
- IBM POLICY
- IBM SERIES 1
- IBM SYSTEM 32

Our special, no-risk offer:

Subscribe to one year of the Computerworld Index (4 quarterly issues, published three months after each quarter ends and cumulative) at the regular rate of $150; and we'll send you the Index for the last six months of 1976 FREE. In addition, we'll give you ten days to look over the 1976 Index AT NO OBLIGATION. Should you decide it's not what you need, just return it to us marked "cancel" and we'll cancel your subscription.

POSITION ANNOUNCEMENTS

MANUFACTURING SYSTEMS

PROGRAMMER/ ANALYST

Rapidly growing manufacturing firm, third in its field, is seeking an experienced Programmer/Analyst for IBM System 3, Model 12, RPG II. CCP definitely a plus. Previous experience with Manufacturing Systems a must.

This is an outstanding opportunity to participate in the present and future growth of a major Industrial Cleaning Equipment Firm. Due to rapid expansion, we have just moved to a larger location northwest of Chicago in Harwood Haights (4600 N - 7400 W).

We offer excellent career opportunities along with full company benefits. Salary commensurate with experience. Forward your letter or resume with salary history to:

Manager-Management Information Systems
Breuer Electric Mfg. Co.
7401 W. Lawrence Avenue
Chicago, IL 60656

MODLINE
modular online systems
the "Un-hardware" Company

MODULAR ONLINE SYSTEMS, COMPANY (MODLINE) is an organization of dedicated computer programming professionals successfully pursuing projects covering the entire spectrum of computer technology: micro-processors, mini-computers, communications processors, business systems, data base applications, and time sharing.

We are presently seeking experienced career oriented

BUSINESS ANALYST/ PROGRAMMERS

responsible for analysis, design and programming utilizing RPGII, COBOL, and BASIC Languages.

Our modern facilities are located in the heart of the beautiful Pacific Northwest. We offer an excellent working environment and employee benefits package.

Be a PROFESSIONAL in your chosen field. Join one of the fastest growing computer software corporations.

Please reply with resume including desired salary requirements to: MODLINE, 3836 N. Ballast, Portland, OR 97217.

Director of Computing Services

Dartmouth College

Directs administrative, technical and development/research activities of Kiewit Computation Center to provide quality computing services to all segments of the Dartmouth College community. Responsibilities include educational and administrative computer services, staffing, training, program and policy development, liaison with committees and user groups, and contacts with other institutions and organizations. Prior experience with a time-sharing computing system is essential, as well as administrative experience in managing a major academic cost center. Preference will be given to candidates who demonstrate a proven ability to relate to diverse user groups including students, faculty and administrative staff. Extensive experience in research and administration of computer-related activities with recent experience at a senior administrative level.

Submit resume by September 15, 1977 to Chairman, Search Committee, Director of Computing Services, 201 Wentworth, Dartmouth College, Hanover, New Hampshire 03755.

DARTMOUTH COLLEGE
An Equal Opportunity/Affirmative Action Employer

SOFTWARE SALES MANAGER

DTSS. Incorporated seeks a person to take charge of sales of the Dartmouth Time-Sharing System software. This chief salesperson will also supervise technical sales support personnel, be responsible for costs and revenues, and help formulate sales and pricing policies. Frequent travel should be expected. Candidates should have sales experience and be familiar with computing.

DTSS software, a time-sharing operating system originally developed by Dartmouth College, has been enhanced and refined by DTSS Incorporated. Its particular strengths are in ease-of-use, the economies of large numbers of simultaneously supported users, multiple languages, commonality of foreground/background modes, and highly-developed interfaces to telecommunications networks and interactive terminals. DTSS software runs on Honeywell Level 66 computer equipment and therefore Honeywell supports efforts to sell DTSS software.

DTSS Incorporated is a five-year-old, profitable, New Hampshire corporation owned by Dartmouth College. Current annual sales of nearly one million dollars are due to ten software license agreements with a prestigious list of Fortune-500 companies in the automotive, aerospace, chemical, and computer services businesses.

This opportunity is at our offices in Hanover, New Hampshire. This college community in the forested upper valley of the Connecticut river has fine outdoor recreational opportunities, but is is only a few hours' drive from Boston, Montreal, and New York. Compensation includes a base salary plus a strong incentive bonus for successful sales performance. Please send resume to Dr. Robert F. Hargraves, Jr., President, DTSS Incorporated, Box 799, Hanover, NH 03755.

The Tip of an Iceberg

There's much more to GTE Automatic Electric Laboratories' involvement in the digital hardware and software evolution in Telecommunications.

The #3EAX computer-controlled switching system, a portion of which is portraying our iceberg tip, features a digital PCM network and stored program control. It is one of a family of advanced systems spearheading our digital evolution in telecommunications. Our primary assignment is to research and develop the communications systems of the future. Sophisticated systems employing state-of-the-art techniques in digital hardware, and the development of complex software architecture, support systems and programming

GTE Automatic Electric is a major member of the GTE Family whose research and development expenditures ranked among the top 50 Research and Development spenders in U.S. industry in 1976.

We are embarking on a major expansion of our technical and laboratory staffs.

We're talking with skilled professionals. . not only those with telecommunications experience, but individuals with experience in virtually every segment of the computer, and computer related hardware/software industry, including marketing and manufacturing support. If you have hardware/software skills in any of these areas, talk with us about a growth future in a massive growth field. Application Software, Digital switching systems, logic design, diagnostics, Software/Hardware interface and testing, data base systems, real-time systems design, CAD/CAM, mainframe design, micro/mini systems and design, and related areas

For more information about your growth future in Telecommunications, talk with one of our representatives. TODAY. Call Toll-Free: (800) 323-1966 or if in Illinois or surrounding areas call Toll-Free (800) 942-0491.

OPERATIONS MANAGER LARGE COMPUTER CENTER

JOIN A COMPANY GROWING 40-50% PER YEAR

The Computer Services Division of American Management Systems, Inc., has an immediate need to fill the job of Operations Manager in its Arlington, Virginia Computer Center. The Center presently has a 370/165 and a 360/65 running under OS/HASP. Conversion to MVS is in progress. Customers access the AMS Center via RJE, WYLBUR and CICS, using local lines and the Telenet communications network.

The individual we seek must have the ability to coordinate effective use of all computer resources in a service environment, and direct the physical installation and integration of additional hardware.

Persons applying for this challenging position must satisfy the following requirements:

- Funcational knowledge of hardware to insure vendor performance and assist with planning.
- Experience as an operations manager in a large OS or VS environment with substantial teleprocessing.
- Experience in production scheduling and tape library management.
- Experience in development and enforcement of operational procedures.
- Demonstrated leadership qualities and personnel management experience.

In addition, the following qualifications are desirable:

- Experience in VS environment (either SVS or MVS)
- Ability to develop procedures for insuring TP network reliability
- Specific experience in setting up security procedures

Salary will be mid to upper 20's, depending upon experience. Excellent vacation, other fringe benefits.

This is a key position. Potential for profit sharing and stock options within two years.

Is Your Career Stifled?

Digital's Educational Marketing Group Offers Unprecedented Opportunity

Digital's Educational Marketing Group, located in Marlboro, Massachusetts is firmly committed to being the premier source of computer systems, equipment and services for the Educational market. To accomplish this, we are seeking professionals with proven expertise in both the computer business and academia. Our new product lines include advanced, highly sophisticated large computer systems, for any aspect of an educational instition's needs . . . from servicing business applications to serving as students' learning tools.

Our marketplace is international and our Group is just beginning to grow. This is a ground-floor opportunity to build and advance with a group setting the goals and standards for things to come in one of the most rapidly expanding areas of the computer industry.

Marketing Managers

We're currently seeking self-starting professionals who can immediately make valuable contributions to our Marketing operations. You'll be responsible for defining new markets, planning, and strategies, product pricing and promotion, including business decisions affecting your areas. In short, you'll be a prime driving force in the marketing structure of this group.

Management positions are available in each of the following marketing areas: School Districts, Community Colleges, and Universities.

The ideal candidate will be an aggressive, creative Marketing professional with academic experience and a familiarity with this market. A knowledge of other systems and equipment in this field is essential. You should also be familiar with large systems and their applications in an academic/administrative environment. The personal qualities that will enable you to contribute to and help direct the Group's growth — decisiveness, ambition, and excellent interpersonal skills — are very important. In addition, you should have a Bachelor's degree in a relevant field, or equivalent, with an MBA preferred.

For the right person, we offer a very attractive salary and benefits package, plus the opportunity to go as far as your talents will take you with a world leader in the industry. To further investigage these positions, please forward your resume, including salary history to Doug D'Agata, Digital Equipment Corporation, 200 Forest Street, Marlboro, Massachusetts 01752.

We're the company looking for people.

Newton, Mass. 02160

Grow with Amdahl and be a part of the future. MVS expertise needed.

Like to shoot dumps? Amdahl needs:

FIELD SUPPORT REPRESENTATIVES

You should have good MVS internals experience and the ability to debug, plus expertise in one of the following areas:

- VTAM/NCP
- JES 3
- VSAM
- TSO/TCAM

Current openings are in Sunnyvale, California.

Like customer contact? Amdahl needs:

SYSTEMS ENGINEERS

At customer locations. You should have MVS diagnostic expertise and the ability to be a jack-of-all-trades.

Currently there are several openings throughout the United States.

Like to do both of above with travel? Amdahl needs:

HEADQUARTERS SYSTEMS ENGINEERS

To work with Field Engineers at customer locations to solve more difficult bugs.

You should have very good diagnostic techniques preferably with some MVS experience.

Current openings are in Sunnyvale, California.

NO MVS EXPERTISE? Drop us a note anyway. We also have systems engineering openings that do not require MVS experience.

Please direct your response to Amdahl Corporation, 1250 East Arques Avenue, Sunnyvale, CA 94086 and indicate 310-D on your resume or letter. We are, of course, an equal opportunity employer.

Data Processing

Growth In IMS Data Processing

Many Opportunities!! Major Expansion Effort!!

At CNA Insurance, innovation is never on vacation. We're constantly looking for the new way—the better way...and that applies to our internal operations as well as our marketing approach. The current expansion of our Information Services Division-Claims Systems is an example of things to come!

We're adding to our staff in many ways and that means excellent ground-floor opportunities and high visibility for the professionals who join us. If you'd like to be a major contributor in a rewarding, highly competitive environment, take a look at these openings:

PROGRAMMERS

In addition to several junior level programmers who have some COBOL programming experience and preferably some knowledge of IMS Data Base, we're also looking for more advanced programmer analyst/ consultants who can bring 4-6 years programming experience including COBOL and IMS Data Base to these positions.

PROJECT LEADER

This position has hands-on involvement and direct functional responsibility for several analysts and consultants on medium and large scale projects for claims processing. A degree in Business, Computer Science, Insurance or Math backed by at least 7 years experience in systems and/or personal and commercial insurance (systems related) will be essential. Excellent written/verbal communications ability is a must and a background in claims related processing is preferred.

SYSTEMS ANALYSTS

Successful candidates for these challenging positions will analyze current group systems and future requirements for new systems in the claims area. Responsibilities include collection/analysis of factual material on current systems, interviewing various users, defining informational needs, and documenting findings and recommendations.

PROJECT SUPERVISOR

As a Project Supervisor for Manual. Systems Development you will have project leadership responsibility for the analysis, design and implementation of major corporate systems. Requirements are five to seven years of systems analysis and design experience in the area of manual administrative processing systems. One to two years experience in project leadership, planning and control is also required.

We are presently looking for project supervisors with insurance industry background – claims experience preferred.

SENIOR SYSTEMS ANALYST

As a Senior Analyst for Manual Systems Development you'll be responsible for the design and implementation of the manual (people) portion of large corporate systems projects. Requirements are three to four years experience in manual systems design and methods, with a thorough knowledge of project planning and administrative processing techniques. Project leadership and effective communication abilities are a must.

We are presently looking for an analyst with insurance industry background – claims experience preferred.

Our rapid industry growth spells FUTURE for you...in addition to genuine career advancement potential we offer competitive starting salaries, excellent company benefits including liberal relocation policy, and a dynamic, highly professional atmosphere. Send a detailed resume stating position of interest and salary history, in complete confidence, to:

Phil Gniot

INSURANCE FROM CNA

CNA Plaza
Chicago, Ill. 60685

An Equal Opportunity Employer m/f

SR. SYSTEM ANALYST

NCR offers significant challenge and growth potential to highly qualified programmer analysts who want to take part in the design and implementation of a state-of-the-art distributed processing system. This system is in the early design stages and the time to join the program is NOW!

Our system is business-oriented since our customers will be primarily COBOL users. It provides multiple modes of processing in a distributed data base environment. All our development is done interactively and all our software is written in high level languages.

We want people who have taken part in the design and implementation of at least one successful, modern operating system. Data base and data communications knowledge is a definite plus. We offer a highly competitive compensation plan and an outstanding benefits and relocation package.

We are located in a beautiful rural area, yet are just minutes from San Diego, beaches and mountains, and several universities. Recreational, cultural, and educational opportunities abound.

If you are results-oriented and experienced in O.S. design we want to hear from you. Please send your resume and salary requirements in confidence to the Professional Placement Office at the address below:

A Very Good Year for Us. A Better One for You?

Most computer professionals are aware that today's most advanced large-system technology was developed by a company that, not too long ago, was virtually unknown.

Now the phenomenon is widely known. Amdahl's 470V/6 performs as promised. And the company performs as promised: our hardware and software support exceeds the established standards.

Not well known, however, is that this major supplier of large systems is still, in terms of staff size, relatively small. At Amdahl, you're not lost in a sea of people: we began 1976 with less than 400 people and ended it with less than 800. There's still room on the ground floor.

We're looking for above-average talent. You can expect an above-average compensation and benefits package. Please direct your response to Employment Manager, Amdahl Corporation, 1250 East Arques Avenue, Sonnyvale, CA 94086. We are, of course, an equal opportunity employer.

Immediate openings throughout the U.S. and Canada. Field candidates will undergo a training period in California on full salary with housing, transportation, and other expenses provided.

FIELD ENGINEERING SPECIALISTS

You will have a minimum of 5 years' experience in maintaining large-scale systems with in-depth training on compatible CPUs. You will have company support in assisting the Amdahl customer in his mixed-vendor environment to maintain full operations in his center. Openings in several major cities and at Amdahl headquarters in California. Please indicate 560-E on your response.

FIELD ENGINEERS

You will carry the Amdahl philosophy of customer service as well as your expertise into the field, utilizing your initiative and talents to aid the customer in restoring computer center operations regardless of the origin of the failure. Large system experience essential, preferably on compatible equipment. Please indicate 567-3E on your response and direct it to the Amdahl regional office nearest you as shown below.

Computer System & Software Engineers

You can get ahead faster with us than with anybody else.

Here's why:

1 You are needed right now. Our project teams are crying for good professionals who can grab hold fast.

2 You'll get a chance to prove how good you are. Everybody is evaluated regularly, there are no missing persons at TI. If you're good, you move up fast. No matter how long the people above you have been there.

3 You'll be involved in state-of-the-art projects. Air Traffic Control. Satellite navigation systems. Landing systems. Radar and infra-red sensor systems. Computer-aided design, manufacturing and electrical test systems, machine tool control, text processing and process control. Acoustic data and image processing. In addition, an Advanced Software Technology Department has been formed to develop state-of-the-art tools, procedures, and languages for computer system design and software production. TI is the technological leader in literally scores of product fields. This leadership has produced more than 5,000 patents.

4 You'll work on a complete system. No threat of getting locked into a repetitious specialty. You'll work on a small project team. You'll interface daily with other disciplines and other phases of your overall program

5 You'll work in a job-stable, multi-market situation. We have a variety of products and markets. We're not heavily dependent on any one of them — and neither is your job.

Entry Level or Experienced Openings for U.S. Citizens

Software System Designer
M.S. in Computer Science or Engineering and experience in design of software systems for real-time and interactive systems.

Computer System Engineer
M.S. or PhD in Electrical Engineering or Computer Science and five years experience in hardware and software design of real-time computer systems.

SENIOR SYSTEMS PROGRAMMERS

The State University of New York at Buffalo is expanding its senior systems staff to meet a challenging growth demand. Qualified candidates may expect to lead a wide variety of operating system software development and maintenance activities in support of research and instructional computing. SUNY/AB is currently supporting local batch, remote batch and time-sharing on a COC CYBER 173 under NOS. Development of a hierarchical distributed computing network and scheduling/queue-management software is planned for the near future. Substantial systems programming experience on large scale time sharing operating systems is required. In addition, candidates should have particular expertise with internals of language processors, I/O handlers, job and resurce schedulers, telecommunications software, or performance measurement and evaluation techniques. Experience with KRONOS, NOS, COC software, hardware and more than one operating system would be helpful. Salaries competitive. Excellent fringe benefits. Eligibility for future permanent appointment.

Buffalo offers a wide variety of summer and winter sports and cultural events. We have excellent spectator sports, water sports, and nearby camping and skiing. In addition to a first rate symphony Orchestra and local jazz and theater, the summer Shaw Festival and the city of Toronto are a short drive away.

Application deadline for both positions is July 31, 1977. Write or call in confidence.

Software Professionals:

If you have a background in Systems Analysis, Systems Programming, Operating Systems Support, Data Base Management or Software Course Development and Teaching, we would like you to consider a unique opportunity to broaden your technical background while imparting your expertise to Digital employees and customers.

In this high visibility position, you will interface with many levels of Digital employees and customers. You will be responsible for determining and developing a broad range of advanced software instructional course material required for the support of both current and future products.

As a member of our Educational Services Group you will be involved in the following areas of technology:

- Data Base Management
- Data Communications
- Commercial Applications
- Computer Networks
- Operating Systems
  (DOS, IAS, RSTS, RSX-11, RSX-20F,
  RT-11, TOPs-10, TOPS-20)
- Programming Languages
  (ALGOL, APL, ASSEMBLY, BASIC, BLISS, COBOL,
  DIBOL, FOCAL, FORTRAN, RPG)

If you are a highly motivated self-starter who can conceptualize what is required to solve specific problems and then develop the resources to solve the problems within a dynamic, unstructured environment, we would like to talk to you.

Additional positions are available in Hardware Course Development as well as for Software and Hardware Instructors.

An Equal Opportunity Employer

The Data Processing Authority of Multnomah County, Oregon, currently has a 370/155 with DS and HASP. We are running a large teleprocessing system interfaced to DL/1 and other data base systems. We currently have openings for:

MANAGER—APPLICATIONS SYSTEM DEVELOPMENT

A middle-level management position reporting to the Director of a regional government data processing facility exists for an aggressive, experienced data processing professional. The successful candidate will immediately take responsibility for a portfolio of applications projects currently budgeted at about $400,000 annually.

The facility is strongly committed to quantitative approaches to all data processing functions. Applicant should provide details in support of resume demonstrating experience with this management process. Salary history also required. Initial screening will be based on quality of experience details submitted.

Annual salary is $24,000 to $25,400.

SYSTEMS ANALYSTS

Responsible for administration and technical management of multiple automated systems from feasibility study through implementation. Position requires demonstrated success in the design and implementation of major systems projects, prior supervisory responsibility, project planning/management skills, familiarity with data base management and telecommunications concepts, and proficiency in COBOL. The applicants must also demonstrate excellent written and oral communications skills.

SYSTEMS PROGRAMMERS

To work in the areas of DS and HASP maintenance, data base management systems (DL/1 and others), telecommunications, and capacity management. Position requires experience with DS/MFT OS/MVT, HASP, assembler language, JCL, and utilities. Experience with teleprocessing systems and data base systems (particularly DL/1) also desirable.

Multnomah County is an equal opportunity employer and provides excellent benefits including medical and dental plans.

Data Processing

SAN DIEGO DATA BASE DESIGN ANALYST

Salary to $1,793 mo.

A challenging position is open to a qualified Data Base Design Analyst with The City of San Diego. Responsibilities include the design of IMS data bases; generation of DBD, PSB, and MFS control blocks to support applications needs; and providing technical support to the systems development staff in developing IMS applications.

Equal to college grad. and 4 yrs. exp. in systems analysis and programming of major business applications including 2 yrs. in designing IMS data bases and providing technical support in the development of IMS DB/DC systems. Exam process consists of personal interview which may be done by phone after application is approved.

VERSATILE EDP PROFESSIONAL

Major New York City bank seeks a Versatile EDP Professional for a challenging and creative position.

Responsibilities include: the analyzation of current EDP Systems to determine proper and effective use, design and modifications that may be required, and code changes. Perform feasibility studies to determine the development of long range systems plans for a broad spectrum of applications to be used for its international subsidiary companies.

Exposure in banking such as: commercial loans, time and demand deposits, FX, L/C or accounting would be helpful but not necessary.

Complete familiarity with Burroughs L series Computers.

The ideal candidate should be able to work independently and be a strong communicator.

Travel in the United Stated and Canada.

Salary commensurate with experience. Excellent compensation package.

Write in confidence to:
P.O. Box 495
Church Street Station
New York, NY 10015
Company is an Equal Opportunity Employer

Data Processing Professionals...

The Ralph M. Parsons Company offers an exceptional opportunity for career development in a challenging and dynamic environment to qualified data processing professionals. Immediate openings exist for Programmer/Analysts with a minimum of 3 years' experience in the design, implementation and support of large scale commercial data processing systems.

Intel delivers more semiconductor memory than anyone. Even IBM.

When you select a computer, it often makes sense to choose IBM. Because of their size, industry acceptance, installed base and technological leadership in computers.

But when it's time to select a memory supplier for your IBM computer, it always makes sense to choose Intel. For the same reasons.

Intel is the world's largest supplier of semiconductor memory. Over 53 billion bits shipped in 1976 alone. That's more than IBM has shipped domestically during the life of System 370.

We became number one in semiconductor memory by applying marketing strength to technological leadership. Technological leadership is what you expect from the company that invented the world's first microprocessor. And marketing strength is what you expect from the world's largest supplier of microprocessors and semiconductor memory.

Intel's financial strength and security take the risk out of selecting an alternative to IBM. We're over a quarter billion dollars strong.

And we've built an organization to equal — and often surpass — the sales, service, support and confidence you expect from IBM. Intel has over 600 IBM 370 series memories installed at companies like yours.

We could not have made it to number one if we didn't offer you more than IBM. Our memories deliver significant cost savings when compared to IBM memory prices. And we're the only independent supplier to offer a complete line of 370 memories — from System 125 through System 168.

Our memories go beyond compatibility with all IBM features and configurations. Enhancements — such as our unique microprocessor-controlled maintenance and diagnostic features — give you operating flexibility and reliability second to none.

Intel is your logical choice for System 370 memory. So whether you're planning a new 370 installation or upgrading existing capability, talk to Intel. Phone us at (408) 734-8102. Or write: Intel Memory Systems, 1302 N. Mathilda Ave., Sunnyvale, CA 94086.

intel delivers.

Booms Away

By Ann Dooley
Of the CW Staff

LOS ANGELES — Noise pollution is being studied and often reduced at several airports across the country using a computerized monitoring system that can separate jet aircraft noise from other noise.

Installed in communities bordering airports in San Diego, Los Angeles and Ontario, Calif., as well as in Hawaii and Washington, D.C., the systems rank the severity of aircraft noise in the area in comparison with other neighborhood sounds such as cars, trucks, lawn mowers and bark-

Unsigned IBM Trial Paper Pops Up Again – Identified

By Edith Holmes
Of the CW Staff

NEW YORK — The U.S. antitrust case against IBM has always been a battle of papers — internal IBM papers.

Now, in one of the more puzzling aspects of the case, a new set of papers indicates IBM attorneys and executives may have known more about certain documents than they previously admitted in court.

The whole matter resembles a jigsaw puzzle and government attorneys are just now putting together the pieces of this particular part of the puzzle — even as their case goes into its final stages.

The flap started last Oct. 19, when government attorneys subpoenaed seven IBM executives to appear in court in order to identify certain unsigned documents taken from IBM files [CW, Oct. 25].

Such identification is important. IBM attorneys have argued the documents should not be given credence by the court unless the Justice Department can show who within IBM wrote them and who received them. Without such identification, they cannot be considered business records of the corporation.

The group never testified. Referring to one of the documents headed "Action," lead IBM counsel Thomas D. Barr told the judge and government attorneys that "none of [these] persons know who wrote the document, wrote it themselves or ever saw it before to the best of their recollection."

Appearing outraged, Barr called the government's subpoena of the IBM executives "nothing more than a case of blackmail."

Shift of Scene

Almost two months later, on Dec. 20, the government again introduced documents. An IBM counsel identified one of them as having been written by L.L. Spector, IBM business practices adviser.

The name Hilary Faw, then director of business practices and now IBM assistant treasurer, was signed on the document by Spector since Spector worked for him at the time, the attorney said.

Both Faw and Spector were among the seven executives in court on Oct. 19, but the new document did not connect them with the earlier document, of which their attorneys claimed no knowledge.

Then, on June 8 of this year, Judge David N. Edelstein released certain documents to the government after stripping IBM's previous claim of "privilege."

In this group of documents there was a surprise — a six-page flip chart presentation which essentially included both of the earlier documents, the one identified as having been written by Spector and bearing Faw's signature as well as the one that no one could previously identify.

The presentation, made on Dec. 9, 1968 to a meeting of IBM's general managers, is entitled "Share Measurements Change: Why and Action." The presentation was made by Faw with the blessing of Frank T. Cary, now IBM chairman and then a senior vice-president and general manager of the DP group — and one of the IBM executives said to be unable to identify the Oct. 19 document.

Since one page of this new document is essentially the same as the one previously

Plans Study, Quick Action

Carter Team Eyeing Federal DP Revamp

By Don Leavitt
Of the CW Staff

WASHINGTON, D.C. — Even DP has not escaped the scrutiny of Carter Administration officials looking for ways to streamline the government.

The President's Reorganization Project in the Office of Management and Budget (OMB) has begun a comprehensive examination of all federal DP procurement and management, according to project associate director Wayne G. Granquist.

"The management of federal DP resources is a significant factor in the delivery of governmental services and the operations of government," Granquist said in a recently circulated letter which noted that in this fiscal year the government "will spend over $4 billion and employ more than 150,000 people in the area of general-purpose DP."

At the same time, "there is a growing recognition these resources are not being acquired and managed in the most economic and efficient manner," Granquist said in asking for advice on the reorganization of federal DP resources from people both within and outside the government.

Thre is also concern that this technology "represents a threat to individual privacy," the government official added.

The study project, organized into half a dozen or more task forces, will focus on three basic areas, the director said:

- Improving productivity in the delivery of government services through the application of computer technology.
- Improving the acquisition, management and use of these resources.
- Eliminating duplication and overlap in agency jurisdictions dealing with computer questions.

With those objectives, the project also has three basic criteria, he added. It should be based on "careful and comprehensive analysis" and it should be conducted in a way that permits "the largest number of people" in and out of government to be involved.

Finally, it should be a "decision-forcing, action-oriented process," Granquist said.

In essence, Granquist's job in this and other reorganization efforts is "trying to capitalize the 'M' in OMB," he told the Interagency Committee on Automatic Data Processing when he addressed that group in June.

Granquist's letter invited addressees to submit comments to him on the "issues, problems and solutions" that should be considered by the project. He urged recipients to make copies of the letter for other persons and organizations "who might be interested in submitting separate responses."

Even without a copy of the letter, anyone with an interest in the management of the federal DP resources is welcome to send in comments, OMB noted. Although Gran-

Justice Puts Brakes On FBI Switching, Plans Further Study

By Nancy French
Of the CW Staff

WASHINGTON, D.C. — The Justice Department has formally revoked a memorandum authorizing the Federal Bureau of Investigation (FBI) to develop a computerized message-switching system.

The system, which would serve but could also monitor the communications functions of state and local law enforcement agencies, was turned down by the Ford Administration as a threat to privacy and civil liberties. The message-switching plan brought cries of "Big Brother" from congressional critics who had hoped the plan was dead. However, the system surfaced again recently [CW, June 27].

The revocation came in a memorandum from Deputy Attorney General Peter F.

Ifip Congress Next Month Set To Face Wide Variety of Issues

By E. Drake Lundell Jr.
Of the CW Staff

TORONTO — The world's most comprehensive program on important computer issues took place last month at the National Computer Conference, right?

Wrong.

The 1977 Congress sponsored by the International Federation for Information Processing (Ifip) here next month promises to earn that title with 108 technical sessions and 30 "mini" symposia on a wide variety of issues ranging from the forefront of technology to nitty-gritty data center management.

In addition, Ifip promises an in-depth examination of important social issues facing the computer community and society at large when the Congress meets Aug. 8-12.

All sessions will be available in English

The effect of computers on employment will be highlighted in two of the social issues sessions. The first of these, chaired by U. Briefs of West Germany, will discuss the overall effects of the introduction of computers on the job market with speakers from the U.S., Denmark and Canada.

The second, under the direction of F. Margulies of Austria, will delve into the "Impact of Computerization on Work Content and Job Satisfaction" with speakers from Denmark, Sweden and Hungary.

Most of the major countries in the Western industrialized world including the U.S., Canada, France and West Germany will be represented on another panel dealing with "the Social Accountability of Computing" which will be chaired by R. Kling of the

Ifip to Face Wide-Ranging DP Issues

(Continued from Page 1)

United States.

"Is the Erosion of Privacy an Unavoidable Consequence of Computer Applications?" will be the question for a panel headed by F. Gallouedec-Genuys of France that will draw on expertise from Australia and Sweden.

The final session targeted for dealing with social issues will delve into the "Impact of Computerization on Leisure Activities" and will be chaired by H. Borko of the U.S. with participation from British, Danish and Canadian speakers.

Besides those five sessions specifically on social issues, several others will also touch on areas of societal concern, including "Safer Use of Computers," "Distributed Systems: Operational and Privacy Requirements," "Economics, Organizational and Social Implications of Computer-Aided Design," "Systems for Public Planning and Control," "Models of the Environment" and "Data Bases, Business Systems and Privacy."

In addition to the social impact sessions, Ifip will also look into the crystal ball to help define the future of computing with such sessions as "Future Potentials in Computer Communication," "Data Networks Past, Present and Future," "Future of Data Management," "The Impact of Microcomputers on Computing," "Future Directions in Information Management" and "Future Directions in Computer Architecture."

Artificial Intelligence

There will be several sessions on the esoterica of artificial intelligence, but session organizer Y.D. Shmyglevsky of the Computer Center of the Academy of Science in Moscow noted the area may not be all that esoteric.

"There is a firm conviction among researchers that the 'human' style of 'user/-computer interaction, long envisioned by science fiction writers, will become a reality in the near fuure," Shmyglevsky stated.

In another area, Prof. Eric Manning of the University of Waterloo in Canada said the combination of computers and communications will make computer power as accessible as electricity.

"The same technology used for telephone lines, cable TV systems and space satellites now links computer terminals to remote computers and computers to each other. Telecommunications facilities already permit people to use computers across town, across the country and even in other countries.

"Great as their potential is, there are still many unresolved problems which the invited and contributed papers at the Congress will examine," Manning, who organized the communications section of the program, added.

In still another area, Prof. R.I. Tricker of the Oxford Center for Management Studies in England will focus on the impact of information systems on organizational thinking.

In a modern society, he said, information is increasingly connected with the exercise of power, but many existing information systems fail to respond to this challenge.

Looking beyond the technical and operational level, he said that management information is ultimately the outcome of human thought and that the information system designer now has the potential to contribute to the further evolution of his organization.

The conference program will also draw a large number of speakers looking into such topics as programming management, data base design, information systems development, modeling, program structure and specifications as well as other topics of interest to software developers and users.

Educators will also have a wide choice of sessions, ranging from ones on computer science programs to the use of computer-assisted instruction. Computer scientists will be treated to sessions ranging from finite elements and numerical analysis to the theory of data bases and programs.

The wide-ranging program, in which experts from more than 40 countries will participate, will feature 124 papers culled from 511 submitted for the program, in addition to 24 papers specifically requested from various experts in the industry worldwide.

Although it will be held on the North American continent for the first time since 1965, the Ifip program will be truly international in scope with speakers from — among others — the USSR, Japan, East and West Germany, Italy, France, Poland, Hungary, Sweden, Denmark, The Netherlands, the UK, Australia, Austria, Norway, Iran, India, Israel, Switzerland, Belgium, Finland, Nigeria, Hong Kong, Bulgaria and Mexico, as well as large U.S. and Canadian contingents.

Registration fees for the conference are $145. Forms and additional information can be obtained from the Organizing Committee for Ifip Congress 77, c/o Canadian Information Processing Society, Suite 214, 212 King St. West, Toronto, Ont., Canada M5H 1K5.

Room for Exhibits

TORONTO — While the International Federation for Information Processing's (Ifip) Congress 77 here next month promises an action-packed technical program, the exhibit space is still not sold out, and late starters still have a chance to join the 130 exhibitors already signed up for the show.

The 130 already participating will occupy approximately 260 booths, Ifip organizers said last week. There is room for 325 booths in the Sheraton Center exhibition hall here, the site for both the exhibit and technical sessions.

Information on exhibiting can be obtained from the Exhibits Manager, Ifip Congress 77, American Federation of Information Processing Societies, 210 Summit Ave., Montvale, N.J. 07645.

CDC Loses Account After IBM Testimony

NEW YORK — Control Data Corp. lost an $800,000 account with Sollac, a French firm, after one of the Minnesota-based company's employees testified at the U.S. vs. IBM antitrust trial recently [CW, June 27].

Although CDC sent a letter of apology to Sollac, for any embarrassment caused by the testimony of Gordon Brown, CDC's vice-president in charge of marketing and planning, the customer still decided to order IBM plug-compatible disk drives from Itel Corp.

Brown had testified that Sollac was reconsidering an order for a CDC disk drive after it learned IBM may soon be announcing an enhanced version of its 3350 disk drive.

Sollac was visited by IBM representatives as a result of the testimony, and the French DP manager complained to CDC that the preannouncement information was given to CDC in confidence.

In CDC's letter of apology, the company called the situation a result of an "erroneous interpretation" on its part.

Anonymous IBM Trial Document Reappears — Identified Now

(Continued from Page 1)

identified as having been written hy Spector, government attorneys have concluded the entire June 8 document was written by Spector or by Spector and Faw under the direction of Cary.

Crucial Documents

All of the documents concerned are important because they involve an internal IBM program called "Project Yardstick" that changed the way IBM collected market share statistics.

The government has contended that Yardstick — which was instituted after the firm knew it was under antitrust investigation — was designed to make IBM's share of the market look less monopolistic. The previous measurement system, accoridng to the government, showed IBM had market dominance.

The newly released six-page presentation document itself states the business, antitrust and legal reasons why IBM executives thought they needed to change the corporation's ways of measuring its share of the computer market.

Having told the Justice Department how to measure the market in the computer industry and what general scope of products should be included in that industry, the presentation pointed out that IBM's internal measurements did not agree with what the government had been told.

Records to Reflect Thoughts

"We must have our records reflect our thinking. We must not put IBM's executives in an untenable legal position relative to market share data in their files if they were to be called to testify in the future," the exhibit stated.

Furthermore, IBM's outside legal counsel had requested that the changes in share measurement be made, the document noted.

The fifth page of the presentation document — headed "Action" — suggested the elimination of "net position" in share measurements. The DP group should be responsible for implementing improved competitive measurements, and changes should apply to all components of the group, this page stated.

Some management personnel would be reluctant to make these changes, the document continued, noting the changes would make the IBM market share appear to go down.

The same day Faw made the presentation, Cary ordered the recommended changes to take place, effective in January 1969.

When Barr made his report to the court last October concerning the "action" documents and his and the seven IBM executives lack of knowledge about it, he stated: "There are many documents in the IBM Corporation headed 'Action.' There are a suhstantial number which I have seen in the last few days which have subject matters on them not terribly different, or somewhat similar, or vaguely related to the same subject matters on this sheet of paper.

"I do not know who wrote the document. I have looked very diligently," Barr added.

The IBM attorney then maintained the government could not offer the "Action" document as the view of IBM management and as an admission of the corporation and a husiness record without knowing who wrote it.

Lead government counsel Raymond M. Carlson responded last fall hy stating that much of what Barr had told him about the document that day was exactly the kind of information the Justice Department sought.

IBM's claim of privilege for portions of many documents confused the government's receipt of them in the proper form and illustrated "the advantage to a corporate defendant of the tool of privilege to delay a trial proceeding," Carlson said then.

Barr, contacted ahout the apparent discrepancy just before press time, denied he now knows any more about the documents in question than he did last October.

Pointing out that he "didn't have the whole thing in my head," Barr said, "certainly if I knew of anything inconsistent with what I told the court I would have said so."

The inference that Spector wrote an entire document merely because he wrote one page of it is "kind of thin," he added.

Correction

The college curriculum described in "University Producing Grads 'Pretrained' in Business DP" [CW, May 2] is offered hy the State University College at Buffalo and not hy the State University of New York at Buffalo.

DP Buyer Charged With Kickbacks

NEW YORK — The U.S. Attorney's office in the southern district of New York has brought hefore a grand jury here its second case of kickbacks involving the purchase of computer paper supplies.

The jury indicted a former Pan American World Airways purchasing official, William Hasenstab, for allegedly receiving $45,000 in kickbacks from Tabulating Stock Forms, Inc. as a result of selecting that firm as a supplier for the past 11 years.

Hasenstab is scheduled to be arraigned July 14. No trial date has been set, according to John Wing, assistant U.S. attorney.

Tabulating Stock Forms was also named in the case involving Hartz Mountain Corp., in which a former Hartz official, Eugene Corey, received concurrent one-year prison sentences on three counts [CW, Feb. 7].

In that case, Corey was charged with receiving kickhacks of more than $60,000 from Tahulating as well as from Commercial Forms, Inc., while the paper companies made short shipments to Hartz amounting to more than $125,000.

George Barney, president of Tahulating, has not heen sentenced yet and Donald H. Krasner, president of Commercial Forms, cooperated with the government and received a suspended sentence, Wing said.

In the Pan Am case, Tahulating is named as a coconspirator and charged with two counts, conspiracy and fraud, for which the maximum sentence is 10 years, according to Wing.

A Pan Am spokesman had no comment on the matter, adding Hasenstah resigned last spring.

ADR's Automated System Charter™ (ASC) Helps Mobil Oil Stay Ahead

Change at Mobil Oil's New York Headquarters DP Department is a way of life. Over 300 systems are in constant use. And this year 100 systems may be extensively changed and 20 new ones added. "Maintaining up-to-date, standardized systems documentation by hand would be nearly impossible," according to Client Services Supervisor, Jean-Louis Legrand.

ASC produces new documentation in minutes

Mr. Legrand recently helped Mobil Oil install ADR's Automated System Charter (ASC) as a primary tool for computerized documentation maintenance. By using ASC, Mobil has gained many advantages including the establishment of new and simpler standards for programmers. Each time there is a system change, the programmer describes the change on a form submitted through one of Mobil's Client Coordinators for entry into ASC. This results in an automatic documentation update which can be sent throughout the DP Department by printing out a completely new report, produced at only a fraction of the former cost. Reports which would have taken up to 4 days to organize and type manually are now produced in a few minutes — automatically, through ASC.

ASC lets Mobil run systems faster

ASC gives Mobil's Client Coordinator a comprehensive, uniform, and up-to-date tool containing all the instructions he needs to run a system. Because ASC automatically standardizes documentation, the Client Coordinator understands a system faster and can run even a new system after only a few hours of study.

"An important aspect of the ASC document is that it now contains a very clear definition of all the reports coming out of a system along with detailed instructions on how they are to be distributed," Mr. Legrand added.

Improved backup is important

ASC has enabled Mobil to record all system documentation on one tape, with JCL in one library and descriptive comments in another. By dumping these two libraries, Mobil has full backup of all or any part of their documentation. Any report can be reproduced in just a few minutes.

No longer any doubt about being up-to-date

"With ASC, being up-to-date is almost automatic. When changes recur, ASC gives our Client Coordinators the ability to quickly make a copy of the complete, updated document so that everyone can work with the latest information," said Mr. Legrand.

ASC improves system chart quality, cuts costs

"ASC has let us document a system in about half the man-hours we would have normally used. And we have the advantage that the results are more uniform and complete. We do not miss steps as we might in a manual report, and the system chart and program steps are always printed in the same way," Mr. Legrand concluded.

ADR software products are an integral part of over 5,000 installations worldwide. Each ADR product is not just a program, but a complete package with full documentation and on-site support. ADR is the only software company with 50 branch offices and representatives in over 30 countries — each staffed with ADR-trained technicians.

Economist McAdams Has No Doubts: IBM Is a Monopoly

By Edith Holmes
Of the CW Staff

NEW YORK — IBM has monopoly power in the general-purpose digital computer system line of commerce — the corporation not only possesses the power to control prices in this market; it also has the power to exclude competition, according to Dr. Alan K. McAdams, chief economist on the U.S. government's trial team in its antitrust suit against IBM.

McAdams based his conclusions on the trial record and some 20 years of study of the computer industry throughout his graduate work at Stanford University's School of Business and now at Cornell University.

McAdams first became involved in U.S. vs. IBM in September 1971 when, as a senior staff economist with the President's Council of Economic Advisors, he was asked to determine whether there was any economic merit to the Justice Department's then-pending suit against the corporation.

Now on the stand as the government's summary witness with the task of tying together testimony and documents contained in the trial record, now over two years old and more than 53,000 pages long, McAdams said those companies that have been moderately successful in business DP have had to find "niches" in the marketplace where they could compete unperturbing to and therefore undisturbed by IBM.

Attempting a "formal assault" on IBM with a full line of equipment and services has not worked, McAdams said, citing IBM internal studies already in evidence.

Of the other mainframers in existence today, Honeywell is the only company that has successfully entered the business DP industry since the advent of computer technology without the benefit of a prior user base in products like accounting machines and tabulating equipment, he said.

Firms like Control Data Corp. and Digital Equipment Corp., for example, have won user acceptance in the scientific marketplace but have not done overwhelmingly well in marketing their machines for business applications, he contended.

'Opportunities to Fail'

To compete in business DP, a firm must market a combination of hardware, software, maintenance and service. This combination, in turn, must be capable of running a broad range of commercial applications, McAdams explained.

The firm must be prepared to lease its systems if it is to be an effective competitor in the marketplace. In addition, it must offer the user at least a promise of a compatible family of systems, the economist who helped government attorneys write the Justice Department's trial brief said.

"The industry offers multiple opportunities to fail," McAdams stated, referencing the testimony of executives from those firms which have exited from the business — notably General Electric (GE), RCA and Xerox. GE's and RCA's respective "full line approaches" and their failure indicates the wisdom of the niche market philosophy, McAdams suggested.

"If a market is truly competitive, both entry and exit are easy," the economist told Judge David N. Edelstein. The resources that GE, RCA, Xerox and Singer invested in the industry and the losses with which they left it suggest substantial barriers to entry, he contended.

All the measures that can be used to determine barriers to entry are indirect, McAdams cautioned. Among them, however, is IBM's own financial status.

IBM profits in the 1971-72 timeframe, the period most closely reviewed by McAdams, were unusually high compared with the rest of the economy and unusually stable, he said.

In addition, in 1976 IBM had a cash "hoard" of $6.1 billion and operating assets amounting to an annual return to cash flow of 50 cents on the dollar, McAdams testified.

Further, IBM uses conservative accounting practices and one of the most rapid forms of depreciation possible, he added, which helps to mask its true profitability.

Evolving Definition

Turning to the definition of "computer system" and how it has changed over the years as technology has evolved, McAdams told the court that between 1960 and 1965 it was possible for a firm to be an effective competitor by offering a single system of the small, medium and large varieties.

Systems in each size category did not have to be compatible then and rudimentary operating systems were considered useful but not required, he recalled.

Burroughs' work between 1965 and 1970 on its B5000 Master Control Program and IBM's promises for its 360 series announcement in 1964 made reasonably comprehensive operating systems and a family of software-compatible systems essential, according to McAdams.

From 1970 through today, this evolution of what constitutes a system has continued. Today manufacturers promise users that their systems operating software can handle various modes — batch, on-line, timesharing — simultaneously, he said.

Again citing IBM internal documents, McAdams stated that IBM announced the 360 prior to the time it conformed to IBM test procedures for announcement of a new product. The software for the family of compatible computers — OS/360 — hadn't even been specified when the announcement was made in April 1964.

IBM's actions in producing and marketing several members of the 360 family — particularly the 360/44, the 360/67 and the 360/90 — represented the corporation's efforts to create and defend its market share in the medium-scale scientific, time-sharing and prestige scientific markets respectively, according to McAdams. IBM's major motivation was not service to users, but the prevention of competitive inroads in these markets, he said.

With a performance in the range of the 360/50 and a price approximating that of the 360/30, the Model 44 was intended by IBM to blunt CDC's success in the medium-scale scientific market, for example, McAdams testified.

Not wishing to provide all its users with the price/performance ratio it offered this segment of the scientific marketplace, IBM designed the Model 44 to be incompatible with the rest of the 360 line so the machine would not attract the corporation's commercial or business DP users, the economist stated.

In addition, the 40 and 50 were high-profit machines, producing about 30% profit on revenue before taxes, while the 44 was planned to be very close to the break-even point, McAdams said. And the 44 cost IBM something to produce — with production facilities tight, every 44 made meant one less 40 or 50, he added.

Anti-Lessor Strategy

IBM treated its leasing company competition in a similar manner, changing the purchase/lease ratio on its 370 line to discourage the growth of leasing firms which bought up 360 CPUs and leased them to users for better-than-IBM prices, McAdams said.

IBM promoted the concept of risk leasing or rental of general-purpose computer systems and opposed an encroachment on that market by independent leasing companies because the system allowed IBM to retain "complete control of its property," he added.

"The viability of IBM's risk lease is dependent on price leadership and price control . . . by means of price leadership, IBM has established the value of DP usage," an internal IBM document written in November 1969 and used during McAdams' testimony said.

By retaining control over its machines which were out on lease, IBM could also maintain the value of DP usage, McAdams indicated. It controlled that value by such acts as "timing of new technology insertions; functional pricing; coordinated management of delivery; support services and inventory; refusal to market surplus used equipment; refusal to discount for age or for quantity; strategic location of function in boxes; 'solution selling' rather than hardware selling; [and] refusal to support subsequent use hardware," the IBM document said.

Leasing companies rose during the late '60s and, although they were in a sense still customers of IBM because they purchased systems, the manufacturer saw them as "insidious" because they reduced the number of rental customers available to IBM, a second IBM document said.

The average system life was extended by leasing companies because they kept a system out on lease longer than IBM would have offered it, which reduced activity in the market, McAdams said.

"IBM's ability to extract profit no matter where the customer moved was influenced," he added.

Effect of 370

Leasing company activity was strongest with the 360/65 and 50. When IBM announced its 370 series line in June 1970 (a year earlier than expected), the majority of equipment in the leasing company portfolios was obsoleted, McAdams said.

The 370 announcement was specifically made with "clear impact on competing firms," which included leasing companies, he testified.

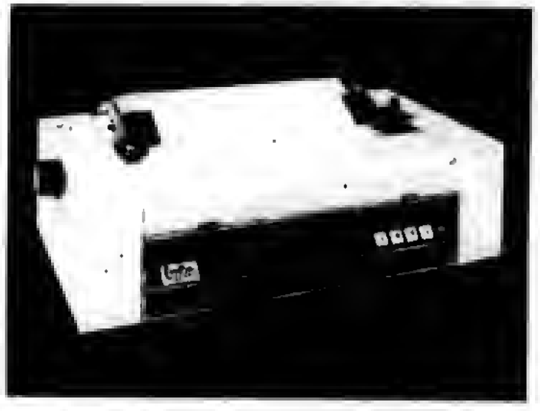
McAdams referenced a Fortune magazine interview of several IBM executives at the time of the 370 announcement which quoted Thomas J. Watson, then chairman of the IBM board, as saying that most of the corporation's troubles in the marketplace were caused by leasing companies rather than the recession going on at that time.

The 370 was an undesirable market for leasing companies because it had a "significantly higher" purchase-to-lease multiplier and higher maintenance charges, which made operating leases undesirable to third-party lessors, McAdams said. The 370 also offered better price for performance to users by having faster peripherals and a larger memory capacity which were unavailable on the 360, he noted.

Leasing companies attempted to compete by increasing the capabilities of the 360 to equal that of the 370, he said. They found it was feasible to go beyond the "arbitrary" limits IBM had set on add-on memory for the 360, he added.

IBM, however, refused to maintain its systems that had memory over the limits it had prescribed which made a negative impression on potential users, he added.

Hydra Printers
Run and Run and Run
24 Hours a Day
7 Days a Week
You Can Depend On It



A printer that goes down, immediately becomes a liability—whatever the service contract or arrangement. Better by far, in every respect, to use Hydra Ballistic™ Matrix Printers with their reputation for superior dependability . . . long trouble-free life month in and month out, and proved in installations worldwide.

HYDRA, the optimum choice for end-users, OEM's, system houses, data-communication networks, and for your particular application, whatever it might be.

Study Extraction Feasibility Methods

Minis Help Researchers Get Oil From Wyoming Shale

By John P. Hebert
Of the CW Staff

LARAMIE, Wyo. — Minicomputers are helping researchers here to develop methods of exploiting a virtually untapped energy resource: underground oil shale deposits.

Engineers and research scientists at the Laramie Energy Research Center (Lerc) here employed minicomputers as data collection devices last year in one of the first experiments to determine oil shale extraction feasibility methods.

The experiments, sponsored by the Energy Research and Development Administration (Erda), were aimed at finding ways to extract about 1.2 trillion barrels, or 50.4 trillion gallons, of the approximately 1.8 trillion barrels of oil believed to be in the shale in the Green River Formation of Colorado, Wyoming and Utah. Using conventional underground mining techniques only about 600 billion barrels of oil — or 21.3 gallons per ton — could be squeezed from the shale, according to Bruce Sudduth, project engineer for last year's Rock Springs Site 9 Retorting Experiment.

The Site 9 project concentrated on pumping a small part of the vast reserves in the Green River Formation that cannot be retrieved using the conventional "pillar" mining, Sudduth explained.

In some ways, Lerc failed in its efforts, Sudduth said. "The experiment was not very successful in terms of pumping large amounts of oil out of the ground. Out of a possible 2,000 barrels of oil, we recovered only 70 or 80 barrels," he said.

One of the main problems is that Lerc engineers were dealing with an unknown.

"We honestly don't know how to write good algorithms for this application . . . because we just don't know the composition of the resources," he said.

General Understanding

However, the experiment was successful in helping to determine how minicomputers can be better utilized as data collection devices in future retorting experiments, Sudduth said, and it also added to the general understanding of complex and unobservable underground conditions and reactions.

The Site 9 field experiment 200 miles northwest of Lerc headquarters entailed underground combustion (retorting) of the natural oil shale deposits and collection of product oil and fuel gases.

The project relied on a Hewlett-Packard Co. 9600 data acquisition and measurement system for temperature and pressure data acquisition and storage, real-time monitoring of certain experimental aspects, control of gas chromatographs, mathematical formulae computation and periodic summary outputs.

The 9600 was connected by cables to a 32K HP 2100 minicomputer located in a trailer adjacent to the well field. The 2100 system included an HP 7900 disk drive with 9.5M bytes of storage, an HP 7970 magnetic tape drive, paper tape reader and punch, HP systems for analog to digital conversion, and a crossbar scanner for multiplexing signals.

Computer Contributions

"One key advantage of the minicomputer systems was their capability to pull all the data in and store it on disk files for later analysis, at the field experiment site," Sudduth said.

Another important contribution of computer technology was evident during the ignition phase. The real-time capability of the system to monitor temperatures helped Lerc engineers to control power to a downhole electric heater and prevent heater damage, according to Sudduth.

Site 9 consisted of a center well used for initial ignition and afterwards for injection of air to sustain the underground combustion, four surrounding wells; four other production wells; and four observation wells drilled inside the test area, containing thermocouples at five levels down.

Each production well from the inner square was paired with one from the surrounding wells. The oil and gas outputs from the two were combined to feed a single demisting tower that removed oil mist from existing gases.

Lift pumps were used to pump oil from each production well. The main production well is a vertical shaft, 8-1/2 ft. in diameter. Air is injected and recycled in a process of spontaneous combustion to burn the carbons and retort the shale.

Gases Analyzed

An instrument room nearby was equipped with an HP 5830 gas chromatograph (GC) that was used to analyze gas samples piped from each production well pair.

Every 16 hours, bottled standard gas was fed to the GC for calibration purposes. The 2100 minicomputer controlled the injection of the samples, closure of the valves and collection of the GC voltage data.

The amounts of the various gaseous constituents were calculated for use in energy balance calculations to follow the progress of the underground reactions.

The instrument room also contained the manual backup system for the computer, which consisted of an array of strip chart recorders that read and plotted most of the temperatures and pressures as well as HP 2615 terminal and line printer.

An in-house-designed user program called Rascal assured that the minicomputer was easy to use while preventing users from "getting into the operating system and causing damage," an engineer explained.

Rascal, for example, made it easy for users to select an hourly summary for review interactively.

According to Mark Cunningham, DP specialist for Lerc, the HP system was used in this particular experiment because many of the project engineers are generally more familiar and experienced with it and also because HP offers real-time software packages that are easy to interface with user-developed programs.

The disk-based RTE-II system permits support of many different instrument and peripheral systems for real-time measurement, control and reporting. Multiprogramming capability allows users to develop programs and execute them at the same time that real-time data acquisition and processing is taking place, he said.

NOW--CA-SORT 77!

Installs in ten minutes-- start saving with first run!

Your FREE 15-day trial will prove everything you have read about CA-SORT 77, the amazing sort software system more than 1700 DP Managers have chosen to use in their own daily routine and environment!

START SAVING WITH THE VERY FIRST SORT RUN

Experience results like these:

- Save up to 50% on I/O activity!
- Save up to 50% on Disk Work Space!
- Save up to 25% on CPU time!

And ... you'll save turn around time, precious core space and find CA-SORT 77 easy to tune for maximum optimization

Overall - - you must improve throughput even during the 15-day FREE trial, or return the system and owe nothing!

CA-SORT 77 IS THE NUMBER ONE DATA-PRO SORT SYSTEM!

Not only is CA-SORT Number One on the Datapro survey - - it is the **only** sort software system to earn a position on the "super honor roll" ... the exclusive upper 1% of all sort systems!

CA-SORT USERS HAVE RECEIVED MORE THAN 50 ENHANCEMENTS SINCE 1974 - - ALL ABSOLUTELY FREE OF CHARGE!

Continuous world-wide research results in more effective use in typical CA-SORT installations! If you had installed CA-SORT in 1974, by now you would have received more than 50 improvements!

CA-SORT 77 incorporates every enhancement ... and is 15% more efficient than the previous release.

So - - try CA-SORT 77 free of cost. Just write or telephone **today**. The complete information kit will be rushed to you along with all the details of the trouble-free 15-day trial! Here's a coupon to start you on the road to savings!

Justice Revokes Go-Ahead for FBI Message Switching

(Continued from Page 1)

Flaherty to FBI Director Clarence M. Kelley that said, "we are thoroughly reviewing the subject of message switching in the Department of Justice in cooperation with members of Congress to determine whether the FBI should be permitted to engage in message switching and, if so, what guidelines should be administered to protect the public."

Retilling Same Ground

In the meantime, Rep. Don Edwards (D-Calif.), chairman of the House Judiciary Committee's Subcommittee on Civil and Constitutional Rights is reported to be driving toward some resolution of the message-switching problem, with hearings anticipated soon.

The subcommittee is trying to construct models of how the FBI's National Crime Information Center (NCIC) communications system now works, how it could work with added message-switching capabilities and how such a system could work outside of the aegis of the Federal government, a staff member said, acknowledging all this ground has been tilled before with expensive studies funded by the Law Enforcement Assistance Administration.

However, things may be different now. The Privacy Protection Study Commission, in its report due tomorrow or in its follow-up report due in September, will include the results of its investigation of the nation's criminal justice system. Those results will show the FBI and other federal law enforcement agencies are "pretty much unregulated," a source said.

This time, when Congress resumes efforts to draft legislation that would cover how criminal records may be used and how these agencies' activities should be limited to assure individual Constitutional rights, there will be some hard data that didn't exist before, the staffer predicted.

Edwards is also reportedly concerned that many states are influenced by the fact that the FBI message-switching service, like its fingerprint identification service, would be provided to the states as a "free service."

On the other hand, services from the National Law Enforcement Telecommunications System (Nlets), a nonprofit consortium operated by the states, come out of state law enforcement budgets. Certainly, the services provided by the FBI are no more free than those furnished by Nlets — they all come out of tax dollars, although the FBI doesn't like to hear people say that, a source remarked.

In its request for a go-ahead on message switching, the FBI attempted to separate the NCIC's Computerized Criminal History (CCH) records from the stolen property and warrants system and handle the non-CCH aspect first, even though the same technology would allow them to do both.

Some people on Capitol Hill are buying that argument, a source said. Some perceive message switching merely as a service function for state and local law enforcement much like fingerprint identification, and "there's no reason why the FBI or some neutral entity shouldn't have that function."

As the turmoil over message switching was beginning to quiet down, a two-day briefing was hosted by Chairman Edwards to acquaint new House members and staff with the law enforcement and computer jargon that surround the issues of message switching, computerized criminal histories and the like.

Deputy Attorney General Flaherty, in a mood of conciliation, attended the briefing along with representatives of the FBI, Nlets, the Justice Department Telecommunications Committee and representatives of criminal justice systems in California, Illinois and Florida.

Carter Administration Plans Federal DP Revamp

(Continued from Page 1)

quist asked for responses by July 15, "that obviously is not a hard-and-fast deadline," an agency spokesman acknowledged.

To stimulate participation, Granquist included with his letter a list of "previously identified" issues and problems as a guide to what he thinks are the project's basic concerns. But he noted the list "is by no means all-inclusive, so use or ignore [it] as you deem appropriate."

The list was, in fact, so general it suggested to some recipients that OMB has little idea what direction it should follow. Covering some 30 items, the list started with "data processing planning process" and "requirements planning," included "convergence of data processing and telecommunications" and ended with "functional performance specifications policy, Software Exchange Program, etc."

Quick Action Planned

While the study is intended to be broad in scope, it will be structured in a fashion that will permit pieces to be spun off and acted upon throughout the project, Granquist said. Some "high-priority problems, such as computer security policy and improved DP planning," are already being addressed in this way, he added.

As others are identified, "they will be given immediate attention. Throughout this project our goal will be to identify a problem or set of issues and create a task force to address them.

"As soon as each task force presents its recommendations — there will be strict deadlines for all groups — that group will be disbanded and implementation of its recommendations initiated," he continued.

Although the stimulus for setting up the task forces will come from the outside comments, membership of the task forces will be drawn largely from within OMB, the agency spokesman said.

Granquist expects the full study and initial implementation of its recommendations to be complete in 10 to 12 months, but one informed DP professional within the government called that estimate "at least optimistic" if the study's work is to be effective and substantial.

Even though he believes Granquist would be unable to get a lot done in a limited timeframe, the observer feels certain the effort to gain better control over the sprawling federal DP facilities is "a serious one and agencies better be ready for changes."

While the OMB spokesman admitted he had not spoken to Granquist specifically about the timetable, he said he was sure it was the project director's best estimate of the time needed to accomplish the work of the project as he currently envisions it.

Comments about the project can be addressed to Granquist at OMB in the Executive Office Building, Washington, D.C. 20503.

Monitors Check Jet Noise Level

(Continued from Page 1)

sing dogs.

Using the data provided, airport investigators can determine what contribution aircraft are making to the overall noise level in a surrounding area.

The first system was installed in 1973 at the San Diego airport in accordance with a law passed by the state of California requiring noise monitoring at all airports. Airports outside California have installed them on a voluntary basis.

Although a state cannot penalize an airline or individual pilot for exceeding certain state-established noise levels, it can prescribe certain long-range guidelines.

Airports, in turn, are becoming more sensitive to the problem and increasingly have been changing flight plans and landing and take-off procedures to alleviate as much noise as possible.

Monitoring Equipment

The noise monitoring system uses remote microphone installations linked to a Varian Data Machines V71 minicomputer to perform calculations for a noise index. The index is continually being recorded, processed and compared with previous results, according to Varian officials.

The index is used by airport investigators to analyze cost-effectiveness of noise relief programs such as the two-segment landing approach. In this approach, the landing aircraft descends from a six-degree to a three-degree glide instead of a steady three-degree approach, according to a spokesman. In this way, the plane is able to fly higher and more quietly over residential areas near the airport.

The noise monitoring system has proven "very reliable," according to Walter Collins, noise abatement officer for both the Los Angeles and Ontario airports.

Right now, the purpose of the system is not to use it as a tool for change, but only to identify certain levels of noise in order to establish impact areas, he said.

This year, the Los Angeles airport was told it was exceeding the criteria established by state law, so airport officials are trying to find different traffic patterns and other measures to reduce the noise.

However, "solutions are not always reachable economically," Collins said. While demands for noise reduction have increased, the standard of service demanded by the public has not decreased and a compromise can't always be reached, he added.

The noise-monitoring computer distinguishes between aircraft noise and other community noise by means of tracking and screening programs written by the EG&G Hydrospace-Challenger Group of San Diego. The programs take into account such factors as sound duration and the shape of the sound, meaning how it builds up and falls off. It also monitors the route of sound from each remote monitoring substation to the next.

Two separate noise-level tallies are kept by the computer. One is an account of the aircraft average noise level and the other is for the community average noise level, which includes all other noise.

The computer produces the noise-level averages for the community and the aircraft every hour at every site. In addition, daily, weekly and monthly noise-level totals are made. These figures have indicated that evening noise is more noticeable and annoying than noise at any other time. In addition, take-off sounds last longer than the noise from landings.

Individual aircraft can be identified by recordings of the actual noise picked up at a site and run through the system along with the tower-to-aircraft conversations identifying the flight number.

Remote monitoring system (RMS) operators may also listen to specific sites using a separate telephone line.

Fifty-four monitoring systems are used to perform data acquisition and processing, visual and audio display, identification of unusually loud noises from individual aircraft and data printout.

These RMS have weather-proof ceramic microphones mounted on specially designed poles and can communicate with the minicomputer, located at the airport by leased phone lines.

Strike it rich with Roytype's new gold computer ribbons.

When it comes to fill-in letter writing and scanning, Roytype Gold Scanoptik™ computer ribbons can't be beat. Their write is jet black, clear, nonsmearing, character after character.

They'll save you money two ways. First, you'll get up to one million lines per ribbon. Second, the writing quality of Gold Scanoptik ribbons is so good that major utilities and other commercial customers have reported rejection rates as low as ½ of 1%.

Gold Scanoptik ribbons are work savers, too. They incorporate a special cohesive ink formulation that doesn't "dust" on impact. Downtime and maintenance are held to a minimum.

Your Roytype salesman can tell you about Gold Scanoptik or other multipass film ribbons for computers, typewriters and accounting machines. Give him a call or mail the coupon.

For more information contact your Roytype representative, or write J. T. Dessureau, Roytype Division of Litton Industries,

Pacesetter for Europe?

Danes Get Privacy Bills Considered Mild

By G. Russell Pipe
Special to Computerworld

COPENHAGEN, Denmark — The Danish parliament is considering two bills to provide privacy protection for individually identifiable data. These regulations are the most limited privacy measures introduced so far in Europe.

Six years in preparation, one bill covers the private sector and the other, the public sector.

These government-sponsored proposals represent a significant departure from the Swedish, German and other European privacy proposals for a number of reasons.

First, the proposals outline different treatment for government and private industry. Second, the proposed regulatory commission is relatively weak compared with its European counterparts. Third, registration of systems rather than licensing has been proposed — but only in the private sector, and then sparingly for those organizations using personal records for management purposes.

Finally, the right of individuals to access their own files — a key feature of most European privacy measures and a key objective in international efforts to standardize privacy laws — is not a blanket requirement for Denmark's private sector.

Data Registration Board

Under the government-proposed scheme, a seven-member data registration board (DRB) with supporting staff would be created as an autonomous unit within the Ministry of Justice, to be appointed by the Minister.

Privacy rules for public agencies would pertain only to computerized systems and would govern maintenance, access and use of such records.

Under this design, the national government's privacy obligations would be essentially unsupervised except for a review of complaints and disputes by the Minister of Finance.

In the private sector, on the other hand, registration and supervision would be under the DRB's jurisdiction. Here, both computerized and manual files would be covered. However, scientific, statistical and archival data relating to individuals would be exempt.

Sensitive Data

Registration of personal data would not be necessary if it is "natural" or normal to the conduct of an organization's activities. That is, firms may maintain files on employees, clients and other individuals if they are essential to their internal operations and kept within the organization.

But files containing "sensitive" information such as race, religion, politics, sexual practices, health, criminal record, drug or alcoholic treatment must be registered. Personal information to be transferred between separate, unrelated organizations must be reported, and information older than five years may not be linked to other information, unless specifically approved.

No overall security requirements are outlined in either measure.

All data processing service bureaus — large and small — would be required to register with the DRB.

Direct mail services would be restricted to maintaining only the name, address, occupation and basic public record types of information about individuals. Sensitive characteristics would not be permitted to be recorded.

Local governments as well as private organizations would come under the DRB's jurisdiction. In the case of disputed decisions, the Minister of Finance would be empowered to resolve those brought by local governments. However, private organizations would have no appeal.

Board permission would be needed to transfer personal data outside Denmark. Government agencies may be granted one-time or case-by-case permission depending on the purposes to be served, according to the proposal.

Businesses registering their systems to comply with other provisions of the statute would have to ask pemission to export personal data. This would be mandatory for sensitive data or when information is given to third parties.

There may be several reasons why the Danes are approaching privacy with much more reserve than did their Swedish neighbors, not the least of which is lack of public demand for the legislation.

Civil servants here have long enjoyed public confidence and are reluctant to impose rules implying lax procedures may exist. But since private enterprises are much more independent and less subject to regulation than in Sweden, separate public/private approaches were logical.

Because the present government faces a parliament which may seize on issues of cost and is generally antibureauracy, it was felt that an essential minimum, and no more, should be proposed.

Denmark is a member of a score of international organizations which may deal with the harmonization or regulation of privacy/security/data movement issues.

Since Denmark is the only country to belong to all of them, whatever norms are established in Denmark may form the basis for negotiations among other countries.

The fact that Denmark has strayed so far from the scope of regulation in the other European countries in the modest authority invested in its DRB may make harmonizing the laws among the nations a more difficult task, especially for the Council of Europe.

'New Weapon'

STOCKHOLM — "One thousand data processing operators would be enough to close down most trade, industry and government activities in Sweden," the *Dagens Nyheter* (Daily News) of Stockholm declared in banner headlines recently.

There are currently more than 3,000 DP programmers and operating personnel in Sweden, nearly all of whom are members of a single trade union. When a nationwide white-collar strike threatened in April, officials were warned by union representatives: "We are aware of this new weapon against employers."

The fact that most large companies and government agencies have automated major administrative files makes them increasingly dependent on computer personnel, *Dagens Nyheter* reported.

"Even absences over summer holidays could endanger reliable DP," it said.

TP USERS CONVERT TO
Shadow II

If you have an on-line system, and you are using one of the common proprietary TP Monitor packages or alternatively a Home-Grown TP Monitor, you should be looking seriously at SHADOW II.

More than 80 users from this group have already converted their on-line systems to run under the control of SHADOW II, on 370/115's up to 168's and right thru the 360 range.

They have saved big chunks of main memory and CPU time, and significantly improved response times.

Applications Programmers are now between 50% and 1000% more productive, and Systems Programmers can now spend their time on valuable development work, not on system maintenance and tuning functions.

They also receive the industry's finest customer education and support. And they really appreciate the regular improvements and enhancements provided by the largest, most experienced development team in its field.

Seven out of every ten European 360/370 installations who move into TP acquire SHADOW II as their TP monitor.

And not a single SHADOW II user has ever converted to any other TP Monitor.

Altergo has now made a massive investment in its North American operation to ensure that SHADOW II achieves a similar success here.

Already there are delighted users right across the United States who can testify to the benefits offered by SHADOW II compared with other systems.

The best reference is the System itself. Return the coupon right away to receive your copy of the SHADOW II Concepts and Facilities manual and start to discover why SHADOW II has created such a stir in the TP World.

Cbema, ASQC Join Forces Opposing S. 825

By Molly Upton
Of the CW Staff

The Computer and Business Equipment Manufacturers' Association (Cbema) and the American Society for Quality Control (ASQC) have joined the opposition to S. 825, the Voluntary Standards and Accreditation Act of 1977 (see story on Page 9).

Both decry the mandatory aspects of standards which the proposed National Standards Management Board (NSMB) would bring in replacing the voluntary aspects of the American National Standards Institute (Ansi).

The ASQC focused on the overlapping authority between various government agencies and predicted resultant confusion. The two opponents are secretariats of Ansi.

Cbema labeled the bill "premature and unwarranted," contending the "overall voluntary system of this country has operated successfully for over 75 years and is the basis on which the success of our industrial community has been built."

The ASQC claimed the bill would "replace the existing widely accepted Ansi system with an unknown, expensive, untried organization in federal government to perform identical duties."

S. 825 proposes a "confusing overlap of responsibilities" among the Federal Trade Commission, National Bureau of Standards (NBS) and the proposed NSMB, the ASQC noted.

The overlap "portends bureaucratic delay and mismanagement," according to the ASQC, which is a secretariat for Ansi's Z-1 committee on quality assurance.

ASQC's "experience in dealing with various federal agencies and departments would indicate a dismal future for such overlap in responsibility" as outlined in the bill.

In a letter to Sen. Edward M. Kennedy (D-Mass.), chairman of the Antitrust and Monopoly Subcommittee, and to members of the Senate Judiciary Committee, the ASQC outlined the three reasons it opposes the legislation.

"The present voluntary consensus standards system works as a fair and equitable arena for commercial product and service standards," according to the letter. "Any necessary improvements do not warrant and can be made without additional federal legislation."

Although S. 825 borrows many good provisions from the existing standards system, it offers "no new ideas toward the expeditious management of voluntary consensus standards," the ASQC continued.

The bill does offer federal dollars and a commitment to greater government participation — but "at a cost three times the annual budget of the existing private-sector system it would replace."

The association said "the private free enterprise system on which our country was founded will not long support a standards development system in which [the private sector has] practically no role in its rulemaking or management processes."

A better approach to federal involvement in standards is contained in the proposed Office of Management and Budget circular which encourages wide usage of voluntary standards by all federal agencies, the ASQC indicated.

For its part, Cbema observed in a statement that "the test of proper legislation is whether reasonable and enforceable safeguards are introduced in the standards-setting process without imposing excessive federal regulation."

Cbema is the secretariat for Ansi's X3 committee on computers and information processing and X4 committee on office machines and supplies.

"We think that S. 825 fails this test. Any modification of the standards program should ensure that there is no impediment to ingenuity and the development and implementation of new technology for industrial products" and "there is no ban to the free market choice of the consumer for any product."

PROGRAMMERS

WANT TO EARN $35,000 OR MORE PER YEAR?
SELL SOFTWARE- ASI WILL TEACH YOU HOW

THIS MAY BE THE MOST IMPORTANT ADVERTISEMENT YOU HAVE EVER READ

If you have 2—3 years of IMS or TOTAL experience as a data base administrator, data base designer or applications programmer, and have the following characteristics — ASI wants to talk to you. Are you:

- Tired of designing/maintaining the same data base applications over and over?
- Tired of the same old 8:00-5:00 job with limited earning potential?
- Able to present your solutions to technical problems effectively to others in your organization?
- Interested in increasing your take home pay far beyond present levels for your job classification?

If you answered "yes" to the above questions, this may be the opportunity you have been waiting for. Applications Software, Inc. — developers of the ASI-ST Data Management and Reporting System and of ASI/INQUIRY, the IMS Query Language — is expanding its marketing program. Our products are the technological leaders in the proprietary software industry. This fact, plus our expansion plans, has created openings for technically competent people who want to earn in the $35,000 and over range.

If you have this level of technical ability in data base environments, get along well with people, can articulate data base concepts, and above all have a desire to succeed — we'll do the rest. Train you in our products, in sales techniques, provide the office space and sales leads and start you on the road to financial independence.

As Part of NBS

Bill Would Create Federal Standards-Making Institute

By Edith Holmes
Of the CW Staff

WASHINGTON, D.C. – A Senate bill that would create an independent government-financed standards board and a new Institute of Standards and Accreditation in the National Bureau of Standards (NBS) received strong support from the Computer & Communications Industry Association (CCIA) during hearings here recently.

However, equally strong opposition to the Voluntary Standards and Accreditation Act of 1977, S. 825, was lodged by the American National Standards Institute (Ansi).

The lack of computer industry standards costs the taxpayer "hundreds of millions of wasted dollars per year," CCIA President A.G.W. Biddle told the Senate Antitrust and Monopoly Subcommittee, chaired by the bill's author, Sen. James Abourezk (D.-S.Dak.).

Testifying on behalf of Ansi, the organization's executive vice-president, Donald I. Peyton, argued the bill would deprive the American public of the voluntary standards system by nationalizing it.

Ansi views the creation of the National Standards Management Board and the new NBS institute as its obvious replacement as the national standards-setter, Peyton said.

Rather than take the standards efforts in-house, the government should fairly enforce existing laws "which are totally adequate to provide oversight for voluntary activity," Peyton stated. Congress should encourage and support government participation in voluntary standards activities and government use of those voluntary standards which meet its needs, he added.

More FTC Responsibility

Besides establishing a standards board and an accreditation institute, the Abourezk bill would strengthen the Federal Trade Commission's (FTC) responsibility to see that standards are not used as anticompetitive tactics. This would be accomplished by providing a means of appealing FTC decisions where appropriate, a spokesman for the Senate subcommittee explained.

The Secretary of Commerce would be given overall responsibility for standards efforts. Through the proposed NBS institute, the Commerce Department could check out laboratories who come to it and ask to be accredited to test products for consumers and the government.

One of the assumptions of the bill is that testing facilities like Underwriters' Laboratories have become "the tools of the industries," he noted.

The NBS institute could develop standards in the absence of private initiatives, according to S. 825.

The bill further provides for U.S. government participation in international standards efforts.

Change of Heart

Jordan Baruch, assistant secretary for science and technology at the Department of Commerce, appeared briefly before the subcommittee to present executive branch opposition to the bill.

Abourezk, who had been informed by high-level Commerce Department officials that Baruch and the department as a whole supported S. 825, asked Baruch why his stance had changed. Staff members indicated the change was made on orders from the Office of Management and Budget (OMB).

Abourezk, who wanted to know Baruch's personal opinion about the bill, asked that he provide it, and Baruch said he would ask the White House for permission to do so.

Last week a subcommittee staff member indicated Baruch had provided his "qualified" approval of the bill without indicating why OMB had asked that he oppose it.

During the hearings, the CCIA's Biddle explained to subcommittee members that the lack of compatibility between mainframes makes it difficult for users to move easily from one manufacturer's system to another's.

There is no institutional mechanism to encourage voluntary private-sector standards bodies to act in any but their own self-interest, Biddle said, citing Ansi X-3 committee contributions regarding a standard to permit the interconnection of peripheral products to mainframes as an example.

The Computer and Business Equipment Manufacturers Association (Cbema) has served as the secretariat of Ansi X-3 for several years, and IBM is a key Cbema member, Biddle said in explaining the industry leader's potential for influencing any standards-making process.

"A mechanism must be developed and implemented to prioritize the development of those standards that will be most beneficial to users and to the nation," Biddle said. "In our industry we have numerous standards dealing with how a magnetic tape reel should be labeled, or physically specified, as well as standard numerical designations for cities.

"We do not, however, have standard higher level computer languages that permit a program written for one manufacturer's machine to be run without change on another's machine," he said. "Nor do we have standards for the efficient high-speed usage of computer/communication networks or standards for the interconnection of the various units of hardware and software that go together to make a computer system.

The CCIA recommended Congress create a Computer & Communications Standards Board (CCSB), modeled after the Financial Accounting Standards Board (FASB), which would be under the full-time direction and control of a board of directors drawn from both the government and the private sector, including representatives from large and small providers and users.

The CCIA also proposed an addition to S. 825 which would require that standards be developed for the interconnection of devices made by different manufacturers.

When less computer equals more performance, small really is beautiful.

A special report on *Minicomputers and Small Systems* in the August 29th *Computerworld.*

Minis are now functioning at every level of business and industry, and *Computerworld's* August 29th special report, edited by Esther Surden, will focus on several issues that are currently the subject of widespread discussion and debate in the minicomputer field. We'll also cover minicomputer hardware in depth — including microcomputers being used in data processing systems. In all, you'll see a variety of applications stories and tutorials on topics like these:

- Programming languages for small business systems — commentary on languages that have the same name but because of the "improvements" added by competing vendors, may have wide variences in operating efficiency.
- How to evaluate technical evaluations — a look at what benchmark tests and product specifications mean.
- The evaluation and selection process — a case study.
- Minicomputer maintenance — analysis of possible methods (vendor maintenance, independent service organizations, and end user self-support) with an eye to cost savings.
- Minicomputers in distributed processing — stand alone and communicating.
- Using minicomputer equipment — including general purpose minis, small business systems, turnkey systems, miniperipherals and microcomputers.

If you're interested in finding new ways to make data processing more useful and cost effective throughout your organization, you should read our special report in August 29th issue And if you're a mini manufacturer, OEM or systems house who's interested in telling potential customers how your equipment can help them in their jobs — advertise here. Your *Computerworld* salesman can give you complete details. But don't miss the August 12th ad closing date. Call Terry Williams at (617) 965-5800 to reserve space for your ad.

Contu Researcher Asks Help

How Effective Is Your Software Protection?

The National Commission on New Technological Uses of Copyrighted Works (Contu) was established to consider problems related to the reproduction and use of copyrighted works on DP systems, among other things. To do this, it has contracted with various research firms to gather data in specific areas of interest.

One of these firms has turned to Computerworld, *and particularly the software developers or vendors among our readers, for help.*

Harbridge House developed the following questionnaire to accumulate statistics, rather than folklore, on what forms of protection are being used for software and how effective that protection is.

CW has been assured (by Harbridge House) that information provided by readers will be treated as confidential, not going forward in the company's report to Contu nor in a summary report of the results with which the researchers will provide CW.

The completed questionnaire should be sent to Richard I. Miller, Harbridge House, Inc., 11 Arlington St., Boston, Mass. 02116.

Contu Questionnaire

(Please Use 1976 for All "Annually" Based Questions)

1. Name of Company ____________________

Address ____________________

Respondent's Name, Phone No. and Company Position

____

2. Please list the three major services/products provided by your company, indicating also the percent of annual sales each represents.

1. ____________________ % annual sales ________
2. ____________________ % annual sales ________
3. ____________________ % annual sales ________

3. How many employees does your company have? ________

4. What are the total annual sales of your company? $________

5. How much does your company invest annually in software development and research? $________

6. Please indicate below how often during the past year you utilized the following forms of software protection, and indicate how effective you consider them to be. (If you do not know, please indicate with "DK".)

PROTECTION TECHNIQUES	USE Number of Times in the Last Calendar or Fiscal Year: In Business Operations and/or Negotiations	USE Number of Times in the Last Calendar or Fiscal Year: In Legal Action	EFFECTIVENESS Rank order on scale of 0-5*
1. Contract or license backed up by: a. Patent			
b. Copyright			
c. State trade secret law			
d. Release of object program only			
e. None of the above			
2. Requirement for "know-how"			
3. Use of cryptographic protection			
4. Use of other means to limit access to the software program.			

*0 = not effective at all; 5 = completely effective.

7. Please list the proprietary software products you market below and indicate next to each whether there is no significance, some or great significance regarding the importance of legal protection for each of the products.

1. ____________________
2. ____________________
3. ____________________
4. ____________________
5. ____________________
6. ____________________

8. Have you ever rejected or abandoned a marketing program for a proprietary software product because of the inadequacy of legal protection?

Yes ________ No ________

9. Do you know of any situation where software products representing a significant level of innovation are not developed or marketed because of inadequate protection?

Yes ______ No ______ Please Identify ____________________

____

____

____

____

10. Do you contemplate any change in your marketing program because of the Copyright Act of 1976, effective January 1, 1978? Yes ______ No ______

11. How would you change your marketing program if legal protection were otherwise improved for computer software? ____________________

____

____

____

Thank you for your participation.

The Winning Edge...

How to Create a Winning Proposal

A unique step-by-step guide to proposal preparation is providing the winning edge to computer/EDP marketeers in their proposal efforts. *How to Create a Winning Proposal*, an innovative "how to," is so effective it is rapidly becoming the standard text for use in government, commercial and OEM proposal projects. It is currently in use by 74% of the nation's major computer/EDP equipment manufacturers, and 62% of the data base management and service organizations.

The book covers the entire proposal process, giving detailed instructions on contents, structure and methods of preparation for both solicited and unsolicited proposals. Technical, cost and management section checklists are included to ensure the proposal team of covering all the important bases. Excellent guidelines are provided on how to analyze and respond to RFP's, RFQ's and IFB's.

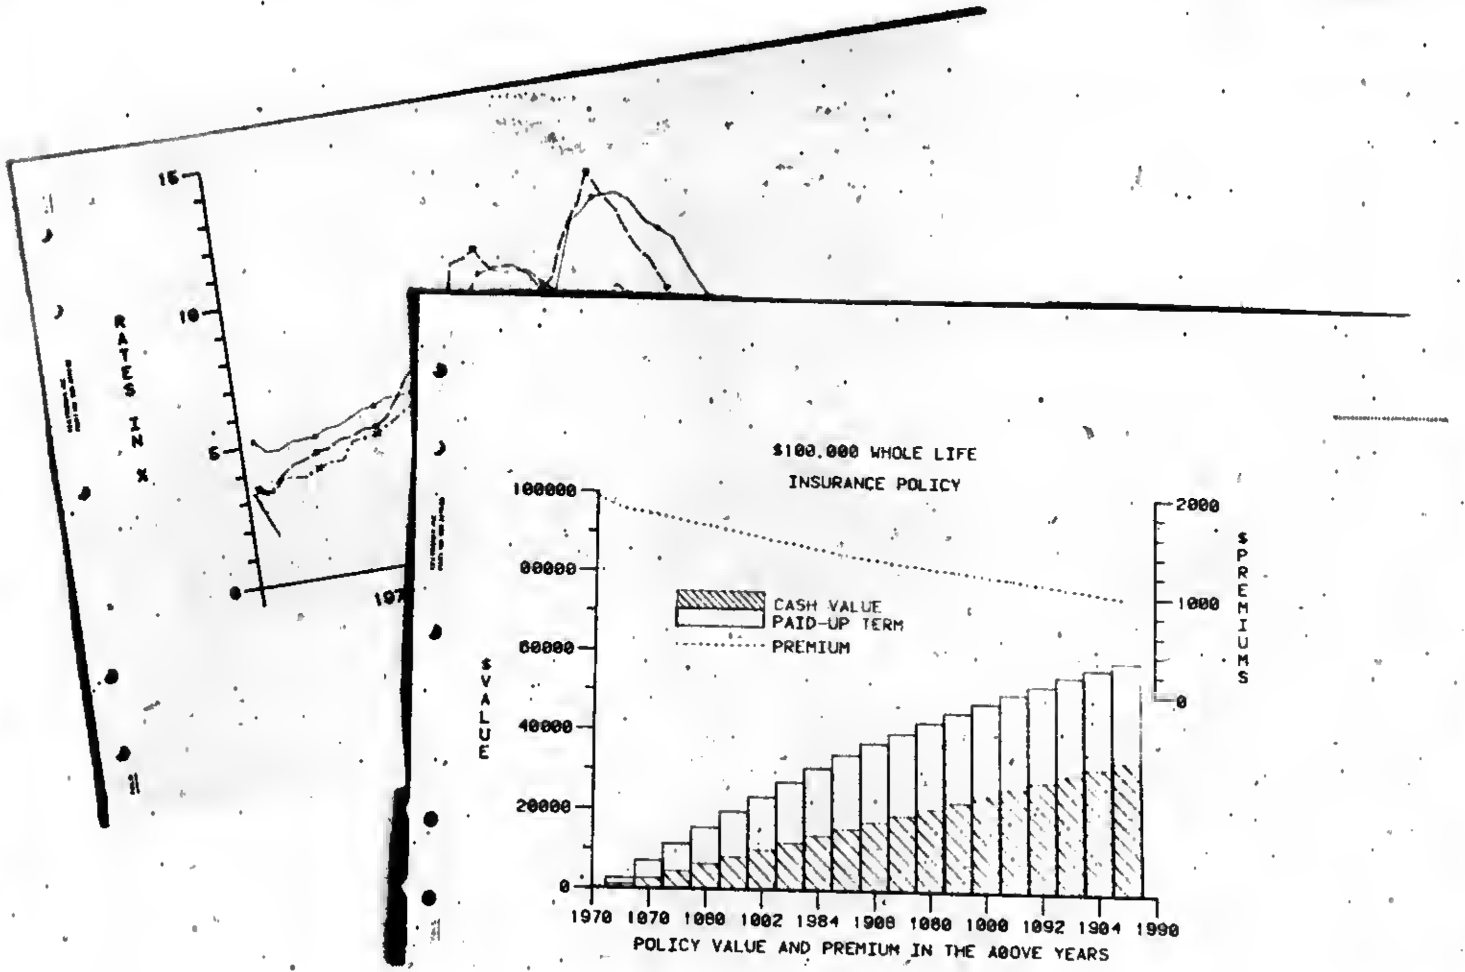
Government requirements are covered in an overview of the US procurement network, how it works, and how the proposing firm can increase its "win probability" in competing for contracts. Other topics covered include:

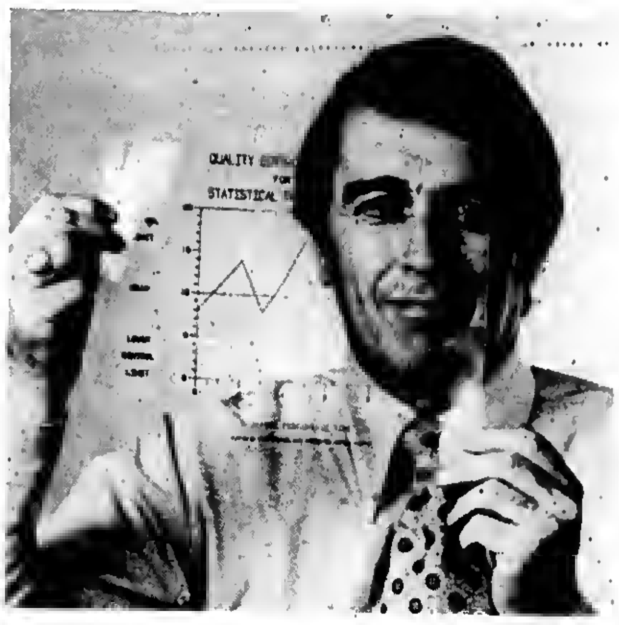
- How to develop an effective "win strategy," mobilize the proposal team, and control the input of the various team members.
- How to organize the proposal contents—what goes where in the management, cost and technical section.
- How to develop task descriptions, manpower estimates, and a work breakdown analysis.

Copies are available pre-paid only from Mercury Communications, Inc. 730-CW Mission, Santa Cruz, CA 95060. $55 includes 3-5 day deliv. inside USA. In Calif. + $3.12 tax.

TEKTRONIX 4662

"There's no plotter like it. My terminal easily commands any graphics."





The 4662 can draw precise plots on mylar or acetate, offering an especially valuable graphic assist to overhead projectors.

Problem: You'd like computer graphics, but not at the price of adding more terminals. So you continue to use paid personnel to hand-plot charts, graphs and diagrams.

Solution: Tektronix 4662 Interactive Digital Plotter. Plugs into most terminals for precise, multi-colored graphics. The 4662 plugs into almost all RS232-C or GPIB-compatible terminals. Use the 4662 to prepare graphics on paper or mylar for sales meetings, program presentations. With computer accuracy and unexpected economy. Plus multiple colors from felt tip or wet ink pens.

Easy interface to timeshare environments. Thanks to its built-in microprocessor, Tektronix modems, and Plot 10 software, operation is simple, accurate, and faster than any other plotter at the 4662's low price.

Don't ask your people to do a plotter's job. Get a graphics specialist that pays for itself. Because the 4662 is from Tektronix, the worldwide graphics leader, you're assured of exceptional reliability and fast service wherever you are. Talk to your local Tektronix Sales Engineer now, or call toll free, (800) 547-1880.

DP Auditing Viewed as Art Form Instead of Science

By Frank Vaughan
Of the CW Staff

HOUSTON – Auditing a DP installation is not a science – it is an art form without a single "correct" plan and is subject to change and imagination, according to William A. Boss, vice-president of marketing support for Pansophic Systems, Inc.

Speaking at the Fifth Annual International Conference of the EDP Auditors Association here recently, Boss said there are six aspects of an installation that an audit must cover: procedures, controls; documentation, functions of the center, programs and data.

"Of primary concern to auditing is the assurance of auditor independence, no matter what type of audit is performed," he said, echoing the concerns of other conference speakers.

This has been a problem in the audit of the DP installation since auditors have been dependent upon the data center personnel to do most of their work because they do not understand the language of the data center personnel or the computer.

"Audit tools must be established for the auditor's use which provide the ability for him to directly interface with the computer easily, quickly, efficiently and independently," Boss said.

The amount of data in a DP installation is enormous, he noted. Before the introduction of the modern computer, data was maintained on pieces of paper in file drawers. Elaborate file structure systems were used to maintain this data in an orderly manner – which were quite easy to audit, he recalled. All the auditor had to do was find the paper and then do what was required.

Today, however, a great majority of the data is stored in computer files, on either magnetic tapes or disks. This creates a problem for the auditor since he cannot read or look at the data stored on computer files. The auditor now must use information retrieval software systems to extract the needed data from the computer files.

Types of Information

There are eight types of information generally required to perform an audit of the data on the computer files. They are:

- Summarization reports, which illustrate on a summary level the data that is maintained.
- Averages, which can illustrate trends.
- Selected reporting, which provides the auditor with only a selected portion of the data on a file.
- Confirmation notices, which are usually a part of accounts receivable or payable.
- Address or mailing labels, required so special mailings can be accomplished.
- Aging reports, for accounts receivable and for accounts payable in bad times, which are useful in determining delinquent accounts and customer paying trends.
- Stratification analyses, which allow an auditor to review data on a file from a stratified viewpoint.
- Balance analyses, somewhat like the stratification analyses, but which also include the cumulative percentage and a visual presentation of the stratification.

Exception Reporting

Exception reporting is a very necessary function for the auditor, Boss stated. Too often files contain bad data, duplicate data or missing data and the computer system or company is not aware of it until it is too late.

As a result, time is lost because of unnecessary reruns of the program once the file is corrected, or, even worse, reporting of critical data is invalid, he observed.

An audit should not only examine the data, but should verify the data on the files, he said. Invalid data and bad codes fall into many categories.

Points that should be examined should include some of the following questions: Are the codes proper? Are the dates on the file really in the calendar? Are amounts or quantities on the file reasonable? Is there duplicate or missing data?

"When I state that large differences in files should be checked, I mean two things. One is that certain items must have certain values, such as the hourly wage," he said. But he emphasized the need to note differences in figures over time. For example, wide variations in payroll or inventory figures should be questioned by the auditor, he said.

Software Could Ease Use of Lab Animals

ROCHESTER, N.Y. – A computer program designed to do initial toxicity screening on chemicals may reduce the need for costly experiments on laboratory animals.

Developed by Genesee Computer Center here, the program could be used as a first step in the testing process, according to the firm.

Relying solely on laboratory testing is a longer and more costly method, according to David Pixley, vice-president of Genesee. The Toxicity Prediction System screens out which compounds are most likely to be toxic, he explained.

"There is a much better likelihood of success if you do this before going to animal testing," he added. Many compounds can be eliminated in this way before investing in animal research.

Currently able to run on a Control Data Corp. 6000 or a Cyber system, the software is being tested at various locations but has not yet gone into full-scale usage, he said.

Primarily devised for testing new products before they are introduced to the consumer market, the program has accurately forecast toxic substances 95% of the time, Pixley said.

The data base consists of a combination of statistical patterns, chemical compound structures and known testing data, he said. In order to approve a different compound, statistical pattern recognition techniques are used to determine the toxicity, if any, of the new compound.

The program can produce an estimation of the amount needed for the tested compound to prove toxic to white rats, Pixley said. It is able to eliminate a number of compounds so that the animal testing can be more concentrated, he added.

The program should only be used as a first step before laboratory testing since the forecast is based on "a probability rather than an absolute," Pixley noted.

Nobody turns COM data into sound business decisions the way 3M can.

Only 3M Beta System offers programmable COM with the big plus of business graphics – to make your COM output more useful to your company's decision makers!

With 3M Beta COM, you make data easier to interpret, decisions easier to make in either of two ways:

Highlight the data. The 3M Beta System gives you underlines, italics, bold face, 8 different character sizes through simple operator-entered instructions. No host computer modification needed!

Graph the data. Reduce complicated numbers to easy-to-scan pie charts, graphs, tables. The 3M Beta System includes the software needed for graphic presentation of data.

But making business decisions easier is only the first step. Beta System makes your job easier, too. From software innovations to installation and operator training programs to field and home base service nobody offers you the unique total system support approach 3M can.

So whether you're interested in business graphics or want to move up to programmable COM, move COM in-house or expand your operation, let 3M show you the way. Call your local 3M Business Products Center or write Microfilm Products Division, 3M Company, St. Paul, MN 55101.

BETA Systems

For entry-level COM, let 3M show you "LBR" – the only **totally dry COM** and the most convenient way to record computer data on 105mm microfiche.

Better microfilm systems start here... 3M COMPANY

Independence Lost During '60s

Audit Computers Seen 'Freeing' Auditors in Future

By Frank Vaughan
Of the CW Staff

HOUSTON — The most significant factor affecting auditors today is their loss of independence during the 1960s, according to Donn Parker, senior research analyst at Stanford Research Institute (SRI). Parker told an audience of 500 at the 5th Annual International Conference of the EDP Auditors Association here recently that auditors can look forward to regaining this independence as time progresses.

"During the 1980s, DP auditors will disappear — at least in name," he predicted. All auditors will be DP auditors and the title will revert to its generic name.

Parker sees the emergence of an audit computer, a prediction that was echoed by other speakers during the three-day conference. This individual computer for audit organizations will be a major factor in regaining independence for auditors.

Calling for a show of hands, Parker noted that less than 10 of the assembled auditors currently had their own audit computer and speculated that it might be interesting to ask the same question next year when the auditors meet in Dearborn, Mich.

DP auditing has not been keeping pace with the needs of the industry during the 1970s, he said. Part of this has been caused by the resistance of traditional auditors, yet this resistance diminishes yearly, he noted.

A second cause Parker cited was that management has not recognized the need for DP auditors until recently. Justifying this contention, Parker showed the results of a survey taken by SRI in which fully one-third of all organizations queried stated there was no benefit to a DP audit.

A third cause of the professional's inability to keep pace has been that the skills and capabilities are only in the formative stages. This, he sid, is being remedied and soon will no longer be a problem.

Switching to the area of DP crime, Parker suggested that the DP community is always going to have crime with it. Although the crimes are going to remain the same — fraud, theft, larceny, embezzlement, espionage, sabotage, conspiracy and extortion — the nature of the crimes will change, he predicted.

"We are now talking about automated crime and our notion on the concepts of crime is changing," he said.

Future DP crimes will encompass many different areas, he said, including massive frauds, organized crime, coercion of technologists, injury to people and malpractice. Additional crimes will include violation of privacy, wire tapping, violation of intellectual property, computer ouput hoaxes, time accelerated frauds and geographic independent frauds.

And even murder by computer is not to be disregarded, he said. SRI already has a case in its files in which a person was murdered by a process control computer. Of course, it happened on the television series "Barnaby Jones," but the concept is there just the same, he cautioned.

DDP Observers Find Decentralization Not Just Passing Fad

PHILADELPHIA — Although some observers of the trend towards distributed processing have said it is just another manifestation of the craze of decentralization that hits DP every nine years or so, members of a panel at a recent conference here disagreed.

"Once users have the power within their own organization it is very difficult to go back to a centralized system," Frank Finch, manager of on-line systems at E.B. Squibb, said. Squibb originally was centralized and then became decentralized. Another swing of time brought an effort to recentralize, he said, but "now it's very convenient to have the best of both worlds."

"I see several conflicting trends," Steve Heffner, an independent consultant, told the group. "I am around systems that are both centralized and decentralized in the same organization," he said. The economics of centralization are changing, he indicated, and "the productivity of personnel associated with a centralized system drops," he continued.

On the other hand, decentralization provides the problem of duplication, but "I think the sophistication of software and radical drop in the cost of hardware will swing the pendulum toward decentralization," he concluded.

The Penn Central Railroad, now organized as Conrail, began in a decentralized state with about 28 computers, according to Bud Bocher, manager of information services for the marketing department at Conrail. Conrail became centralized at one point, but "we are now working back towards minis," he noted.

"The only reason decentralization has come about is that centralization is no longer economical, George Trimble, president of T-Logic, Inc. said. Trimble predicted the day of the large single mainframe is over and there will not only be a decentralization of hardware but of applications as well.

Technalysis Now Acting As DP Security Consultant

SOUTHFIELD, Mich. — The Technalysis Corp. has recently expanded its computer technical services to include computer security services and computer crime investigation consulting.

These services include disaster planning, computer security site surveys, security management consulting, communications security, computer crime investigation consulting and computer security/crime investigation educational workshops.

Technalysis maintains a systems software and applictions development staff with experience in the design, development and implementation of systems for both computer systems manufacturers and their industrywide users.

Technalysis' corporate offices are located in Minneapolis, with additional offices in the Washington, D.C., area and at 20100 Civic Center Drive, Southfield, Mich. 48076.

The 50 Million Dollar Award . . .
ICP's highest volume recognition . . .
awarded exclusively to
Cincom's TOTAL DBMS.

The Software Honor Roll . . .
Datapro's certification of quality . .
user surveys made TOTAL the
only DBMS 3-time recipient.

Quantity. Quality.
More evidence of TOTAL acceptance.

So often in life, one must choose between quantity and quality. User success with the *TOTAL Data Base Management System* proves that *both* benefits accrue to the organization who selects TOTAL as the foundation for its information system requirements.

Nearly *2000 installations worldwide* . . . from efficient minis to the largest maxis . . . have demonstrated that the capabilities, ease of use, and power of the TOTAL DBMS can be applied successfully to nearly any operating environment. Inputs, feedback, and suggestions from this large and diverse user base insure an *exceptionally stable product* . . . so important in the world of data base processing . . . and a continuous *emphasis on product enhancements*. This is what makes quantity and volume as represented by the ICP 50 Million Dollar Award meaningful.

With nearly *four times* the number of user reports submitted than the next leading DBMS product, TOTAL received high marks for *overall satisfaction* . . . recording a rating of *3.5* on a scale of 4.0 . . . in the Datapro Research survey. Other major factors in this independent survey include throughput/efficiency, ease of installation/use, documentation, and vendor training/technical support. Such user recognition brought TOTAL its *third Honor Roll award* . . . *unique* among DBMS. Quality and consistency are what makes this tribute meaningful.

If you are planning your organization's move into data base, and, if quantity acceptance coupled with consistent quality are most important to you, why not contact your local Cincom Systems representative today?

Cuts Transcript Delivery Time

DP-Aided Court Reporting Can Speed Appeals: LEAA

By Edith Holmes
Of the CW Staff

WASHINGTON, D.C. — Computer-aided court reporting can reduce by half the time it takes to obtain court transcripts and so speed the appeals process, according to a study released here recently by the Justice Department's Law Enforcement Assistance Administration (LEAA).

Financed by a $230,000 LEAA grant to the National Center for State Courts, the 20-month study focused on the Philadelphia Court of Common Pleas. In that court, automated reporting reduced delivery of a transcript from an average of 37 days to 18 days.

The Philadelphia court found computer-aided transcription (CAT) sufficiently successful that when funding for the 14-month demonstration program ceased, the project was continued.

But while CAT can be commercially feasible, its implementation can also be "a formidable task," according to the study, entitled "Users Guidebook to Computer-Aided Transcription." It was written for the National Center for State Courts by J. Michael Greenwood and Jerry R. Tollar.

Several other courts have tried CAT and their success varied in accordance with preparation, design, selection, installation and operations management, the study said.

Improving Stenotype Method

A multistage, labor-intensive process, the stenotype method is the predominant technique used to record and transcribe court proceedings. CAT "is a technological approach to improving and expediting the stenotype method by reducing the reporter's involvement in the burdensome transcript preparation process," the study stated.

Courtroom testimony is recorded on a modified stenotype device that produces paper notes but which also records the reporter's keystrokes on cartridges or cassettes that can be ready by I/O devices, the authors explained.

An IBM 370/145 running under DOS makes a first translation of the electronically recorded stenotype notes into "reasonably accurate English prose."

This translation is conveyed either on magnetic tape or through a telecommunications system to a text-editing subsystem consisting of a minicomputer, a CRT for editing by the court reporters, a dual disk system for storage and a cartridge/cassette reader, the study reported.

The text editing corrects any errors in the format or text of the transcript produced in the translation by the mainframe. The printer produces the final official transcript once text editing is completed, the guidebook said.

Philadelphia's text-editing subsystem consists of a Data General Nova 1200 mini with 24K core storage; Diablo 2.4 M-byte dual storage disks, an Iomec 312 input cartridge reader and two Beehive Superbee CRTs.

A Dataproducts 2310 line printer and an off-line decollator and burster complete the court's CAT configuration.

In making their study, Greenwood and Tollar examined the CAT implementation in the large-scale Philadelphia court operation. They also monitored the progress of CAT instituted or demonstrated in courts in Baton Rouge, La.; Cincinnati, Ohio; Dallas; Detroit; Tucson, Ariz.; and 20 locations of the U.S. federal district courts.

Finally, the study's authors evaluated commercially available CAT systems for the courts by establishing production standards and assessing CAT vendor capabilities. The conclusions they reached concerning the four vendors in this field (Baron Data Systems; Stenocomp, Inc.; Stenographic Computer Systems and Stentran Systems) are included.

In analyzing the Philadelphia CAT project, the researchers looked at the number of days needed to prepare a record of court proceedings using CAT, the total cost per page related to the transcript's preparation and the percentage of time the court reporters were involved in the transcription process.

Economically Competitive

When developed with proper management controls, CAT is economically competitive with traditional transcription methods. In 1976, the actual transcription cost in various courts ranged from 70 cents to $1.75 per page. These costs are significantly down from the $1.50 to $2.25 per page estimates made in 1974.

CAT does permit better utilization of court reporters, both for recording courtroom testimony and for preparing official transcripts, according to the study. But of all official court reporters, only 40% to 60% are sufficiently accurate and consistent in their notetaking to permit cost-effective computer transcription of their notes without extensive editing.

The study recommended that courts experimenting with CAT should select reporters who are accurate enough for the mainframe to produce a first-run translation that is 95% accurate and who can edit text on a CRT at the rate of 25 pages per hour.

In the future, more stand-alone CAT systems, consisting of a single minicomputer capable of totally producing CAT, including translation, text-editing and printing operations, will be developed, the study stated.

Copies of "Users' Guidebook to Computer-Aided Transcription" can be obtained by writing: National Center for State Courts, 1660 Lincoln St., Suite 200, Denver, Colo. 80202.

94% DISCOUNT
IN QUANTITIES OF ONE

Why spend $150,000 or more for a firmware system when our's can give you the same End results for less than $300/mo. (60/mo lease plan). Remember us! We're that "FREE SOFTWARE" company that provides you with thousands of dollars of software for just a little more than the cost of the paper its' printed on. NOW we are going to virtually give away our "Firmware System" at mere fractions of everyone else's prices. How can we do it? Well — Just like we did with our software; by providing a quality product at very nominal prices and relying on volume for our profit instead of making it off you! Unlike some of the other advertised systems we offer a TOTAL system package with mass memory, video display, line printer, operating system, plus a full Application Software Library. Software packages available with the system include: Payroll, Inventory, General Ledger, Medical Record Keeping, Word Processing and more. Entire package includes everything above plus system tutorial, more than 600K Bytes of formatted disk storage and over 65K Bytes of RAM. Assembled and ready to use. Complete Unit price $8999 plus shipping. Leasing plans and national service available from any of our 134 dealers.

Chicago's Poor Get DP Courses

By Catherine Arnst
Of the CW Staff

CHICAGO — The Chicago Urban League has started a computer training program for poor persons with help from both private industry and the government.

The program trains students at the "dirt cheap" price of $85 per pupil per year with the aid of extensive private donations, Darrell Perrish-Johnson, director of the computer training school, said.

The school, which opened April 4, currently has 59 students (one dropped out) in three courses and plans to train 721 over the next four years. Currently, there are three areas of training: operations, programming and data entry.

The programming course lasts 12 weeks, the operating course, nine and data entry, eight weeks. The first two require high school or equivalent education, while data entry requires an eighth grade reading level, Perrish-Johnson said.

The students are selected from the state's Comprehensive Employment and Training Act (Ceta) program and are basically low-skilled people who need training to be employed, she said.

There are 31 males and 28 females, and the ages range from 18 to 43, with most of the students in their mid-20s. Race is not a consideration, she added.

Three of the students have college degrees, 24 have some college education and five do not have high school diplomas, she said.

Planned Since '71

The school had been on the drawing boards since 1971. It was started with donations of $96,000 from Chicago businesses.

In addition, IBM donated a 370/135, four 3742 dual data stations and four people to manage and teach at the school.

Montgomery Ward donated 6,710 square feet of downtown office space rent-free and with utilities paid, according to Perrish-Johnson, who added that some say the firm is competing with Sears Roebuck, which has sponsored similar programs.

Without these donations, the school could not have opened, she said.

The state reimburses the Urban League, a nonprofit organization, for all the school's operating expenses, and the Ceta program pays students $2.30/hour to attend classes. The classes run eight hours a day, five days a week, and students are not allowed to have another job while in the program.

ON ANY TRACK
WE'RE HARD TO
BEAT

When you talk about leasing an IBM/370, you are on a fast track. Each leasing company claims it has the best program for you. But does it? With over $200 Million of IBM/370 equipment on lease in the U.S. and overseas, Alanthus' customers are saving more than $17 Million annually. That's a real winner!

Our leases are unmatched in flexibility. We can offer you a short operating lease, a long term financial lease, or even a revolving lease. Working with you, we can custom tailor the lease program to suit your needs. You win again!

But here's one to get you first past the post. Alanthus is offering to installed 370/158 and 370/168 users, operating leases of 1, 2, 3, and 4 year terms.

Our lease documentation is easily read and understood. It consists of only four pages plus an equipment schedule. Another winner!

Call the people from Alanthus.
We have the lease program that's best for you.
We're winners on any track.

Cost Accounting Method Seen Important to Operations

By Ronald A. Frank
Of the CW Staff

DALLAS — A DP center's cost accounting method provides information to management that can be significant for business operations, according to speakers at a recent conference session here on guidelines for cost accounting practices.

The collection of cost data means it is usually necessary to set up functional cost centers within a company, Norman Statland, of Price Waterhouse & Co., said. In a typical company, this can range from three to 20 or more centers, depending on the size of the firm.

In order to determine where the centers are to be located, it is normally best to use the hierarchy of the organization, thereby establishing the centers according to their functional activity and their relative importance to the firm, Statland said.

One of the benefits of establishing a charge-back system for user departments is that it separates jobs with "real needs" from those which have a lesser priority, he noted.

"If costs can be measured and work effort measured, then rates can be established for charge-back procedures," Statland said. If work effort can't be measured, then the task is probably an overhead function.

The type of costs that should be folded into a charge-back system for user departments include salaries, occupancy costs, equipment charges, supplies and communications costs. Cost structures will fall into either the direct or associated cost category.

The prime reason for establishing a charge-back system is to foster systems planning within a company, according to John Dratch of the J.C. Penney Co.

Most managers react to measurement against expected budgetary performance. In this regard, the creation of a charge-back system requires budget projections of user department needs, he said.

This in turn leads to establishing a user rate based on the department's DP requirements, Dratch explained. Often management can use a predetermined rate to measure the efficiency of a DP center.

'Potential Trap'

Statland disagreed with this concept, pointing out that it could be a "potential trap." He said that if a DP center were operating at 70% capacity as a normal parameter, any major fluctuations in operating patterns would raise questions from management.

Questioned on whether and when jobs should be farmed out to noncompany sources, Dratch said he believed the DP department should make these decisions based on available budgets and in-house expertise.

The panel agreed that the next step after the implementation of a charge-back system would be initiating a transaction costing scheme.

Firms will be going to a transaction pricing system in the future, but this will be accomplished only when a company has a good idea of what its DP costs are.

Although no "hard and fast rules" exist for charge-back systems, according to Statland, a key to making the process work is to tie budgetary guidelines to the charge-back rates.

In many firms, the establishment of a charge-back system is very beneficial because often "they don't know what their costs are," he said.

Public TV Station Borrows Mini, CRTs For Annual Auction

NEW YORK — Lucky bidders at WNET Channel 13's recent third annual auction recently were greeted by customer service volunteers at CRT workstations when they picked up their booty.

The CRTs were linked to an ICL, Inc. 2903 minicomputer on loan to the public T.V. station from the vendor, according to Frank Bonanno, director of DP.

"Usually we ask for all sorts of support services from the community and we asked ICL if it would lend us a system," Bonanno said. The station has an ICL minicomputer of its own, he added.

The system has been credited with reducing the start-up time of the auction significantly and simplifying the handling of the more than 10,000 items that were auctioned since June 3.

Starting in mid-April, the system was fed information through ICL Direct Data Entry (DDE) devices about each donated item, including its name, its identification number, a description and the name of the donor.

After the initial inventory was created, 14 CRT units were positioned both at the auction site and at the warehouse receiving area. The two CRTs at the warehouse were used to check the items upon delivery and to code each item for its location.

Five of the consoles were used to enter winning bidder information, including names, phone numbers, amounts of bids and dates of pickup.

Another several CRTs were in the reception area to validate winning bidders. After they were validated, the method of payment was entered into the system and the necessary receipts were obtained to release the item and complete the cycle, he added.

For the last two years the station used its IBM System 3, which it has since replaced, to update the auction information and print reports. "A lot of paperwork was required at the auction," Bonanno said, and the elimination of this paperwork by using the ICL system will reap considerable time and handling benefits.

The totally dedicated system ran ICL's Transaction Processing System. A consultant from the vendor came from England to help the station with this particular software.

The only thing that could have gone wrong is "the people factor," Bonanno said. Most of the people handling the CRTs were volunteers who may not have been familiar with the way terminals work. However staff was on hand to handle any problems, he said, and the auction ran smoothly.

The station's loaned system had 40K words of memory, two 60M-byte disk drives, two DDE devices, a 600 line/min printer and 14 displays.

WNET's own ICL system, which is used to keep track of membership or station backers and general business applications, has a 40K word CPU, console with keyboard, three 60M-byte disks, one 10M-byte fixed disk, a 300 line/min card reader, a 1,500 line/min printer, four DDE stations and several CRTs.

HAVE YOU BEEN TO A JAMES MARTIN SEMINAR YET?

"Much of the future of computing will be distributed processing."

"There is a right way and a wrong way to structure data logically. Most designers are doing it wrong today and this will incur great future costs. This seminar will teach how to do it the right way."

"We are seeing the beginning of a revolution of rising expectation from the end users. This will be the D.P. Managers biggest problem."

"The gap in dollars between a good design and a poor design is growing wider with each new technological advance."

THE JAMES MARTIN WORLD SEMINAR

The outstanding computer education event of the decade

ON THE DESIGN, MANAGEMENT AND FUTURE OF DISTRIBUTED PROCESSING, DATA BASE, TELEPROCESSING AND NETWORK SYSTEMS

12 - 16 SEPT	JOHANNESBURG	CARLTON HOTEL
26 - 30 SEPT	LONDON	EUROPA HOTEL
10 - 14 OCT	PARIS	NIKKO HOTEL
31 OCT - 4 NOV	CHICAGO	ARLINGTON PARK HILTON
7 - 11 NOV	BOSTON	PARKER HOUSE
14 - 18 NOV	LOS ANGELES	MIRAMAR, SANTA MONICA

James Martin is the author of the most comprehensive series of textbooks on data processing and telecommunications. The James Martin Seminar is rated "THE BEST COURSE OF ITS KIND IN THE WORLD". Martin has an outstanding ability to explain the most complex issues simply. This seminar will provide you with a unique opportunity to learn and appreciate the significance of the latest technology trends and design methods. With the development of distributed processing and the LSI based microcomputers, these opportunities are now wide open and are no longer just for the giant multi-national corporations.

These seminars are part of the 1977 James Martin World Tour Programme including:
SAN FRANCISCO HOUSTON AMSTERDAM TORONTO TOKYO MELBOURNE SINGAPORE
JOHANNESBURG LONDON PARIS CHICAGO BOSTON LOS ANGELES

The Waves of Change

By Charles P. Lecht

Whither virtual? Lecht believes 'virtual storage, virtual processors, virtual I/O concepts and virtual terminals will create the framework for achieving the critical ease-of-use objectives' of the next generation. That generation is already on its way in the form of such 'bridging devices' as the IBM 3033.

CHAPTER VIII
(Continued)

When virtual storage (actually a design compromise) was first developed in 1956 (through the University of Manchester's Atlas computer project), the primary objective was to overcome the high cost of real main memory. In the mid-1970s, semiconductor main memory has become relatively inexpensive, with prices dropping steadily.

Is the virtual storage technique really necessary later in this decade?

From the cost-of-memory point of view, the answer is still yes. Moreover, as a programming aid, virtual storage and virtual machine techniques are very important. Although MOS storage will continue to decrease in cost, users will never satisfy their appetite for more and more on-line storage.

The IBM 370 virtual storage implementation is crude in that all I/O operations (Channel Control Words [CCW] and buffer areas) are translated from virtual to real to virtual by software (no I/O DAT, or Dynamic Address Translation, hardware feature exists). This causes on average about 15% CPU overhead. Actual overhead depends on the number of CCWs, among other factors.

In contrast, the Fujitsu M-190 design, which is 370-compatible, has already implemented an "I/O DAT box."

Virtual Machine/370 is the eighth operating system within the 370 series. This is a technique which allows the system to control multiple "virtual machines," each with its own user operating system.

The VM/370 operating system (with microcode assist features) is the foundation upon which IBM will build a massive programming aid capability. A virtual machine concept permits several users to utilize a subset of hardware resources with total separation and protection (while the resources appear to each user to be unshared with anyone else).

With VM/370, the programmer assumes the memory and other resources to be practically limitless (16M bytes per user, maximum). As such, large complex programs can be written more quickly. System/80 will create the basic architectural foundation for the new application development environment and for later improvements in software, microcode and hardware technology.

Virtual techniques will also enable IBM and other innovative DP manufacturers to construct information security systems. Privacy of data will be a vital part of the system. For example, control of fetch commands is an inherent part of VS. Critical data will be fetched only when proper authorization is included in the command.

In remotely or locally distributed systems, certain processes and data will simply be unavailable to some users.

'New and Better Tools'

Virtual storage, virtual processors, virtual I/O concepts and virtual terminals will create the framework for achieving the critical ease-of-use objectives.

In addition to the programmer aids mentioned above, system software should also contain improved debugging tools. Very importantly, system changes should be nearly transparent to the user (system resources should be accessed "logically," not physically) so that previously checked-out programs will be unaffected by hardware configuration changes (except, of course, in terms of performance or response time). This concept is extremely important in that it simplifies upgrading, or migration to new hardware.

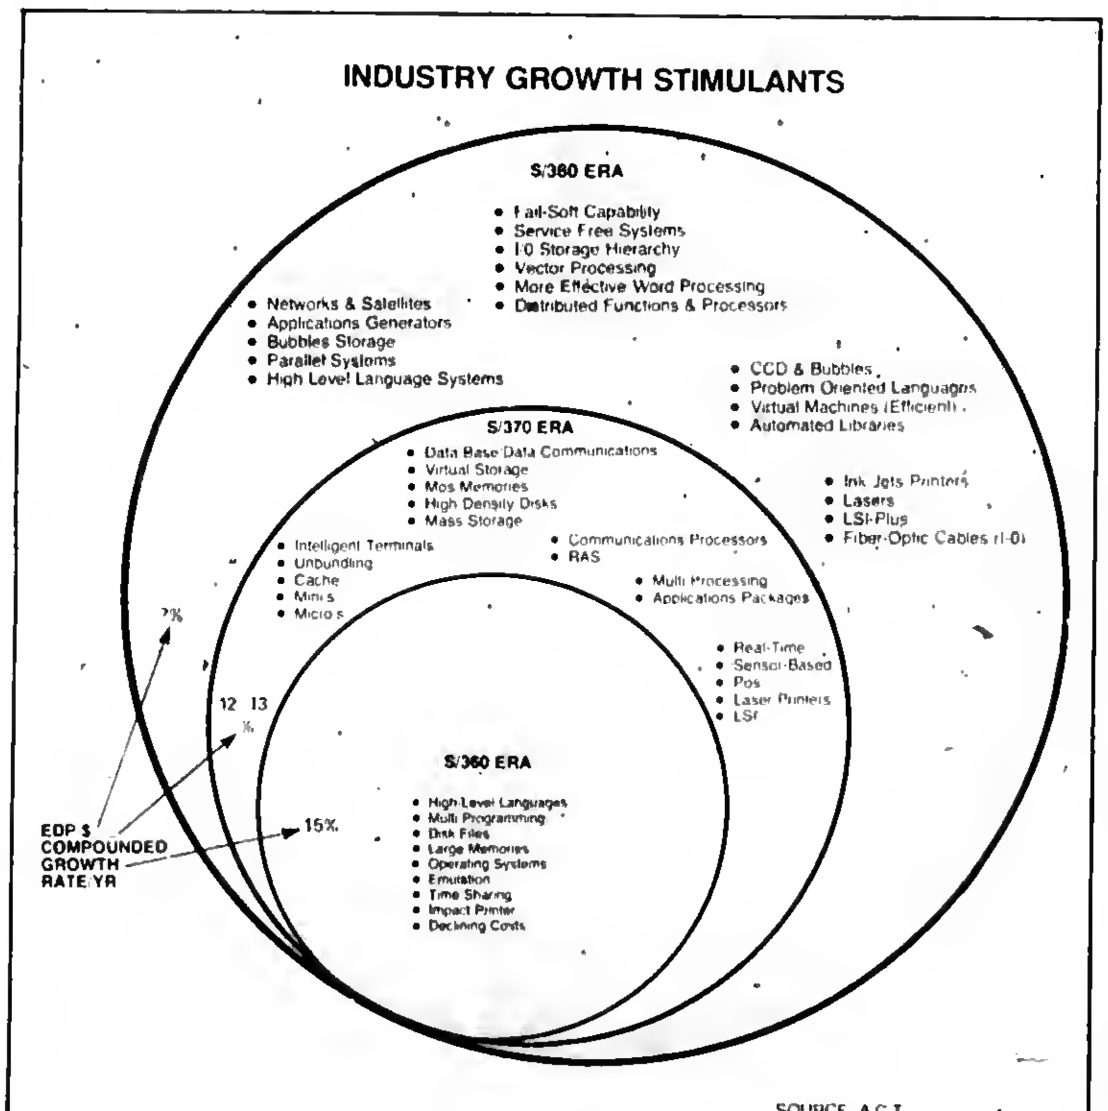

Figure VIII-6

Accurate predictions of performance of a given configuration in a given environment must be possible. With this in mind, installation managers will be given new and better tools for evaluation purposes, to assist them in optimizing the total system design.

System profiles, component performance and batch/real-time processing efficiency will all be measured with appropriate new techniques. Use of these methods will even permit the measurement of the impact of one operating environment on another, when both utilize and share the critical resources.

After a system is installed, it should have the ability to monitor its own performance. Workload status as well as hardware utilization information can all be displayed. The total system should remain responsive to changes in conditions, automatically and at all times.

The system of the next decade must minimize the need for human intervention and dynamically allocate resources and schedule workloads so that throughput and response time requirements are satisfied. Automatic error correction, retry techniques and on-line failure analysis must be available.

On-line systems of the 1980s will rarely shut down. Continuous processing results in more work output per dollar of investment in the system or network. IBM discussed this "service-free system" (SFS) in the Management Review Committee minutes of April 19, 1971.

Business Considerations

IBM cannot obsolete the 370 series with System/80 on a price/performance basis *alone*. Leasing companies, together with independent, plug-compatible manufacturers (PCM), will find many ways to enhance and extend the life of their vast inventory of used 370s (as they did in the past with 360s).

Newer peripherals, higher density memories and similar embellishments, together with greater discounting, will all inject new life into the "old" partly or fully depreciated 370 systems. Transaction pricing may be just around the corner.

IBM is well aware of this problem and System/80 must, therefore, obsolete the 370 on a functional and reliability basis, clearly demonstrating "ease of usage" or "people productivity" benefits which more than compensate for reduced prices of "old" 370s from third parties. Obviously, greater "raw" performance/price will also be expected by then.

According to IBM, recent studies of the DP budget have shown "that a larger and larger portion is comprised of *personnel cost*, as hardware price/performance continues to improve, decreasing the hardware portion." A 1970 study stated that "the personnel portion was 53% of the budget compared with 35% for hardware and 12% other."

In 1973, IBM found that *application maintenance* absorbed 42% of the people costs while only 52% was allocated to "new application development."

Other surveys, conducted by IBM in 1971, attempted to break down the programmer/analyst time devoted to conversion efforts, maintenance and new development. These results showed that, on average, 17% of the application programmer's or analyst's time is devoted to conversion, 35% is spent on program maintenance and 46% on new application development.

Obviously, maintenance continues to grow as more applications are completed, and it is projected to absorb the lion's share of the user's resources by the latter part of the '70s.

A prime objective of System/80 and comparable systems offered by other vendors, therefore, is to use new hardware and software techniques to increase programmer and end-user productivity in the application maintenance and development areas. One way to achieve this result is to reduce the user dependency on DP "specialists" (analysts, programmers, etc.).

Without these productivity improvements, the user would *not* be able to absorb the increased raw computer performance, and the marketplace would ultimately stagnate.

The 'Bridging' Strategy

During the interim period, prior to System/80, IBM is concentrating on data communications and networks (e.g., recent developments including SNA, SDLC, 3790, 3600, 3650, 3767, 3770, Vtam and NCP) and data management (e.g., 3850, IMS/VS and Vsam). In other words, it is focusing its attention on the "bridging" devices (peripherals, software) and "appliances" (terminals).

I suggest the reasons for this are as follows:

1. Mainframe purchase activity (e.g., 158 and 168) should decrease substantially in 1977-78, and IBM must attempt to fill this potential "revenue gap" with other products (although the anticipated 3032 and announced 3033 processors would tend to offset this potential revenue shortfall).

2. The corporation must get the "appliances" installed before it announces the new System/80 "dynamo"; otherwise, most users will *not* be able to absorb the significantly greater power of System/80 and the market will stagnate (a similar situation arose at the beginning of the 370 era in 1970-71).

3. In order to convert 370 customers over to System/80 as painlessly as possible, it must start a "preconversion" activity *now* (SNA, SDLC, Vtam, NCP and Vsam are some of the key software/firmware "bridging" vehicles).

The end result (if the strategy is successful) is that many of the remote (external to mainframe) terminal devices will be in place; the important data comunications networks and data management functions will already have been converted and remain essentially compatible with System/80 in advance of the "dynamo" announce-

(Continued on Page 17)

RATE OF INCREASE IN MIPS/$

System Series	First Shipped	MIPS/$	Elapsed Period
Early 360s	1965	1:1	
Original 370s	1971-72	2:1	6-7 Years vs. 380 Series
Enhanced 370s	1978-77	3.5-4:1	4-5 Years vs. 360 Series
3033 (3032 & 3031)	1978-79	8:1	2-3 Years vs. 360 Series
System/80	1980-81	16:1	2 Years (Our Forecast)

Figure Vttt-7

IBM'S APPARENT LONG-RANGE STRATEGY SUMMARY

GOALS	SYSTEM/80 METHODS AVAILABLE
Stimulate customer productivity and growth	Greater "functionality," ease of usage, high-level languages and problem-oriented languages, reliability and availability
Unify system software and reduce maintenance costs	One operating system for all users, security/integrity and privacy, distributed function, microcode, simplified software interfaces
Improve system posture vs. competition and lock in user base	More "functionality," accelerate technological rate of change, create new de facto standards, innovate
Reduce PCM exposures (peripherals, terminals and memory)	Distributed function, integrated packaging, microcode, multiple unique adapters, SDLC and loop attachments, complexity, host operating system software dependency
Increase profit margins	Exploit IBM economy of scale via LSI, common circuits and building blocks, unified software support and maintenance
Totally obsolete the 370 (eliminate or reduce used computer exposure)	RAS, functionality, privacy and security, ease of usage, greater effective performance, easier conversion, stabilize or reduce the people costs
Optimize FE/SE resources	Remote hardware and software diagnosis, remote Systems Engineering Application Development Services
Prevent downgrading	Special system packaging, software "diodes," controlled subsystem attachment by System/60 model

Figure Vtlt-8

(Continued from Page 16)

ment.

Volume production and deliveries of the Model 3033 will not get rolling until about the second or third quarter of 1978. Therefore, the vast majority of IBM customers will install this product in 1979.

Considering the huge influx of orders, one can extrapolate an enormous potential customer financial commitment over five years of nearly $8 billion, based on an estimated maximum production capacity of 400 units per year (worldwide average) for five years, or 2,000 units at about $4 million each. In contrast, peak 370/168 production or shipments of about 275 units occurred in 1976.

In light of this, one must ask: What is the expected life span of the 3033?

Short Life Span

According to R.T. Fertig, an industry analyst, the IBM 3033 and its forthcoming additional members — models 3032, 3031 and 3033 multiprocessors — appear to represent *interim* products with a relatively short competitive life span. Some of the evidence supporting this conclusion is as follows:

1. Lack of Architectural Improvements

A. The 3033 has a limited address range of 24 bits (16M bytes), which is insufficient considering the 100M byte main storage capacities expected in the early 1980s.

B. Like the other members of the 370 series (and other competitor systems), the 3033 cannot be "certified" as a secure system because of inherent architectural limitations in both hardware and software.

C. The 3033 channel functionality and total bandpass is still too restrictive (1.5M to 3M byte/sec) to handle a hierarchical storage structure with high speed staging devices such as charge-coupled devices, bubbles and bulk MOS storage devices.

D. Although the reliability, availability and serviceability (RAS) characteristics are sufficient for the 1970s, we believe that far greater RAS capability is essential for the critical data base/data communications applications of the 1980s.

2. Minor Technology Enhancements

A. The 3033 processor circuits are effectively about twice the density of the Model 168 and not state-of-the-art (e.g., the three-year-old Amdahl 470/V6 or Fujitsu M-190 provide higher density circuits).

B. The processor must be water-cooled because of the high level of heat which must be dissipated.

C. The main storage chips are still 2K bits vs today's delivered 16K-bit memory chips.

3. A Bottom-Up Design Change

An IBM spokesman explained the approach taken to the 3033 thusly: "We took the best of the 168 design and improved on it" to achieve greater instruction throughput or millions of instructions per second (Mips); e.g., buffers were expanded, extra registers were added, the I-unit was enhanced, interleaving level was doubled, etc.

It is also apparent that the 3033 was rushed to the market (believed to be a very short two-year development cycle vs. a typical five- to six-year phased development) in response to serious competitive challenges from the plug-compatible Amdahl, Fujitsu, Hitachi, Itel, Control Data Corp. and other mainframer products, e.g., Burroughs B7800, Univac 1100/80, Honeywell Information Systems 66/85, etc.

4. A New Generation System should be Introduced by 1980

A. The code name for the System/80 project is "New Grad." The high end of S/80 is known to be under development by an organization under the direction of Dr. John E. Bertram, IBM Systems Products Division vice-president of development and manufacturing.

B. We believe that "New Grad" will represent a major, but evolutionary and compatible, architectural and technological improvement over the 370 Series (including models 3033, 3032, 3031, etc.) and that S/80 will directly and effectively address the data security, ease of use, RAS and other vital functional requirements for the early 1980s.

5. Accelerating Rate of Technological Improvement (Performance/Price)

In 1971-72, the earlier versions of the 370 series represented less than a 2:1 *mainframe* performance/price improvement over the 360 line (using the Model 50 as a base for comparison); the 360/50 was initially delivered in 1965 and its successor, the Model 145, was first shipped in 1971.

By 1976, the substantially improved models 138 and 148 (among other 370 models) established a new performance/-price curve of about 3.5 to 4:1 compared with the 360/50.

Finally, by mid-1978 or 1979, the 3033 (also models 3032, 3031 and multiprocessor versions) will nearly double this performance/price (Mips/$) relationship such that a 3033 processor will offer approximately 8:1 performance/$ improvement ratio vs. the 360 curve.

In summary, the rate of increase in Mips/$ is accelerating as indicated in Figure VIII-7.

Dilemma for 3033

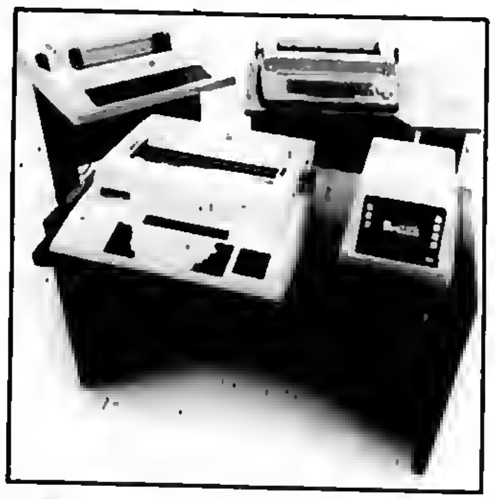
Assuming that the factors in the chart (admittedly circumstancial evidence) are approximately correct and that some members of S/80 are introduced by 1980, would it be prudent for IBM's 3033 customers to be locked into a four-year lease or purchase the 3033 in 1978-79? Obviously, the answer to this key question would vary depending on the individual customer circumstances.

IBM management may also decide to extend the life of the 303X line and delay S/80 one or two years; i.e., why take the risk of introducing new concepts, architecture and technology when the customer base is content with the old structure with improved Mips/$?

Another possibility is that S/80 may be a bottom-up announcement sequence (S/370 was top-down) and IBM wishes to avoid the typical "bubble" order effect when an architecturally new series is introduced with the obvious initial revenue shortfall. Therefore, one solution would be to lock in the high-end customers prior to unveiling S/80 at the low end (370/115 and 125 level).

Lecht is the author of four previous books on computer-related matters: The Programmer's Fortran II and IV, the Programmer's Algol, the Programmer's PL/I *and* The Management of Computer Programming Projects.

He is president of Advanced Computer Techniques Corp., which he founded in 1962, and has lectured widely for such groups as the Association for Computing Machinery, American Management Association, American Society for Information Science and Data Processing Management Association.



Is your terminal feeling rejected?

There have been a lot of cases of communication terminals being passed from manufacturer to leasing agent to user . . . and then subjected to total neglect. No wonder they start acting a little strange.

At Trendata we take steps to prevent terminal trauma. First we make sure you have the right terminal for your requirements by offering you a choice from our wide range of printing terminals and magnetic tape recorders.

Next Trendata makes sure your people understand all the features of our terminals by providing proper training. Then, when maintenance is needed, our own nationwide service people are right there, not some stranger. The end result is a well adjusted system, greater productivity, and happier customers. So, if you have mixed emotions about your present terminal set up, give us a call. We'd like to sit on the couch and talk about it.

Editorials

What Do You Think?

Often in the past we have advocated copyright protection for computer software as opposed to patent protection for computer programs. We may have been wrong.

We still don't like the idea of patent protection, but a long dissent by author John Hersey [CW, July 4] to the recent working report of the National Commission on New Technological Uses of Copyrighted Works (Contu) made us pause in our advocacy of copyright protection for programs.

Is a computer program really an act of imagination like a novel, poem or long piece of nonfiction? Is it in the same class as the written word in magazines and newspapers?

As Hersey said, each program may be considered a written creation of an author up to a certain point, but "beyond that point the same program is embodied in material form and becomes a *mechanical device*, which is engaged in the computer to become an essential part of a mechanical process.

"Thus the computer program is something strikingly new in our culture," Hersey added.

Perhaps, then, it is not a good idea to try to fit this new idea, a Janus-faced mixing of art and science, into an older system. Perhaps a new form of protection is needed, designed specifically for this new concept.

What do you think?

Time to Crack Down

Two people at Univac have been arrested for allegedly stealing time on a computer owned and operated by that firm, but the charge is mail fraud and conspiracy since there is no law covering computer crimes and criminals [CW, July 4].

But all that might change if Congress passes a new law proposed by Sen. Abraham Ribicoff (D.-Conn.) which would specifically cover this insidious type of white-collar crime.

It is a needed bill that is long overdue.

For too long white-collar crime has been tolerated in this country. The penalties for such crimes are not as stiff as those for other crimes — the embezzler gets a shorter prison sentence than the armed robber, even though the amount stolen is often higher. The computer criminal, when rarely apprehended, is tried for such things as mail fraud or wire fraud with relatively light penalties.

The Ribicoff bill would change all of that. It calls for prison terms of up to 15 years and fines of up to $50,000. Its existence would make law enforcement officials more aware of such crimes, hopefully leading to programs to train officers to detect such crimes, which too often go undetected today.

The bill is a good one and it apparently has bipartisan support ranging from liberal Democrats like Senators Ribicoff and Edward Kennedy to conservative Republicans like Strom Thurmond and Robert Griffin.

The legislation should be a high-priority item and people in the computer community should support it wholeheartedly, since most are honest and hardworking and should want to weed out the few bad apples in the barrel.

'There Are Only Two Problems . . .'

Letters to the Editor

Weil Modifies View of IMS/VS, But Lecht Finds It Still 'Poor'

Charles Lecht, in his book *Wares of Change* quoted my assessment of IBM's IMS data hase programming system [CW, May 9]. My observations were based on the views of an IBM user group which had been assembled in San Francisco by an independent market research firm.

It may interest you to note that subsequent to this user meeting, which was held in April 1976, I modified my views on IBM's IMS/VS per the attached article dated Oct. 11, 1976. In fairness you may want to publish the paragraph relating to IMS/VS in my Oct. 11, 1976 report.

Ulric Weil

Morgan Stanley & Co.
new York, N.Y.

Weil enclosed a "Progress Report" on IBM published by Morgan Stanley & Co. which said, in part, "Recent analysis reveals that IBM's much-maligned IMS/VS data base system (see our *Progress Report* dated May 7, 1976) is now performing more satisfactorily than we had expected. (Our observations last spring were based on data relating to IMS/360, collected in late 1975.) IBM's recent improvements of IMS/VS appear to have remedied much of what was wrong with IMS." Ed.

- - - - - - - - - - - - -

In reference to Ulrich Weil's letter to you, IBM's principal medium- to large scale data base offering, IMS/VS, may in fact he performning more satisfactorily. Generally, however, all manufacturers tend to improve their product offerings over time if they wish to remain competitive.

The question, then, is how one can quantify this relative improvement and evaluate the true customer perception of IMS/VS. Most IMS/VS users are not on latest versions. Not unexpectedly, the newest version package price has recently gone up.

A recent survey of over 500 IBM installed data base users indicated only about 12% are currently using the old IMS2 (360), 34% are using IMS/VS (DB) and approximately 27% were running IMS/VS (DC). Obviously, some overlap of survey response between the DC and DB versions is probable; however, surprisingly, nearly 30% were using Mark IV (a non-IBM data base package).

Moreover, the same extensive study found that on the average about 35% of the current users think IMS/VS is not suitable for their future needs.

In our judgment, based on this survey as well as upon Advanced Computer Techniques Corp.'s extensive experience dealing directly with data base users, IMS/VS has improved. That is, it has moved up from atrocious to poor, with CICS/VS possibly having taken over the spotlight in the atrocious category.

Charles P. Lecht
President

Advanced Computer Techniques

In Defense of Consultant at Rest

Regarding the photo front and center Page 1 of your June 20th issue, please be advised that Roger Buchanan's phone has not stopped ringing since.

The unfair implications of this picture have been widely misinterpreted, as Mr. Buchanan is one of our senior staff consultants and was in Dallas demonstrating a microcomputing system we at Performance Development Corp. have developed for a client.

Mr. Buchanan is simply exhibiting PDC's innovative flair for going to the source for the requirements statement. That such a source may have departed does not always deter us.

Leo J. Cohen
President

Performance Development Corp.
Princeton, N.J.

Data Past

Five Years Ago
July 12, 1972

WASHINGTON, D.C. — Sen. Sam J. Ervin (D-N.C.) charged the Supreme Court with "unwisely and wrongly" ignoring the danger of computer-based data banks when it rejected an attempt to outlaw such dossiers in the Tatum vs. Laird case. To remedy the court's alleged oversight, Ervin introduced legislation in the Senate to prohibit the Army or any military service from conducting data bank operations on civilians.

— — —

DAYTON, Ohio — Codasyl's Programming Language Committee met here to consider a proposal to delete the Report Writer facility from the Cobol standard. The proposal, initiated by the Air Force, called for dropping the RPG-like function because "it was redundant with features in the language and too complicated for the general report-writing needs of the user community."

Eight Years Ago
July 16, 1969

WHITE PLAINS, N.Y. — IBM cut its maximum educational discount from 30% to 10% and announced that effective Nov. 1 it would no longer offer an educational allowance on maintenance agreements.

DP Experts See Need for Better Performance Measures

By Jack Stone
Special to Computerworld

Productivity was my watchword last week. First, I attended the National Conference on Computer Systems Productivity, sponsored by *Government Executive* magazine and the Capitol (D.C.) Area chapter of the Society for Management Information Systems, where I made a presentation on human engineering in the DP environment.

Then, I was invited to give a talk on productivity considerations in the operations department to the DP management group of a large corporation.

My briefing was one of four given the same day by a panel of outside consultants to this company, whose management has become vitally concerend with improving productivity in all areas of its DP activity. The other talks dealt with productivity gains possible through human resource development, systems analysis training and structured design and programming techniques.

As I reflected on my experiences of the last week, I reached several conclusions.

First, the issue of productivity is one of significant and growing concern to management. I believe this interest derives in part from the difficulty senior DP managements are having in justifying their continually increasing budgets to top executives and, in part, from the difficulty top executives are having in justifying incumbent DP managers in their current positions.

I believe few front-office executives feel they have adequate measures or standards of performance or productivity from the DP organization. I suggest the current wave of DP management insecurity has come about because the shakers and movers of business and government organizations are no longer tolerating the absence of valid and comprehensible performance data. They are saying, to paraphrase a familiar machine-room expression, "Get the DP data up or get the DP managers out!"

Second, the arena for determining productivity has vastly broadened — moving from the narrow focus of channel contention for disk drive access to serious consideration of the broadest issues relating to quantitative measures of productivity in terms of user acceptance and organization profitability.

Bob Head said at the conference, "Work on system productivity has been largely at the relatively narrow technical level of seeking to improve performance by obtaining greater 'throughput' from installed equipment.

"What is now required, and is indeed already beginning to take place, is a broadening of this activity through its elevation to the level of top ADP management interest. The utilization of complex and expensive system resources is becoming a problem too great to be left to performance measurement specialists."

Third, a scientific and quantitative approach to performance measurement is moving rapidly into all areas of the DP function. Ken Rau suggested at the conference that "performance measurement applied to application software development, application maintenance, equipment operation, data control and other functions and tasks associated with DP can produce far greater improvements in control, productivity and motivation than can computer performance evaluation techniques alone.

"Furthermore, a performance measurement program can provide management with its first quantitative reports for tracking and analyzing the data processing resource."

On the other hand, the availability of techniques and methodologies for obtaining objective data does not of itself assure a successful productivity measurement program. There is the very practical — but often overlooked — matter of gaining agreement from all interested parties on what constitutes the productivity standard(s), how productivity should be measured and what action should be taken to control deviations from standard.

The Human Connection

"The most difficult task in improving productivity is developing a plan that is comprehensive, cost-effective and acceptable to the many parties involved in the total computer system," Leo Barnecut commented at the conference.

Another conclusion is that increasing attention is being given to the particular challenges of improving the productivity of DP personnel in ways other than providing the time-worn mechanical solutions of more computer time and systems development techniques and methods. One concern is that of seeing human productivity diminish as hardware becomes obsolete.

John Carabello, director of automation policy at the U.S. Department of Defense told the conference that "more than half the government's inventory [of computer mainframes] is mid-Sixties technology. What are the productivity implications?

"We know that over time, there has been a downward trend in the cost per unit of processing power. [We also know that] good management would attempt to parallel the trend of available productivity improvement, but is offset somewhat by the economics of capital investment, the cost of conversion, administrative procedures, etc. Obsolescence can be defined as a continuing divergence from effective management . . . Let's rapidly extend the implications of hardware obsolescence and see where this basic factor takes us.

"The most obvious corollary is that hardware obsolescence induces software obsolescence . . . This leads to another corolary: that we have a problem of people obsolescence. Living in the past of obsolete hardware and software means that the productivity of our personnel does not rise — in fact, it will go down, since we will also tend to neglect training and have problems attracting and holding skilled people."

As a final conclusion, it was abundantly clear the base issue of the setting of standards and the measurement of productivity for a particular *individual* in the DP environment has been largely ignored, with the notable exception of the data entry folks.

Granted, most DP personnel operate as teams, but there are still objective measures that can be established by competent DP managers and supervisors to establish productivity goals — or is it that these people want to avoid measurements of their own performance?

Sale of State's Driver Master Tapes Causes Concern

The idea of using laws to protect privacy from invasion by computer is now generally accepted. This is quite a change. Only a few years ago it seemed that because the noncomputer era had needed no such protection, it would be improper to effectively penalize the computer era by putting additional constraints on computer operation.

The Taylor Report

By

Alan Taylor, CDP

However, the increasing flood of computerized output in various forms gave rise to the realization that action had to be taken. As computer power made the use of large masses of information more economical, personal data became subjected to some questionable uses.

A lot of the controversy swirled about the use of the Social Security number (SSN), which was at that time approved by many of our professional bodies for use as a universal identifier, suitable for connecting records from various areas. The proponents of the universal identifier idea argued mainly on economic grounds. They urged that Social Security numbers should be given out at school age, or earlier. The opponents argued that the dangers of possible abuse by people developing "dossiers" was too high a price to pay for such an economic advantage.

During the struggle, a large amount of unexpected use of the SSN was found to exist in areas well outside its original intention — such as in library cards, student numbers and driving licenses.

As these uses were found and commented upon, it became general practice not to absolutely insist on the use of a person's SSN if he objected to revealing it and having it used, while continuing the practice of normal use of the number for the great majority of cases.

At the same time, privacy legislation went into effect to protect the public from the dissemination of personal data, and the whole issue faded back into near-oblivion, with potential abuse apparently checked.

However, a recent advertisement in the Boston area offering for sale the master file of the driver registrations in Massachusetts made me wonder whether there has been any real change or only a cosmetic one.

Certainly it has raised questions with some readers of this column who feel that their personal data should not be made available by the Registrar of Motor Vehicles without their knowledge and consent. And the facts seem such as to support their fear — even if the current privacy law does permit the distribution of "public records" containing personal data so the legality of the sale seems unquestionable.

Borderline Case

Yet the whole matter makes me uncomfortable. It seems to be a borderline case. No one has suggested that any actual abuse has been identified. The objection comes from the possibility of abuse.

A specific objection has been made by readers to the distribution of the SSN. It has been argued that if the registrar is going to sell the master file, then everyone should have been told of his intention before they were asked to provide their SSNs.

Another objection has been made to the continued use of the SSN for any use if sales are to take place. And I see merit in that point, too.

Yet the real question is whether the public record exemption, in this computer age when the economics of mass data processing are so attractive, makes sense as a blanket exemption from privacy rules. Suppose the registrar had properly warned people about his intention to sell or had completely abandoned the use of the SSN as an identifier.

Suppose the "master file" is in its most innocent possible form — name, address and nothing else. Would there still be an objection to copies of the master tape being sold?

If so, what is the basis for the objection? How would proper access to public records be attained if such mass sales were to be forbidden?

These are the questions that really need answering in order to see why the current situation is uncomfortable. If you have any answers, pro or con, on any of these questions, please let me know. The best way would, of course, be through a letter. But a quicker way may be to use the questionnaire provided here.

© Copyright 1977 Alan Taylor. Reproduction for commercial purposes requires written permission. Limited numbers of copies for non-commercial purposes may be made provided they carry this copyright notice. The views expressed in this column do not necessarily reflect those of *Computerworld*.

What Are Your Views?

The Massachusetts Registrar of Motor Vehicles is currently selling the master tape of registered drivers in the state. Social Security Numbers are normally used as the license identifier; although if an objection is raised when an application for a license is made, the Registrar will not insist upon its use.

No information regarding the sale or possible sale of the Registrar's master file is given to license applicants at the time they are asked for their Social Security number.

(1) If this were the situation in your state, would you be uncomfortable with the sale of the master tapes?
( )Yes ( )No
Why?

(2) If you were given full information about the future sale of the tapes when you were asked for your Social Security number, would that be agreeable to you?
( )Yes ( )No
Why?

(3) If the use of Social Security numbers were stopped, would that make you comfortable?
( )Yes ( )No
Why?

(4) What other comments or suggestions do you have?

Please send the completed form to Alan Taylor, c/o Computerworld, 797 Washington St., Newton, Mass. 02160. Thank you.

IBM Part in Nigeria Done 'Watson Style'

I was surprised and pleased to find the article, "Nigeria Boosting DP Training" in the May 16 issue of *Computerworld*. In it there is a brief reference to IBM's African Education Center located at the University of Ibadan, Nigeria, and to the fact the university has just graduated its first class of computer science students.

In the face of all the adverse publicity IBM has received over the years, I feel it is important to expand a bit on that story, since I have personal knowledge of that situation and of IBM's motivation for putting resources into it.

In 1962, the late Arthur K. (Dick) Watson, who for many years headed IBM's World Trade activities, decided it was IBM's responsibility to "do something" for the people of the developing African nations. In typical Watson style, he opted for an IBM-sponsored education program.

This program was full-scale DP training combined with the equivalent of about one year of business administration education. It was my good fortune to be chosen as the person to be sent to Africa to direct that activity for IBM.

The story of how Ibadan was chosen as the site of the center; of the selection of 50 students (out of 5,000 applicants from eight countries) to receive full expenses-paid tuition to the two-year program; of supervising the building of the center; of the tremendous cooperation provided by the University of Ibadan and of various U.S. government and private groups; of the innovative teaching techniques employed there in order to make the program a success; of IBM's successful effort to place the graduates of that program in DP jobs in their home countries; and finally, of IBM's unrestricted gift to the university of a fine, fully equipped DP education center is much too long to tell in this letter.

Suffice it to say that Watson's concern for the developing African nations, as manifested in the IBM African Education Center, undoubtedly has changed the lives of hundreds of Africans.

The obvious question is, what was in it for IBM? If my memory serves me correctly, at the time Watson made that decision, IBM's total revenues from all of the black African countries combined would not have equaled that of the tiniest IBM branch office in the U.S.

Watson's motive was to provide a service, the kind that only a company like IBM could or would provide.

Now, 15 years later, IBM's investment apparently continues to provide benefits in keeping with Watson's and IBM's original intent.

Nate A. Newkirk
Mt. Kisco, N.Y.

A Misnomer?

Now that we've settled the disk vs. disc controversy (IBM uses disk so it must be disk), may I ask if the same solution applies to what I consider a misnomer for a date in YYDDD format?

It seems prevalent to call this a Julian date, yet *Webster's Dictionary* says a Julian calendar has 12 months, each month having 28, 29, 30 or 31 days.

Therefore MMDDYY is a Julian date. The Gregorian calendar modified the Julian Calendar as to when leap year occurred and shortened 1582 by 10 days. Still 12 months.

Why then is YYDDD called a Julian Date? I prefer Ordinal Date (ordinal-a number designating the place in an ordered sequence).

Don Dietrich
Seattle, Wash.

'Little Guy' Replies

In his May 30 letter, Robert W. Caugney, vice-president, Applied Data Research, Inc. (ADR), took exception to Michael Hart's comments about National Computing Industries' (NCI) Slick.

It is very interesting to me how the "big guy" starts to squirm when the "little guy" makes big strides (over 300 Slick sales) into his marketplace.

Caugney's assertions were the erroneous ones. The facts are:

First, Community Blood Council of Greater New York, Inc. purchased Slick III on May 21, 1976, when the price was $2,450, not $2,950. This was our Version 2 release, which was not just comparable to, but actually more powerful than the stripped-down version of the Librarian called Librarian/E, which sold for $400 more than Hart paid.

Second, in the May 5 issue of *Computerworld*, NCI announced Version 3 of Slick with prices ranging from $2,450 to $2,950. The $2,450 version (Slick I) still has more power and capabilities than Librarian/E at $2,850, while Slick III at $2,950 is superior to the "full" Librarian at $4,900 to $5,800.

Third, the 20 minutes of ADR technical support service to install Librarian is not comparable to the three days Hart stated, which was not only to install but also to fully convert and become operational.

Fourth, in addition to doing all that the "full" Librarian does, Slick has exclusive features such as dynamic recall, a report writer, multi-level security, complete audit trail facilities, DOS return codes and many others.

I challenge Caugney or anyone else to prove that Slick III Version 3 is not a better product than the "full" Librarian at any price, let alone being $2,000 less expensive.

ACPA? What is it?

ACPA is the Association of Computer Programmers and Analysis . . . the ONLY international professional society developed by and for computer programmers and analysis. The majority of the ACPA membership consists of computer practitioners, although many of our members are managers, educators, and computer scientists. More than half of our current Board of Directors are people who design, program, and implement computer applications.

ACPA is dedicated to:

Professionalism

ACPA is a Charter Society and one of the founding member societies of the Institute for Certification of Computer Professionals (ICCP) the organization that administers the Certificate in Data Processing (CDP) program.

ACPA participates in American National Standards Institute (ANSI) standards development activities.

ACPA participates in the Computer Caravan, providing speakers and organizing programs at the various Caravan stops.

ACPA has applied for membership in the American Federation of Information Processing Societies (AFIPS).

Education

ACPA holds an annual conference which brings together some of the most outstanding professionals in the field in interesting interchanges of ideas, information, methodology and techniques.

ACPA holds seminars, workshops, and meetings which further the professional competence of its members.

Membership

ACPA provides membership categories for a wide variety of needs . . . corporations and institutions, students, and both experienced professionals and newer computer practitioners.

ACPA provides chapter organizations which provide local educational and social activities for members.

ACPA provides publications . . . chapter newsletters, an international newsletter, and a national computer magazine.

ACPA provides additional benefits including seminar discounts, book discounts, a job service, etc.

To find out more about ACPA, its programs, its activities, and its membership, write:

One Attendee's Viewpoint

NCC: 'The Entire Computer Industry Under One Roof'

By Dennis J. Streveler
Special to Computerworld

If you didn't go to Dallas because you were sure your knowledge of computer technology was up-to-date — you comprehend the subtle difference between the HP 3000 Series I and II, you know an IBM 3330 from a 3033 and you were positive you did not want to see more teletypewriter compatible terminals no matter what the price — you would have been in for a shock. For this was the year of the micro.

Names like Commodore's Pet Computer and Apple Computer's Apple II and the already-venerable Imsai 8080 were bantered about at least as freely as "distributed processing" or "networking" or "subschemas." In fact, last year's conceptual buzzwords were often overshadowed by nuts-and-bolts terms such as the S-100 bus, ROM, RAM and logic modules.

It seems clear the industry is perched atop still another volcano. But this one hasn't erupted yet. Software is still in abominable shape (remember the early mini years?) and many micro peripherals are about as reliable.

Micro vendors apparently need some help from Madison Avenue in retuning their ads away from a bit-byte-baud format to something the mass market can understand.

Still, someone needs to address this question: What *can* these machines do which is useful to humanity? In lieu of an answer to this fundamental question, the only market is status seekers and gadget addicts.

But I doubt whether the American home needs another gadget (I'm still trying to understand why we need trash compactors).

However, everyone does assume — and rightly so — that this cheap computer power is valuable and that it will provide logic for a myriad of personal process control, data collection and home entertainment applications. The technology is here and it is cheap.

We know how to write the software (although probably not exactly to Dijkstra's liking). And there certainly is a plethora of eager vendors and retailers ready to pounce on the unsuspecting marketplace.

When the volcano will erupt is as much a riddle as is when Mauna Loa will pop off. Or when the San Andreas will rid us of the Southern California blight.

Strictly Business

No, the National Computer Conference was not *all* micros this year. In addition to the personal computing exhibits, there was another, larger area of exhibits in a more traditional vein.

But this year there was little excitement, few new announcements and surprisingly fewer gimmicks.

Gone was the Data General organ grinder who stood outside the New York Coliseum on those sweltering days last year. Gone were the speakers of national political consequence such as the then little-known, self-proclaimed technocrat, ex-governor of Georgia who addressed NCC in Anaheim two years ago.

And gone, too, were the booth numbers on the exhibit floor, rendering the exhibit maps virtually useless.

As IBM never truly adjusted to (or seemingly comprehended) the implications of minicomputer technology (IBM was often absent from recent NCCs), the two largest minicomputer manufacturers, Digital Equipment Corp. and Hewlett-Packard, were both conspicuously Awol this year.

IBM touted its System 34. (The most coveted button this year was *Computerworld's* "Pray for IBM." Now I know why.)

The usual pitches on business minicomputers, xerographic printing from mag tape, voice response, COM and replacement peripherals could be heard echoing about the cavernous exhibit floor. (I think CDC can now build a 370 replacement from the ground up, including the "Think" sign.)

My vote for "most exciting new product" goes to Texas Instrument's very impressive (and impressively expensive) bubble memory terminal. Incidentally, TI's chairman, Mark Shepherd Jr., kept the keynote address audience spellbound talking about — what else? — microcomputers and the future.

The conference chairman this year was Dr. Portia Isaacson, whose current profession is — you guessed it — microcomputer retailing.

The jazziest exhibit was definitely Univac's. Its multimedia, real-time animation was delightful. But, quite frankly I can't quite remember which product it was pushing this year. Was it its newly acquired minicomputer line?

The program was, as always, a classic study in overchoice. One normally has to emulate a time-slicing discipline of one's own to take in all the "Must" sessions. The program included many well-attended sessions on microcomputers and "personal computing." Surprised?

Reader Commentary

The traditional topics were also discussed, but it is safe to say this NCC was lacking somewhat (by choice, I understand) the trappings of academia.

Not all sessions were of equal caliber, of course. To my dismay, some sessions seemed short on material and actually adjourned early, which to my recollection was unheard of in previous years.

Here are a few tidbits from the sessions:

- "Information manager" seemed preferable to the term "data base administrator." I guess that makes sense, but I've just recently become accustomed to the buzzword "DBA."
- Computer output microfilm technology has been "married" to on-line computer technologies, according to one speaker. A questioner preferred the more descriptive (and accurate) term "shotgun wedding."
- Pioneer Days are always impressive. This year's was even more so. By floating among the exhibits and among the pioneers from Los Alamos, the computer's entire

save time and money by joining McGraw-Hill's new COMPUTER PROFESSIONALS' BOOK CLUB

THIS new professional club is designed to meet your day-to-day on-the-job needs by providing practical books in your field on a regular basis at below *publisher prices*. If you're missing out on important technical literature—if today's high cost of reading curbs the growth of your library—here's the solution to your problem.

The Computer Professionals' Book Club was organized for you, to provide an economical reading program that cannot fail to be of value. Administered by the McGraw-Hill Book Company, all books are chosen by qualified editors and consultants. Their understanding of the standards and values of the literature in your field guarantees the appropriateness of the selections.

How the Club operates: Every month you receive free of charge *The Computer Professionals' Book Club Bulletin*. This announces and describes the Club's featured book of the month as well as alternate selections available at special members' prices. If you want to examine the Club's feature of the month, you do nothing. If you prefer one of the alternate selections—or if you want no book at all—you notify the Club by returning the card enclosed with each *Bulletin*.

As a Club Member, you agree only to the purchase of four books (including your first selection) over a two-year period. Considering the many books published annually, there will surely be at least four you would want to own anyway. By joining the club, you save both money and the trouble of searching for the best books.

MAIL THIS COUPON TODAY

COMPUTER PROFESSIONALS/Book Club
P.O. Box 582 Princeton Road, Hightstown, New Jersey 08520

Please enroll me as a member and send me the three books indicated. I am to receive the two bonus books at the introductory price of $2.95 plus my first selection, plus tax, postage, and handling. If not completely satisfied, I may return the books within 10 days and request that my membership be cancelled. If I keep the books, I agree to take a minimum of three additional books during the next two years at special Club prices (guaranteed 15% discount, often more). I will receive the Club Bulletin 12 times a year. If I want to examine the featured selection, I need take no action. It will be shipped automatically. If, however, I want an alternate selection—or no book at all—I simply notify the Club by returning the convenient card always enclosed. I will always have a minimum of 10 days in which to return the card and you will credit my account fully, including postage, if this is not the case. Membership in the club is continuous but cancellable by me at any time after the four-book purchase requirement has been filled. *This order subject to acceptance by McGraw-Hill. Orders from outside the continental U.S. must be prepaid. Company, business, or institutional tax exemption status is not applicable to purchases made through individual Club memberships. All prices subject to change without notice. Offer good for new members only.*

Letters to the Editor

NCC Showed Interest In Certification Low

It is with bewilderment that I continue to read about how the computer industry is moving ahead on certification when the *people* in the business have very little interest or desire in being certified.

Since my own prejudices sometimes sway my decisions, I took time out to visit both panel discussions on certification at the recent Dallas National Computer Conference. The two sessions were "ICCP and Certification. Move Forward" and "The Certificate in DP/Certification Examinations for Programmers" and both were placed in the management segment of the conference.

My reason for sitting in briefly on these sessions was to determine what interest others have and possibly to change my mind on the overall desires of the industry. Both sessions had fewer attendees than any other I attended — I counted less than 100 in one of them.

If there is any interest in certification other than from the academic community, which has a financial interest, I failed to see it at Dallas. A debate was held and no one cared.

So why not let the creative people of this industry work and contribute to their respective companies and selves and stop trying to convince them that they need to "join" something to be worthwhile?

T.C. Bartz
Oshkosh, Wis.

Sources Sought

Many readers of my introductory article on the Cobol Report Writer [" 'Report Writer' Reduces Coding, Debugging Task," [CW, April 25] have written to me requesting additional sources of information on the Report Writer.

Unfortunately, I am not aware of the existence of any information on Report Writer other than Cobol compiler implementers' reference manuals. I plan to write a programmer-oriented book on the subject in the future, but that does not fulfill the immediate need.

Should any reader know of a good source of Cobol Report Writer information, please cite it in a "Letter to the Editor."

William R. Englander
San Diego, Calif.

Right on the Mark

I would like to compliment *Computerworld* on Part I of the "Role of the Distributor" [Manufacturers Emphasize Significance of Recruitment," CW, June 13].

Speaking from the vantage point of one who has spent the last year bootstrapping a grossly undercapitalized software house into existence, I can testify that the article was right on the mark.

Laurance F. Wygant
Schaumburg, Ill.

NCC: Everything Under One Roof

(Continued from Page 21)

history was visible.

Ed Voorhess, one of the LASL pioneers, describing the IBM card programmed calculator (Jacquard would have loved it), mentioned the fact that it came with a total of eight registers. Yes, eight.

But one could upgrade to a total of 48 by adding modules the size of "ice boxes," each containing up to 16 registers.

Under the same roof one could see the densely packed chips of today and hear predictions of 64K bytes in 8 square inches by 1980.

In the program there were the usual sessions dealing with the relative merits of Codasyl vs. Mumps for data base management, with the value (or lack of same) of the Certificate of Data Processing, and with the (in)security inherent in most operating systems.

Software gurus heard Yourdon and Weinberg and Mills and McCracken. Hardware types were delighted with Amdahl. We were entertained by Herb Grosch and admonished by Jim ("Why Managers Fail") Towsen.

Elsewhere at NCC

You could have loitered, resume-in-hand, waiting to be accosted by a body snatcher. You could have entered the devilish programming contest. You could have visited the Computer Fair and seen a complete computer, along with an impressive array of peripherals constructed completely from surplus and scrap, (i.e., junk).

You could have made the rounds among the hospitality suites after dark — a blessing since Dallas' sidewalks do not roll up after dark, they self-destruct.

The NCC is still the world's best watering hole of ideas, people and machinery — it is quite literally the entire computer industry under one roof.

It is a time of speculation, frustration, contemplation. It is a time of spirited exchanges on most every germaine topic.

I am never amazed when the impressive attendance figures are announced following the closing of the NCC. In fact, I am always amazed that the attendance figures aren't even higher.

See you in Anaheim next June?

Streveler is systems engineer at Straub Clinic and Hospital in Honolulu, Hawaii.

THE MATCHMAKER

Very little stands between your mini and the disk drives of your choice.

Just Telefile's little Matchmaker disk controller. With it, we can put your minicomputer together with *any* of the latest 3330-type disk drives: Ampex, Memorex, CalComp, Control Data, or Diablo. You'll have a system no one else can match.

Greater flexibility.

Special tailor-made, compatible interface modules make changing minicomputers a snap.

To change drives, simply switch circuit boards. Capacity can grow from 13.3 million to 1.2 *billion* bytes per system.

Interface software included.

Telefile even provides handlers that make the Matchmaker software transparent to the operating systems of most major minicomputers.

Unmatched features.

Telefile's Matchmaker controller brings to minicomputer users the latest large mainframe disk technology with such features as: *Search and read command* to help you with data base management. *Write protection* to the sector level. And *Advanced error recovery* techniques.

The Matchmaker even comes with a separate maintenance module for offline disk pack formatting and test exercising.

And Telefile stands behind the system not only with hardware and software, but with nationwide service support in major metropolitan areas.

Write for our authoritative book.

100 fact-filled pages on the universal Matchmaker concept including operation, functional specs, features, diagnostics, installation, and maintenance. Get it free by writing: Telefile Computer Products, Inc., 17131 Daimler St., Irvine, CA 92714. Or call toll-free (800) 854-3128. In Calif., (714) 557-6660.

DS/3000 brings remote computers within your reach

HP plots in its LSI lab

HP 9896- desk top computing for first time users

HP 2640 Series- the polyglots among terminals

HP 3000 SERIES II

What can one HP 3000 say to another?

Plenty!

With Distributed System/3000 (DS/3000), it is now possible for one Hewlett-Packard 3000 Series II to communicate with others. A group of HP 3000 systems can now pool and share their resources and data. Plus, a user on one system has access to the capabilities of all . . . no matter where the computers are located. In DS/3000, a remote HP 3000 can be just across the room from your local HP 3000, or as far away as standard data communications facilities can reach—across town; across country; across the world. And all this with no significant increase in complexity for the user.

Using a DS/3000 network is straightforward and simple. Programming in a DS/3000 environment is just like programming a local HP 3000. Interactive users and applications programmers do not need to learn new communications commands or do special function programming. To access a remote HP 3000, the interactive user need only add the word "REMOTE" to each command to indicate the system he or she wishes to use. DS/3000 is integrated into MPE II—the HP 3000's innovative Multi-Programming Executive operating system that provides for multiple interactive and concurrent batch operations. With this approach, the same powerful MPE II facilities used for local sessions are also available on a remote HP 3000.

If you can type the word "REMOTE," you can use DS/3000

```
:HELLO MIKE.DCA
 SESSION NUMBER = #S91
 TUE, MAY 31, 1977, 10:49 AM
 HP32002B.00.35

         WELCOME TO MANAGEMENT SYSTEM
         *******************************
```

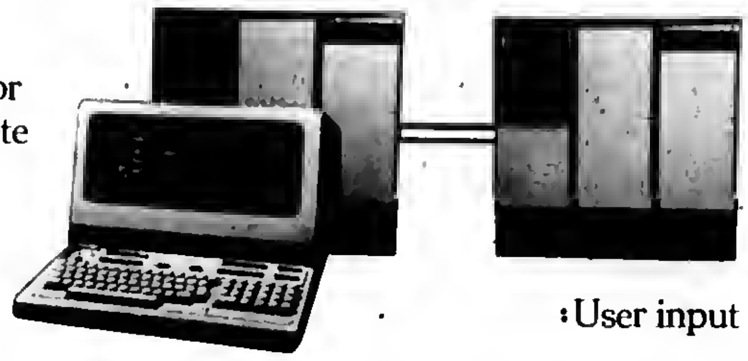
Start a local session
To gain "virtual terminal" access to remote systems, log-on to your local system in the normal manner. Enter the HELLO command.

```
:DSLINE PR2
 DS LINE NUMBER = #L3
```

Open a communications line
Use the operating system command, DSLINE, to establish a link with one or more remote HP 3000 systems (either hard-wired coaxial, or public telephone with modems).

```
:REMOTE HELLO MIKE.DCA
 SESSION NUMBER = #S150
 TUE, MAY 31, 1977, 10:49 AM
 HP32002A.01.H+

          WELCOME THIS IS PR2
         *********************
```



Go remote
By using the same HELLO command as before, but by adding the word REMOTE, you start your interactive session on a remote HP 3000. Now, all the powerful MPE II commands are available for you on both the local and the remote HP 3000 Series II. Your terminal conveniently serves as "virtual terminal" for both.

: User input

MPE II also brings an accounting structure and file security that provide protection against unauthorized use of local or remote HP 3000 systems and their data files.

DS/3000 networks strategically disperse computing power wherever day-to-day work is being done. They implement in hardware and software the organizational communication lines that already exist among the people of a company. The result is computer processing and data communication mapped onto existing company structures, with a lot of timely and accurate information flowing back and forth.

DS/3000 software costs $9,000* for each HP 3000 in the network. System prices start at $110,000* **For further information check A on reply card.**

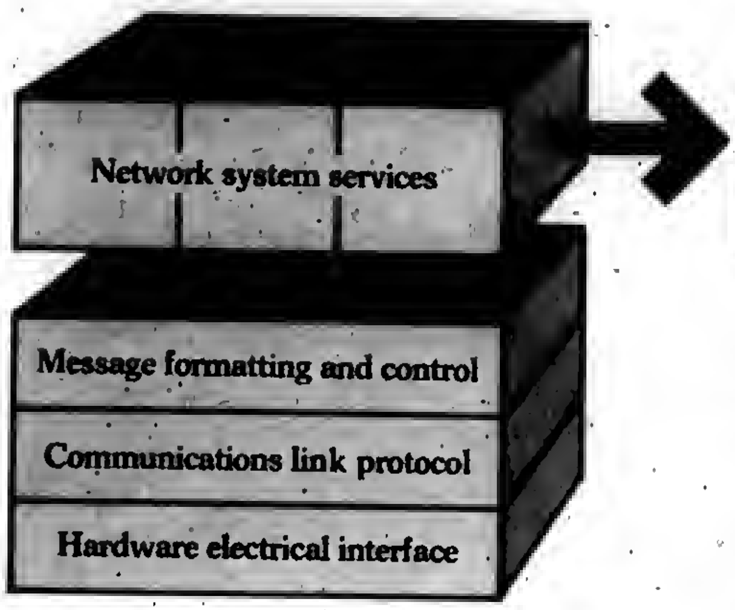
Hewlett-Packard

Layered implementation

Computer users want high level network capabilities that do not require specially trained professionals in data communications. A logical way to accomplish this is to integrate data communications into the operating system and provide transparent access to remote processing and remote facilities. Complex requirements of the data communications environment, such as modem and line control, error checking, and recovery, should be handled by vendor hardware and software and should be invisible to network users.

This principle guided the architectural design of DS/3000. DS/3000 software is organized into structural layers so as to separate matters of routine from matters of user concern. HP software and hardware automatically handles the first three layers.

Accommodate new technology
Technology in communications is rapidly changing. HP is committed to bringing these advances to customers. A layered approach facilitates this. Each layer to a large extent functions independently. HP can make network enhancements to DS/3000, for example, a new line protocol, by providing a new software/hardware update to one layer. This change does not affect either the structure or the usage of DS/3000. HP can move with industry technology. The customer simply purchases a software upgrade or new hardware interface. Applications and programs need not be changed. With DS/3000, users have today's and tomorrow's communications.



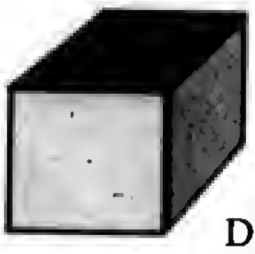
Network system services
Message formatting and control
Communications link protocol
Hardware electrical interface

The layers
The first layer, the electrical interface to external modems, meets EIA RS-232C and CCITT standards. Systems can be linked over common carrier facilities at speeds up to 9600 bits per second or over hardwired lines (coaxial cables) at line speeds up to 2.5 million bits per second.

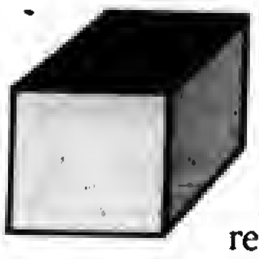
The next layer is concerned with link protocol in a point-to-point configuration. It concurrently multileaves data bi-directionally over half or full duplex common carrier facilities using IBM-compatible Binary Synchronous Communications (BSC) protocol.

The third layer automatically handles conventions of message formatting and manages the flow of messages between systems. Here HP designed its own standard format.

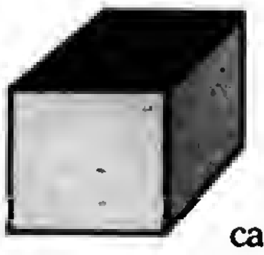
The top layer is the most exciting, for it represents the set of full, high-level system services available to the user on DS/3000.



Interact Locally and Remotely
The remote command processing capabilities of DS/3000 make it easy for interactive users of a local HP 3000 to utilize that same set of capabilities on a remote HP 3000. The local terminal becomes a "virtual terminal"; with it the user has full use of a remote system as if it were local. That includes all MPE II commands, language and utility subsystems, and remote user applications programs.



Share A Resource
MPE II treats all devices as files. With DS/3000, you have full remote file access to all devices and data files on another HP 3000 (after validating your authorization, of course). Smaller HP 3000 sites in a network can share the processing power of a larger HP 3000 using its software subsystems or a variety of peripheral devices. Simply expand the MPE II FILE command to identify the remote system. No application reprogramming is required.



Communicate Program to Program
With DS/3000 separate applications programs running in separate systems can directly and efficiently exchange data and control information with one another, thanks to a set of nine new easy-to-use program callable procedures. Program to program communications facilities also allow one user program to initiate or terminate programs on remote systems.

Prior to exploding the master production schedule, the engineering staff makes changes on the **engineering data control** system.

HP terminals overcome the language barrier

Being an international company involves more than maintaining overseas operations. It means being sensitive to language, cultural, and social differences.

The sophisticated HP 2640 series terminals respond to one of those differences — language.

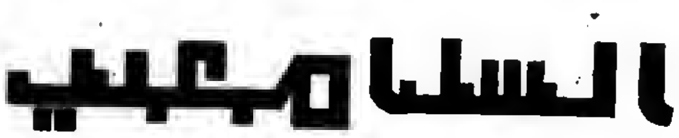
Functional modularity
To simplify implementing new languages, HP localized all the language capabilities on just two character set modules. These modules provide all the capability to use concurrently a combination of four sets — 128 characters each. Characters from bilingual sets can even be displayed adjacent to each other.

Hardware modularity
A single bus is common to all logic modules. Therefore, any module, including those that control the character sets, can plug into any slot in the bus. Any combination of enhancements (more display memory, cartridge tape units, printer capability, or data communications) can be added by simply plugging in the appropriate logic module. For easy repair, just open the terminal, pop out the board, and pop in a new one.

Microprocessor control
All 2640 operations, for example, memory allocation and data communications, are microprocessor-controlled.

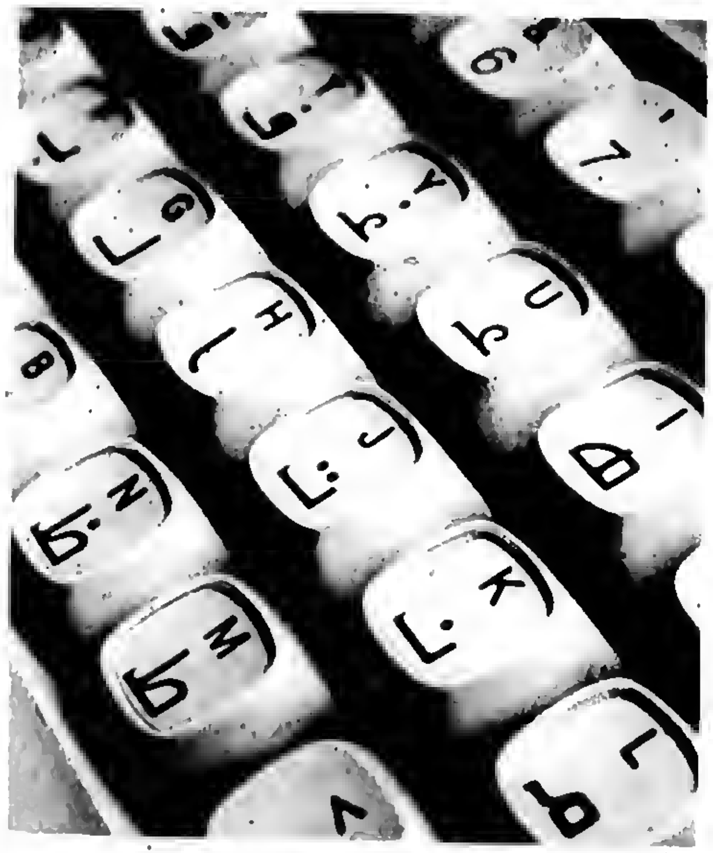
This microprocessor also controls the keyboard. Key functions are independent of their respective position on the keyboard. With this approach, engineers can easily accommodate not only the unique character sets of different languages, but also preferred keyboard layouts.

New Arabic terminal
A new terminal, the 2645R, displays both Arabic and Roman characters. Special design considerations were encountered in implementing the Arabic language. First, the characters had to be aesthetically pleasing, readable, and correctly drawn to capture the script-like Arabic style. A character set allowing for horizontally continuous characters was designed.

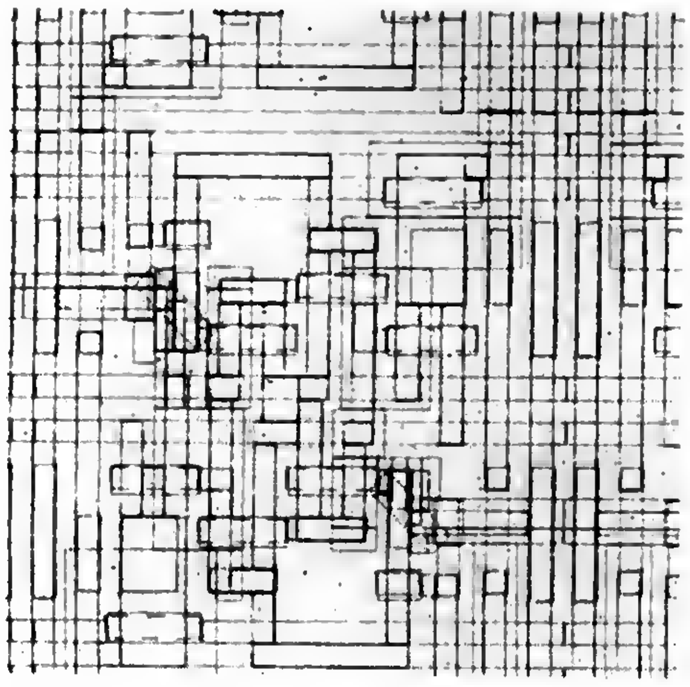


Also, since Arabic reads right-to-left, while the Roman language reads left-to-right, the terminal required a special selector switch to provide both capabilities.

For more details on the 2640 series international terminals, check B on your reply card.



Small and powerful



A life-size section of an intricate, computer drawn plot used in the design process of Hewlett-Packard's new CMOS/SOS single chip 16-bit Micro-CPU.

The XYZs of plotters

We needed a plotting system for our Large-Scale Integration design facilities in Cupertino, California. Our choice: Gerber Scientific Instruments' Superplotter, driven by their choice, an HP 21MX computer.

This computer-controlled plotter draws the line on expensive hand artwork. It offers design engineers the benefits of computerized plotting: flexibility, accuracy, economy, easy interface, and quick turnaround. The heart of the Superplotter, the HP 21MX coordinates and optimizes the plotter's performance to achieve dramatic 0.004 inch accuracy, 42 inch-per-second speed, and 2.8G acceleration.

Automatic drafting machine throughput for most drawings is primarily a result of such high acceleration and speed.

Actual size of HP's Micro-CPU Chip. To ensure exactness of detail, one-ninth of this surface is plotted on a 2½ foot square.

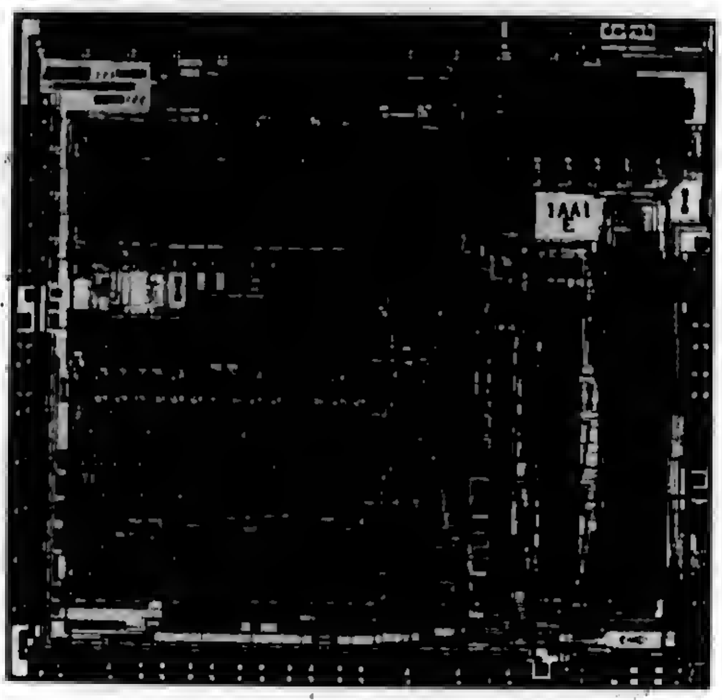
Precision in miniature

In sophisticated integrated chip design, precise measurement and fast throughput are critical for producing mask level artwork.

In our LSI lab, a technician uses a computerized digitizer to produce artwork for the masks of a new chip. Masks are glass plates, each containing the details of one of the chip's eight thin layers.

The technician then loads data corresponding to that particular drawing into the plotter system. Each line is plotted in one of four colors, depending on the material shown.

The finished plot is compared to the hand drawing to verify accuracy; then it's on to manufacturing.



An enlarged photograph of the MC^2 Chip.

Hewlett-Packard's MC^2 chip

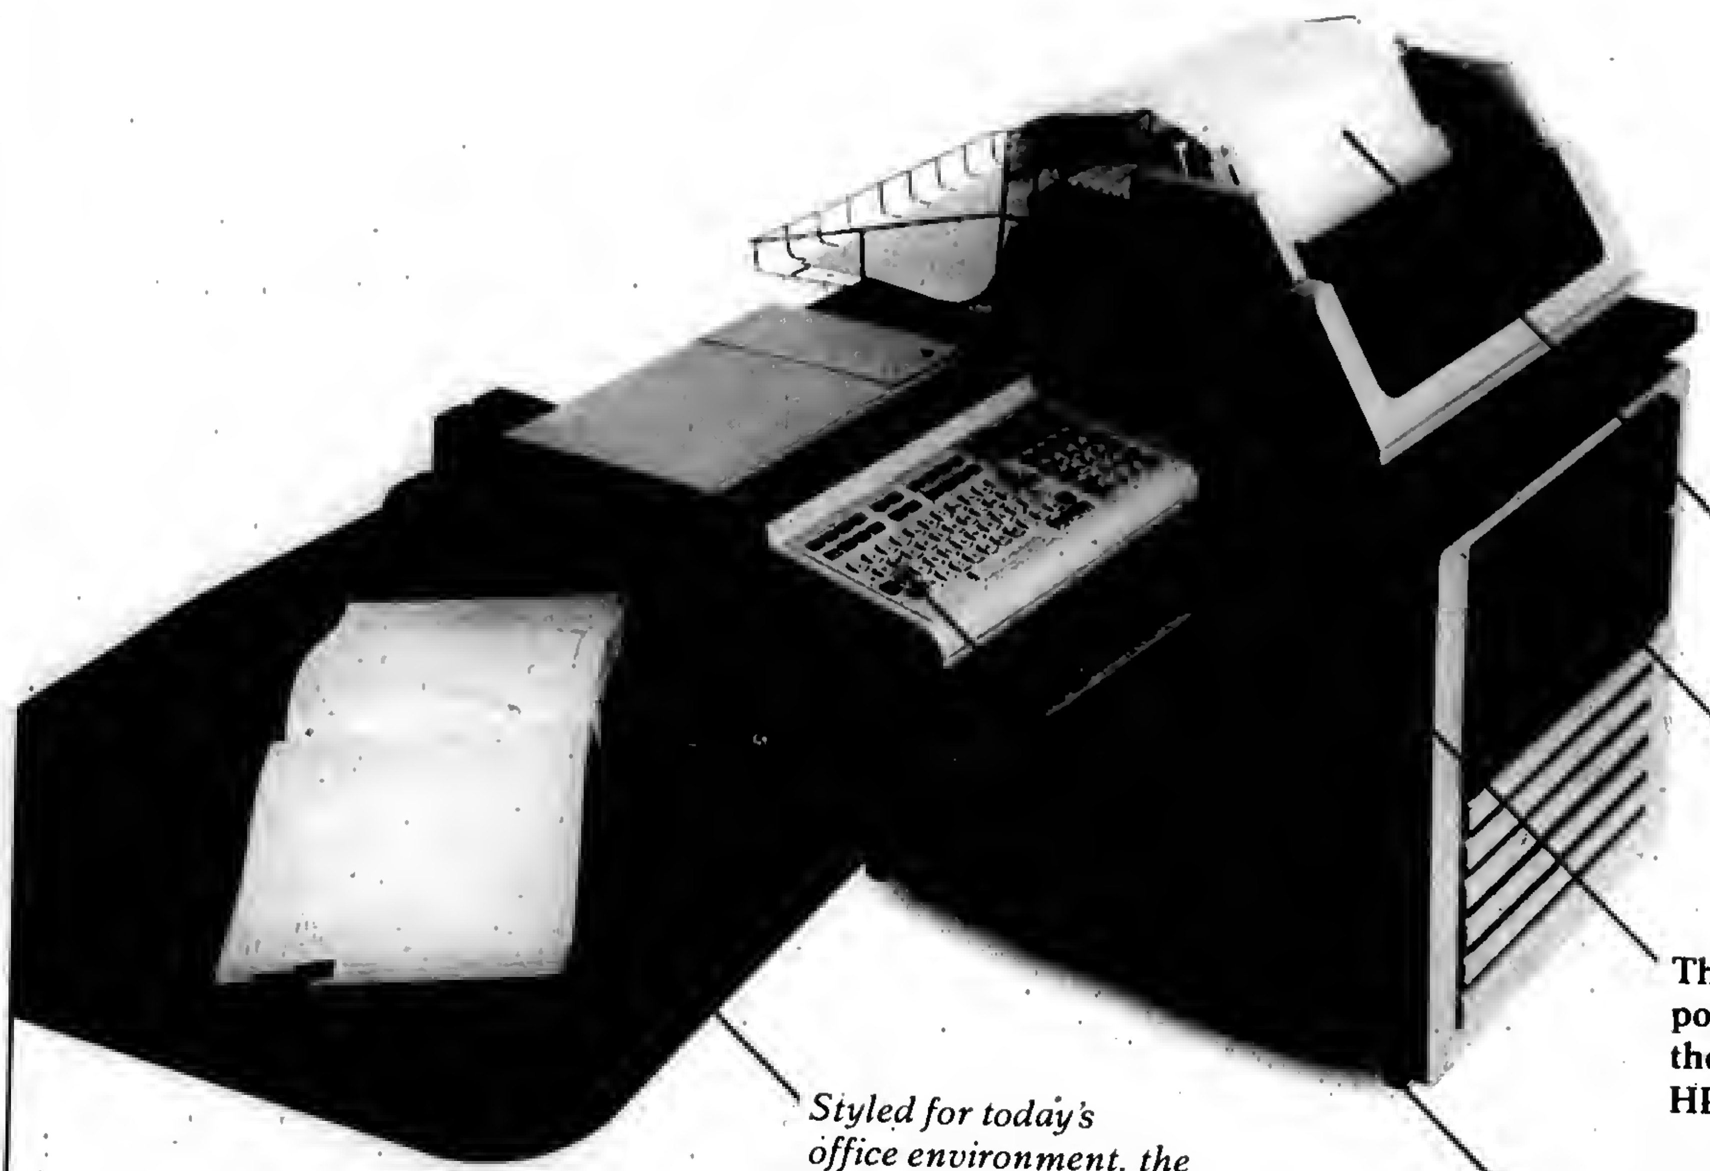
HP's Micro CPU Chip (MC^2) is based on silicon-on-sapphire technology with complementary metal-oxide-semiconductor processing (CMOS/SOS).

With SOS technology, new designs are possible, with far more favorable trade-offs between high speed and low power consumption.

SOS provides superior dielectric isolation, thus circuit elements can be very closely spaced. In only a 34mm² area, MC^2 is a complete 16-bit parallel microprocessor that contains 10,000 transistors.

The MC^2 executes 34 classes of 16-bit instructions and is capable of performing a full register-to-register addition in 875 nanoseconds. Power consumption is typically 350 milliwatts.

Check C on the reply card for more information on CMOS/SOS.



Print typewriter quality reports on standard or custom-designed forms.

Store data on convenient and inexpensive flexible disc memories.

The flip of a single power switch activates the completely integrated HP 9896 desk top computer.

Styled for today's office environment, the HP 9896 has ample work surfaces.

Enter a BASIC program on the keyboard of the high-performance desk-top computer.

The HP 9896 computational system

With the HP 9896, small businesses and first-time computer users have general computational power right at hand, and in their control. Easy to program in BASIC, the HP 9896 has extensive editing capabilities, and programs can be custom tailored to commercial uses: finance, manufacturing, distribution, and sales.

Scientific and engineering applications
The HP 9896 is also a powerful resource for scientific and engineering applications that require analysis and manipulation of technical data in medium-size data bases.

For more advanced applications, the HP 9896 system includes peripheral options—a high-speed (200/1pm) printer and a matrix plotter, for example. You can also expand the memory in increments of 8k bytes up to 32k bytes.

Double density discs
To put more data on-line, HP innovated flexible discs with twice the density of previous industry standards. Each holds nearly 500,000 bytes of information, and as many as four flexible discs can be supported by a system at once, for a total on-line capacity of almost two million bytes.

Full price for the HP 9896 system hardware is $18,700.* HP has an OEM quantity discount schedule. **If you wish further information on the HP 9896, indicate D on the reply card.**

*U.S. domestic prices only

Automate financial accounting in as few as five days*

The HP 9896's new business information management system helps companies with annual sales of $250,000 to $10,000,000 establish their own EDP facility. FICS (Financial Information Control Software) is a complete package of programs to handle general ledger, payables, receivables, payroll, and inventory. Further, HP has an innovative five-day conversion plan that enables qualified* customers to switch over quickly from their manual or ledger card systems.

For larger businesses, the HP 9896 system can also handle selected tasks in such areas as production control, financial analysis, forecasting, and personnel records management.

The Hewlett-Packard customer is assured of a single responsible source. The completely integrated hardware and software package—the HP 9896 and FICS—costs $21,700* and includes installation, conversion, and training. The total system leases for approximately $500/month including maintenance. **To learn more about this advance, indicate E on the reply card.**

*Offer available in the U.S. only; contact your local sales office for more details.

New & Noteworthy

Incremental growth: two Hewlett-Packard products help you grow "byte by byte."

Upward compatible RTE-M

RTE-M is Hewlett-Packard's newest Real-Time Executive operating system for HP 1000 systems and 21MX family computers. Memory-based rather than disc-based, RTE-M is suited for dedicated applications that require fast response time in collecting and controlling data. Minicartridges or flexible discs may be used for program and data storage.

Versatile RTE-M is upward compatible with HP's broad family of larger disc-based systems—RTE II and RTE III. HP lets you choose the system that's right for your present application; and you can expand without high conversion costs or retraining.

RTE-M is available in three modular versions—MI, MII, and MIII—depending on your requirements and hardware resources. RTE-M software is priced at $1750.* **Check F on the reply card for details about RTE-M and RTE II/III.**

DISCoveries

What can be stored on fewer than 100 megabytes of disc memory?
a) The Encyclopedia Britannica from Aardvark to Mustard
b) Enough typed characters to span the Golden Gate Bridge 25 times
c) Materials control and accounting operations of a firm with over 400 employees, 52 products, and annual shipments totaling $42 million.

Guess again. The correct answer is A, B, *and* C. Two 50 megabyte discs offer more memory than you may realize.

Let's visit the company mentioned in "C." Surprisingly, 100 megabytes—the equivalent of two formatted HP 7920 discs—can store much more than the materials control and accounting data bases. There's also system software, applications programs, and plenty of room for growth.

Look at some of the data processed during a typical month:

1200 checks written in accounts payable;
17,000 material vouchers and
4000 labor vouchers processed in cost accounting;
1500 purchase orders and
700 work orders processed in manufacturing;

not to mention daily status reports on inventory levels, backorders, and product activity for
5000 different parts.

Remember... all these data, and more, stream from fewer than 100 megabytes.

This company's disc storage is part of an HP 3000 computer system which utilizes the IMAGE data base management package. The HP 7920's function as integral parts of a totally on-line, integrated system, for a current and close-at-hand data base. Six more HP 7920's—another 300 megabytes—can be added to the original microprocessor-based controller for a total of 400 megabytes.

The HP 7920 add-on multi-spindle version is $14,000, or two for $26,000.* **Check G on your reply card for details.**

Despite 'Lines/Day' Drop

Univac Team Gains Most From On-Line Programming

By Don Leavitt
Of the CW Staff

WASHINGTON, D.C. — It is hard to quantify improvements in programmer productivity attributable to the use of various tools and techniques now available, and improvements don't always live up to expectations. However, the new approaches are worth using, according to Neil Gorchow.

A vice-president for product strategy and requirements at Univac, Gorchow told a session of the recent National Conference on Computer Systems Productivity of a project at Univac in which a combination of tools and techniques were introduced to enhance the programmers' performance.

Overall, the development team did better in many respects than it had when the new approaches were not being used. But, he added, the project still required 50% more effort than had been initially budgeted for it.

Univac, like most vendors and many users, "spends a fortune on software" every year, he said, and this particular project was expected to be substantial, requiring 100 man-months of work.

That estimate took into account gains the company thought it would get from the use of interactive rather than batch-oriented programming environments. It also took into account top-down design and implementation, design reviews, structured programming techniques and the use of higher level language with code reviews.

Determining Effects

The introduction of so many new factors made it slightly difficult to determine the effect of each, but Univac had built up a long file of information about the performance of individual workers on previous projects. This served as a reasonable base for comparison, Gorchow explained.

His notes failed to indicate the nature of the project, but, he said that was relatively unimportant: the estimates were based on whatever the work was to be.

In any case, by the time the project was finished it provided some mixed results — not the least of which was the need for 150 man-months of work to get it done.

The interactive programming environment provided the greatest boost to productivity, he said, perhaps because of the unexpected boost in the development team's morale. In the old batch mode of operation, team members were promised — and generally received — two "shots" a day on the system.

Working at the CRTs, they were free to access the system whenever they wished. By the time the project was done, they averaged four or five shots a day, Gorchow estimated.

Although Gorchow claimed a 20% gain from use of on-line program development, he later mentioned that the "lines of completed code/day" productivity measurement actually dropped on this project from 8 to 6.5. This was confusing to those running the project since they expected the count would go up in the new environment.

But Gorchow gave a clue on what may have happened when he noted the design reviews were "very helpful" because they avoided ambiguity about where the project was headed. Despite the dropback in lines completed, the end product was done sooner than it would have been if the old techniques had been used.

And, Gorchow emphasized, the stability of the finished product was greater than expected — "probably because the end users understood what they had," thanks to the design reviews.

The use of higher level language — Plus, in this case — provided the second greatest improvement in productivity, but the Univac official admitted he was disappointed the gain from this area was only 10%.

Working with the more English-like wording of this coding "drastically reduced errors and eased debugging," he said. "It also divorced the implementation from direct hardware considerations."

The use of top-down design and implementation techniques was the third most significant factor in this project, he continued, noting it "forced a foreknowledge of purpose, forced modularity and minimized integration problems."

In fact, however, the real impact of top-down design and structured programming could not be measured at development time. If all goes well, the payoffs from these approaches will show up more in simplified maintenance than in simplified original coding, he explained.

'JCLMacs' Standardizes OS Job Stream

VALLEY FORGE, Pa. — JCLMacs from Management and Computer Services, Inc. (Macs) was developed as an aid in producing completely standardized JCL statements for IBM OS or OS/VS environments. The ouput is so standardized, "it really is pretty," according to a Macs spokesman.

"Prettiness" is immaterial, of course, but he claimed the standardization is useful as well. It means that systems programmers, for example, can review procedure libraries easily when changes that may affect numerous systems are being considered, he explained.

The package can be run on any computer with enough memory and an ANS Cobol compiler, he said. It will accept OS JCL, utility control cards and JCLMacs cards intermixed to produce output in the same sequence as the input, substituting generated JCL for the JCLMacs cards.

A listing is produced showing each input card and the output generated from it. Errors are indicated by asterisks under the incorrect data and output JCL is formated into a standardized alignment and may be sequenced in columns 73 to 80, the vendor said.

If SORT is specified as the program to be executed, DD statements for all data sets except SORTIN, SORTOUT and SYSIN will be generated by the system, the spokesman noted.

JCLMacs includes a table-driven facility so frequently used JCL can be generated without coding JCLMacs cards. They can be extracted from the table and added to a procedure by a simple reference to its number in the table, he explained.

The package uses 65K bytes in an IBM DOS environment but, since Cobol source code is provided, it should be able to run in any comparably sized CPU that supports Cobol, he added.

The software costs $1,000 from Macs at 790 Valley Forge Plaza, Valley Forge, Pa. 19482.

'Easytrieve' Code Studies SMF Data

OAK BROOK, Ill. — Pansophic Systems, Inc. has begun distributing an SMF reporting system for IMB OS/VS1 users built around Pansophic's Easytrieve package.

The enhancement — free to Easytrieve users — organizes an SMF variable block data base into a "more easily handled" fixed block format, the company said.

The reporting system is made up of five Easytrieve programs that produce the reformatted SMF data base and two more programs that generate daily and periodic reports, including file management information, a spokesman explained. The system deals strictly with Type 4, 5, 6 and 20 SMF records, he added.

The formats provided can be adapted to users' special report headings and various accounting needs. Any job or job step can be singled out for analysis and, since the created file is sequential, it is easy to use.

While the SMF reporting system is available to all current Easytrieve users, it is also ready for distribution to new users of the $15,000 package, Pansophic noted from 790 Enterprise Drive, Oak Brook, Ill. 60521.

Use of Fortran as Source Code Lets DBMS Run on 'Any CPU'

PHILADELPHIA — Seed, a low-cost "Codasyl-type" data base management system (DBMS), was written primarily in Fortran so it could be installed on "virtually all machines," according to the vendor, International Data Base Systems, Inc.

While many DBMS cost so much they must be used across a spectrum of the user's applications, Seed can be justified on the basis of a single application, the vendor claimed.

The $7,500 software includes both a data definition language to specify what goes into the data base and a data manipulation language (DML) to work with the data once it is in place. Seed's DML can be used from Cobol or Fortran programs, a spokesman added.

The system supports network, hierarchical or network data structures providing both schema and subschema views of the data, as defined by Codasyl. Changes in the data or in relationships would require restructuring of the data base, but changes in the user's view of the data can be provided through creation of new subschemas. In either case, existing programs are not affected by changes in the data, he said.

Optional Extension

The DML facility can be extended with an optional interactive interface called DBLook, which serves three purposes. First, it allows the user to build a custom query language to support immediate retrieval of data, the spokesman explained.

But it also allows the user to examine the structure of the data base itself, to better understand what data types and relationships, for example, are being used.

Finally, DBLook also provides an interactive "HELP" facility to explain commands to the user, he added.

Seed has already been implemented on IBM 370 and Digital Equipment Corp. Decsystem-10 systems.

The basic DBMS costs $7,500 or $375/mo, the vendor said from Suite 252, 3508 Science Center, Philadelphia, Pa. 19104.

UK-Built 'Necol' Eases Neat/3-Cobol Conversions

CLECKHEATON, England — The Neat/3 to Cobol Language (Necol) converter developed by Computer Facilities Software Ltd. (CFSL) is now available in this country and will be available in the U.S. once an agent is selected, according to a CFSL spokesman.

The software is said to provide direct disk-to-disk conversion of source programs written in NCR's unique Neat/3 language, recoding them in code compatible with the 1974 ANS specifications for Cobol which can then be compiled on NCR's 8000 series or Criterion CPUs.

While conversion is under-way, Necol produces a source listing of the Cobol statements being produced. Any Neat/3 statement that cannot be converted is identified on the listing and carried to the new Cobol program file as a comment line, so the user can see what work still has to be done manually.

Nonconversion occurs particularly when Necol encounters "Level 2" instructions, the RELINK tag and chained disk files, the spokesman noted, since there are no corresponding Cobol facilities for these Neat/3 capabilities.

In addition, he said, all printer records, work areas and WRITE statements must be recoded by the user because of differences in Neat/3 and Cobol handling of such things as spacing before or after printing.

PERFORM statements "must be closely reviewed" because of differences between that Cobol instruction and the Neat/3 LINK. Numeric literals are converted with enclosing quotation marks which must be removed in Cobol, he added.

More information about the software or about the agency arrangement the company would like in the U.S. is available from CFSL, Braemar House, Snelsins Road, Moorend, Cleckheaton, West Yorkshire, England.

More Cobol Soon

DAYTON, Ohio — NCR Corp. has released an ANS Cobol 74 compiler for use with the N-mode models of its 8000 series CPUs. Comparable compilers for I- and V-mode processors were released earlier so there is now Cobol compatibility throughout the series, a spokesman noted.

Other compilers available with the 8000 series include Neat/3, Neat/VS, Fortran, RPG and Basic.

Systems accommodating the NCR Century Software (NCS) Cobol 74 compiler include the N-8350, N-8450 and N-8500 configurations, as well as the older Century systems, the spokesman said. The minimum system required for the compiler is 32K bytes of memory, printer, two disks and card, tape or cassette input unit.

The N-mode Cobol compiler will be available soon for a monthly license fee of $90.

'Alice' Shifts CICS Macros to Command Format

HAWTHORNE, N.J. — Designed to help convert the macro-level coding required by earlier releases of IBM's Customer Information Control System (CICS) to the command-level mechanisms available under CICS/VS Release 1.3, the Application Language Interface Conversion and Extension (Alice) system has been introduced by On-Line Software International (OSI).

The software works as a batch mode precompiler run. It accepts the user's Cobol source program as input and generates a new source program updated in the way it interfaces with CICS but undisturbed in its basic logic, according to an OSI spokesman.

The macro coding is converted to command-level instructions whenever possible, he said, and when a change cannot be made — some of the macros have no equivalent in the new command structure, he noted — the remaining macros are flagged on the program listing which is also generated.

'Leaving macros in place does not affect the program since CICS 1.3 accepts them as easily as it accepts the command formats, the spokesman claimed. The changeover is made, when possible, primarily for the convenience of the programmer, he said.

Obviously the conversions could be done manually, he admitted. By putting Alice to work however, an installation's entire conversion can be handled quickly and uniformly, he claimed, relieving the local staff of the effort and the need to maintain two different environments, as would be the case if manual conversion took a lot of time.

Alice will be available Aug. 1 for $750, but requests for the package received prior to that date will be discounted 20%, OSI said from Suite 208, Software Plaza, Hawthorne, N.J. 07506.

NOVA/ECLIPSE/PDP-11 Users

FORTRAN DEBUGGING with TRACER

TRACER is a fully symbolic, high-level debugging tool for Fortran Programmers which offers these advantages:

- displays values as they change, statement labels when executed, subroutines when called, etc.
- eliminates machine language considerations thereby reducing programmer effort
- speeds debugging
- increases programmers productivity
- reduces need to expand facilities and staff to increase program development

Available Now - $1200.

TRACER is one result of Information Processing Techniques continuing effort to provide program development and debugging tools for minicomputer users.

payroll limping?

Too many small programs . . . Too many read/writes of old fashioned segmented records . . . Too many discrepancies between redundant master files . . . Too many interface programs that don't interface . . . Too much thrashing of old fashioned code . . . Too many half-astute answers to today's EEO, OSHA and ERISA needs . . .

Sounds like you should discuss up-to-date Payroll/Personnel/ERISA software for your 360/370, Burroughs, Honeywell or Univac, with Joe Nestor (617) 851-4111, Wang Laboratories, Inc., Lowell, MA 01851. In California, call Carl Tarascio at (714) 631-0138.

WANG

'SAS' Eases Load Module Chores

RALEIGH, N.C. — Release 76.5 of the Statistical Analysis System (SAS) software is said to provide "substantial savings" for IBM OS/VS users that need to copy load module libraries to disk or tape. The PDSCOPY procedure eliminates the need for relinking and provides reblocking as it copies, according to the SAS Institute.

SAS is a unified system for data management, statistical analysis and report writing, a spokesman explained. The PDSCOPY feature can save users 13% to 18% over conventional methods of copying load modules, he claimed, adding it would be of immediate use to installations upgrading to IBM 3330 or 3350 disk packs.

The updated system also supports tape-based SAS data sets, time and date functions and a procedure to produce overprint contour plots. A format procedure to print value labels and statistical procedures for outputting selected percentiles and for performing one-way non-parametric analyses are also part of Release 76.5, the spokesman said.

Written in Assembler and PL/I, SAS runs in batch or TSO modes or in autobatch under Hasp and requires a user region of 150K bytes. It can be used on IBM 360/370 or plug-compatible machines.

The software is available as a one-year renewable lease with a first-year cost of $2,500.

The SAS Institute can be reached through P.O. Box 10066, Raleigh, N.C. 27605.

'Reccon' Monitors Data Base Duplicates

LEXINGTON, Mass. — The Reccon package enables users working with data base management systems or central information files to recognize and consolidate duplicate accounts, according to the vendor, Systems Design & Implementation, Inc.

Many organizations, including banks and hospitals, may wish to allow separate accounts to cover separate types of services, for example, but still maintain centralized awareness of all accounts that pertain to one person or customer. Reccon supports that need specifically, a spokesman said.

In reviewing files, the package identifies those customer names and addresses most likely to be duplicates. They are displayed to a clerk with an "optimum choice" selected by Reccon based on both account and customer identification data.

Typically, the clerk needs to make a different choice in only 15% of the cases, the spokesman said.

Reccon is written largely in Cobol and runs in "about 100K" on IBM gear, but has been installed on Burroughs and NCR mainframes as well, he added.

The software costs $30,000 plus installation charges the first year and $12,000/year after that. Installation charges generally are about $6,000, the company said from 20 Lillian Road, Lexington, Mass., 02173.

Linear Programming Extended on UCS Net

KANSAS CITY, Mo. — Two linear programming systems — the Advanced Linear Programming System (Alps) and Transportation, Allocation or Distribution (Trad) — are available through the Uninet remote-computing network of United Computing Systems, Inc. (UCS).

Alps applies to production scheduling, investment analysis, industrial management, process control, capital planning and task allocation problems in which any or all the variables may be restricted to integer values.

Trad was designed for optimizing industrial processes involving the transportation, allocation or distribution of products, UCS' business/financial product manager said from 2525 Washington, Kansas City, Mo. 64108.

'DCS' on First Data Net Aids Study of Mechanisms

WALTHAM, Mass. — The Dimensional Computation System (DCS) now available on First Data Corp.'s remote-computing network makes mathematical models of "almost any kind of two-dimensional mechanism or assembly of parts," according to a spokesman.

The system includes a language for describing how the parts of assembly are attached to one another. The important features of the individual parts are also described in a very simple way, relieving the user of having to do any arithmetic or trigonometry, he added.

Headquarters for the nationwide First Data network is at 40 Second Ave., Waltham, Mass. 02154.

Fortran Tests Offered

User Involvement Called Key to Compiler Validation

By Edith Holmes
Of the CW Staff

DALLAS — Validation services and standards for software must go right down to the user level or they won't do any good, Patrick M. Hoyt of the Federal Cobol Compiler Testing Service told a recent conference audience here.

In an effort to encourage users to participate in a developing Fortran compiler validation system, Hoyt offered to test any compiler a user sends him for conformity to American National Standards Institute (Ansi) specifications.

Software standards are the only reasonable means of bringing down software conversion costs, Hoyt believes. "Standards issues have to be hit hard — by users" if the community is to put an end to dumping huge amounts of money down the conversion drain, he stressed.

The Navy's Fortran validation program measures a compiler's conformity to Ansi's 1966 Fortran standard, X3.9, he noted. That standard is currently under review by the voluntary body's Fortran standard committee and users will soon have another opportunity to comment on the 1977 update of X3.9, Hoyt said.

Procurement Aid

Containing Fortran programs, subprograms and an executive routine, the validation system is intended to help the government procure standard Fortran compilers in hopes of developing interchangeable programs which would, in turn, reduce expensive system conversions, Hoyt explained.

Hoyt believes the validation service has already proved to be "a useful procurement tool." And the improved performance of Fortran compilers will enable the programs produced by them to make the jump from one machine to another more easily, he said.

"If vendors tested their software adequately, we wouldn't need to run the validation service," Hoyt stated. "We could accept programs and compilers on blind faith."

Vendors' cooperation in testing and debugging their software has improved since the government began its validation services, first in Cobol and now in Fortran, Hoyt added.

In constructing its validation system for Fortran, the Navy concentrated on writing "positive tests," he assured his audience. The service is strictly a syntactic and semantic test of the language elements contained in and defined by the Ansi standard.

The service's information tests were initiated to be of help to users. The system tests neither vendor extensions of the Ansi specifications nor compiler or object code efficiency, Hoyt stressed.

Basic Service Coming

The Navy has gained considerable experience in running the validation services designed so far. A system for Basic is now in draft form and will be available in the near future, he indicated.

While he chastised users for their lack of involvement in software standard-setting, Hoyt praised Ansi's Fortran committee for its dedicated work in the last 11 years. The National Bureau of Standards (NBS) has also made considerable contributions in the area of federal standards, he noted.

NBS might also take the lead in developing "a federal charter for Fortran validation," Hoyt said. "We need to put teeth in our message to vendors to end the nonconformity problems and outright errors of Fortran compilers and programs."

Ansi is likely to charge $15 a copy for its forthcoming draft revision of the 1966 Fortran stan-

(Continued on Page 36)

Correction

The Fortran program developed to calculate the economic thickness of industrial insulation [CW, June 13] costs $60, according to a spokesman for the Thermal Insulation Manufacturers Association, 7 Kirby Place, Mt. Kisco, N.Y. 10549.

SYSTEM 2000
Puts your resources to work

Data is a valuable resource. Without proper management, its usage becomes inefficient and impacts the productivity of your other corporate resources.

MRI's SYSTEM 2000 can put your data to work, can make it serve your company in many, many beneficial ways, and can take some of the workload off those other valuable resources.

SYSTEM 2000 is a versatile data base management system designed for users of IBM, CDC, Univac, and Amdahl computers. Working with a wide variety of applications, with data bases ranging from 300,000 to more than 1.5 billion characters, with non-data processing personnel as well as highly-skilled programmers, SYSTEM 2000 provides flexibility and efficiency in even the most complex environment.

To find out how hardworking your resources can be, contact our nearest marketing representative or MRI corporate headquarters. Find out how resourceful and hardworking our people are in ensuring that your needs are met. Ask about the new DOS/VS version and CONTROL 2000, MRI's data dictionary.

Put your resources to work . . .
and take advantage of ours.

Measurement Can Be Based on Local Needs: Stimler

By Ronald A. Frank
Of the CW Staff

PHILADELPHIA — The difficulty in measuring the performance of a DP system comes from the lack of an accepted standard of measurement, according to Saul Stimler, president of Stimler Associates.

Productivity or performance measurements must be geared to individual systems; it is up to the user to first decide what given workload is to be expected from the system, Stimler said here recently.

After that, he noted, there is a guideline against which to measure whether the desired results are being achieved.

The workload of a typical DP system is usually based on the amount of work it can and should complete in any given work day and its ability to complete individual jobs in a timely manner, he pointed out.

It is best for the user to establish a representative workload that can be an expected mix for a given day. This should include a multiple mix of transactions processed by the system and take into account traffic peaks, Stimler said.

"Since there is no universal unit of work, you can only relate a certain workload to a specific system," he added.

To determine the maximum limit of a system, it is usually possible to calculate the maximum jobs per hour that can be handled to meet the required turnaround time. Once this has been determined, the user will have a good idea of which part of the system will be the first to become deficient, he said.

Stimler said that monitors, both hardware and software, are tools for the user to determine how much of the total available resources is being utilized at a given point. This process will also help to determine which resource will become saturated first if the system keeps running similar job mixes, he added.

The goal of performance measurement should be to find methods by which the system can do the same amount of work in less time; alternatively it should provide answers on who the system can take on new tasks in the same time, Stimler said.

Meeting these goals means the user is optimizing the performance of his system, he stressed.

The user should carefully analyze the system before beginning a measurement project. A common dictionary of terms should be agreed upon so there will be no semantic differences, Stimler suggested.

It is better to call these common terms a tentative glossary rather than referring to them as a standard — simply because persons become hesitant to accept anything that is labeled a standard, he advised.

In a typical medium-scale installation, a three-person staff would be required to do a performance measurement operation. This should include one manager that can communicate with corporate representatives and two technical persons, Stimler said.

One of the latter should understand how the firm conducts its business because this is important to a successful analysis of the DP methods employed, he added.

The group should make an estimate, which sometimes is little more than a guess of how much system improvement can be attained. After that the assumption should be tested to see whether it is realistic, he said.

Performance people are still suspect wherever they go and whatever they do, Stimler said, but DP costs are a significant part of company budgets, so performance improvement is still very worthwhile.

Help Wanted

REXDALE, Ont. — The Canadian Standards Association (CSA) Committee on Programming Languages is trying to determine the need in Canada for standards on RPG-II and PL/I.

People with experience in these languages and managers of DP installations using them are invited to make their views known, a spokesman said.

Anyone willing to serve on a committee and take part in the standards work should contact H.Z. Rogers, Standards Administrator, CSA, 178 Rexdale Blvd., Rexdale, Ont M9W 1R3, Canada.

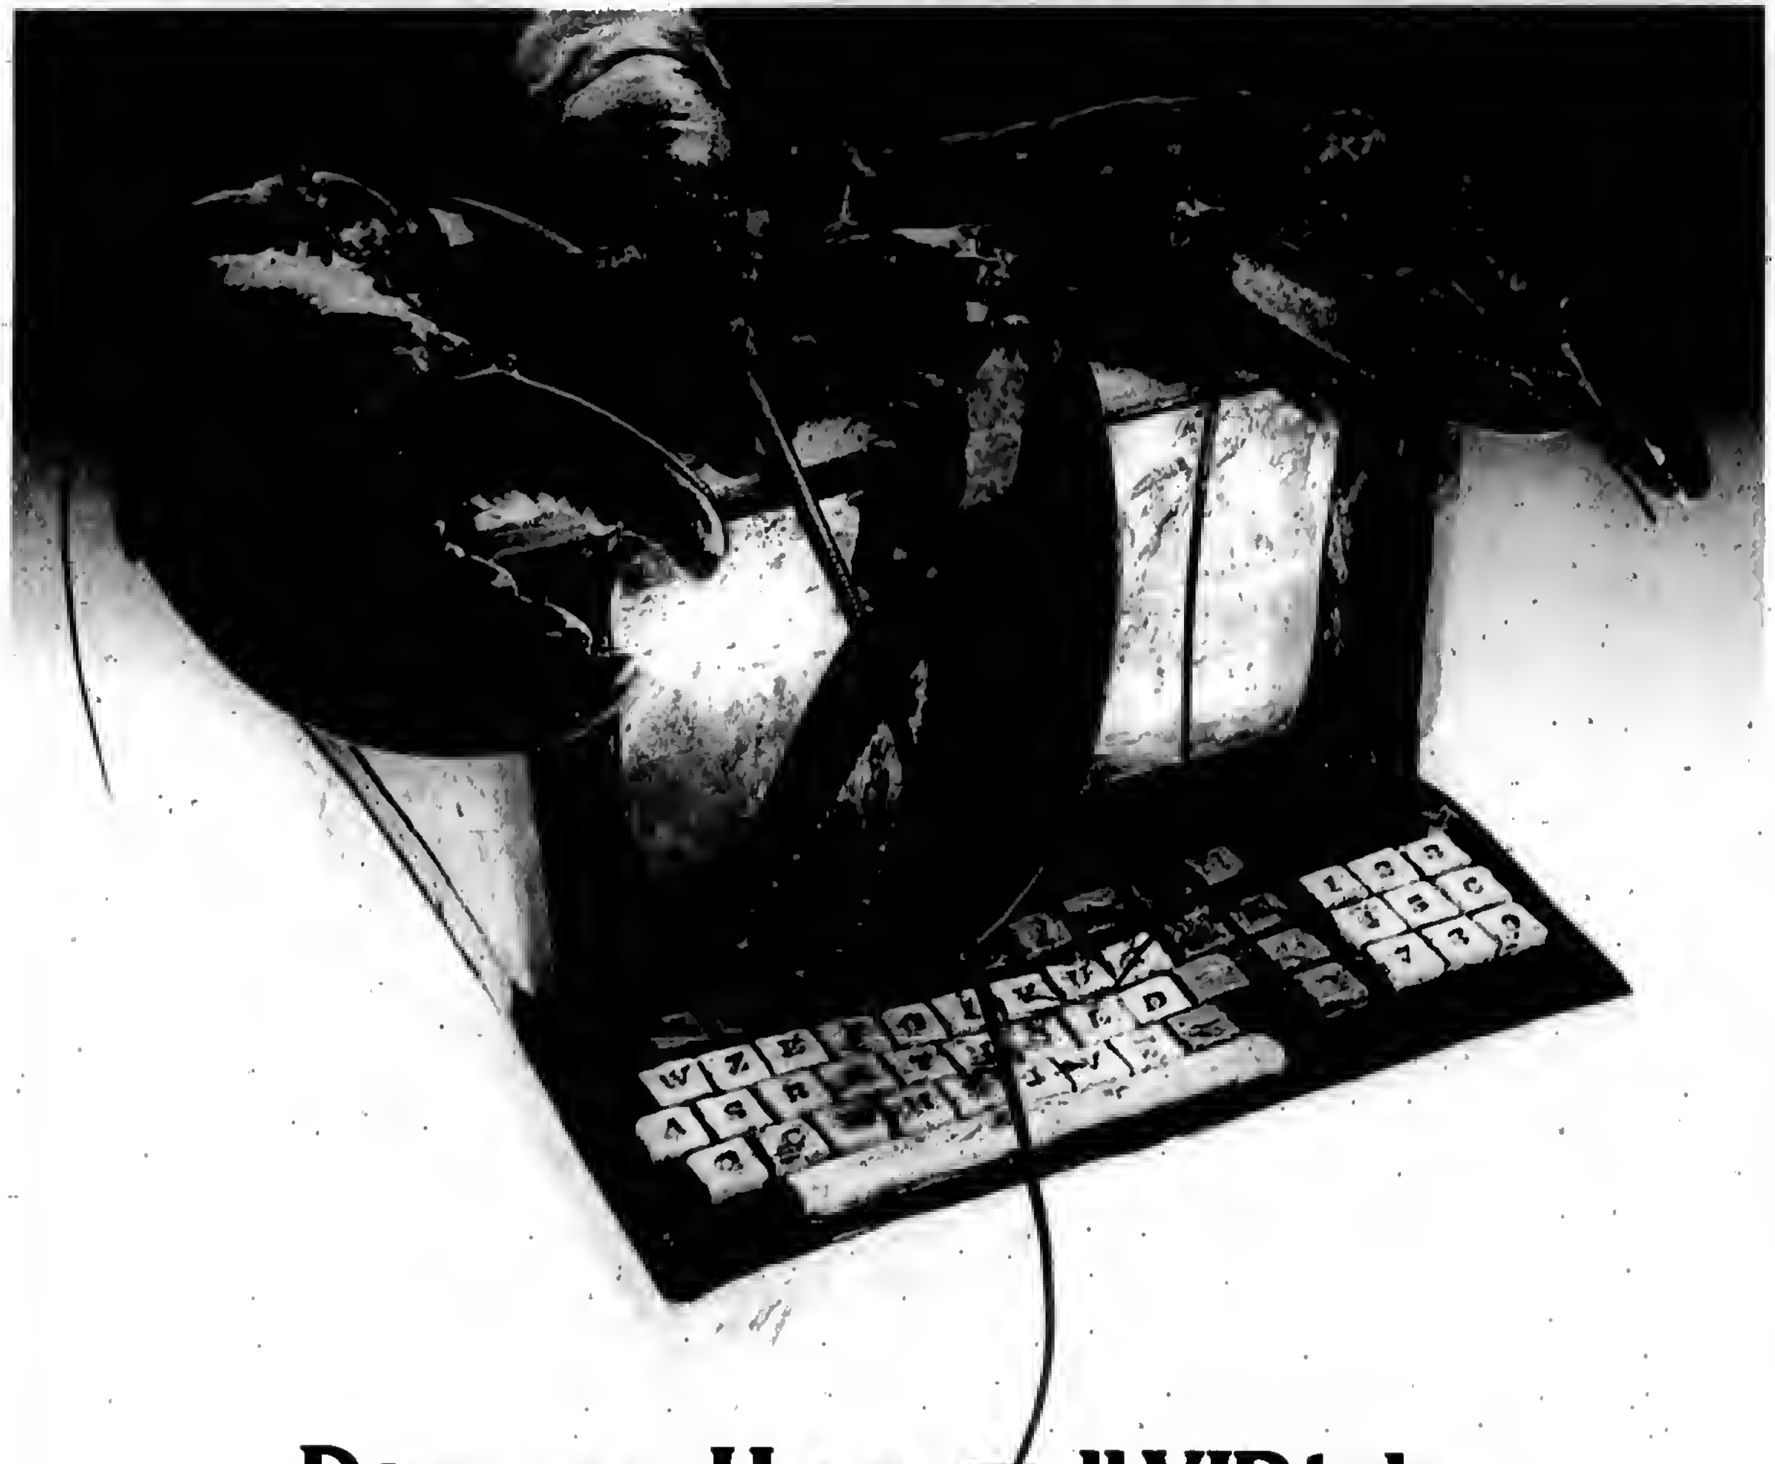
Service Offers Fortran Tests

(Continued from Page 35)

dard, Hoyt noted. The standards body is "petrified that users will participate in the comment period and delay the standard," he said, "but user participation is crucial."

Another area demanding attention is the creation of standard language interfaces to data bases, Hoyt stated. Again, the impetus behind this move is cost.

Users sending their Fortran programs and compilers to Hoyt for testing should include all the documentation they have on the software and address it to Patrick M. Hoyt, Federal Cobol Compiler Testing Service, Department of the Navy, Washington, D.C. 20376.



Does your Honeywell VIP take a big bite per byte? Our Harris 8770 doesn't.

Our new Harris*8770 can do everything your Honeywell 7700 or 775** can do—yet ours costs 10% to 30% less.

That's not all.

When you call us, we respond. For example, our average response time for maintenance is less than three hours. And you can understand why. Terminals are the only things we design, make, install and service. They're our entire line, not just a small piece of it. Stands to reason we give terminals all our attention.

And that's not all.

We build communications monitoring capabilities and self-test programs into our terminals. This not only lets you detect system failures and debug new applications. It also helps isolate any problems in your front end, communications lines, modems, terminals or printer's basic operations.

Result? A lot less downtime But even that's not all.

Harris terminals run without glare, heat, noise. They're lightweight, compact, trimly designed. Easier to work with, look at, move around.

Harris terminals. They help you fight the big-cost bite. Why not phone or write for details and a demonstration? **Harris Corporation, Data Communications Division, Daniel Webster Highway South, Nashua, NH 03060. 603-885-6685.**

Data Briefs

Fiber-Optic Communications Subject of Free Booklet

W. BOYLSTON, Mass. — The raised floors in computer rooms and error-checking hardware and software may become things of the past through the use of fiber-optic cables, according to a booklet from Valtec Corp. here.

"An Introduction to Communication Fiberoptic Design" is a 20-page illustrated text prepared and authored by the manufacturer's staff engineers and scientists.

The publication provides a brief history on the subject of fiber optics, presents the advantages of the light medium and briefly discusses initial costs, hardware savings and typical applications.

The introductory brochure is available free of charge from Valtec's Fiber Optics Division in W. Boylston, Mass. 01583.

Tau-Tron Adds Generator

N. BILLERICA, Mass. — Tau-Tron, Inc. has added a UHF data generator to its TMI product line for testing communications networks.

The MG-15 is a quarter-size plug-in module providing a serial data output at clock rates up to 500M bits, according to the company.

Programming is accomplished by front-panel toggle switch operation; the word length can be selected to either 15 or 16 bits.

The MG-15 sells for $3,300, a spokesman noted from 11 Esquire Road, N. Billerica, Mass. 01862.

Norland Has Data Analyzer

FORT ATKINSON, Wis. — Norland Instruments has announced the availability of the 2001A/6500, a 100-mHz waveform and data analysis system.

The system is comprised of the Norland 2001A data analyzer and the Biomation, Inc. 6500. It can capture signals at acquisition rates up to 500 mHz with 6-bit resolution, Norland stated.

The system costs $33,995, a spokesman noted from Rte. 4, Norland Drive, Fort Atkinson, Wis. 53538.

UDS Registers DAA

HUNTSVILLE, Ala. — Universal Data Systems, Inc. (UDS) has introduced the 1001F Data Access Arrangement (DAA) that conforms with the Part 68 long-form registration process of the Federal Communications Commission (FCC).

The 1001F has an RS-232C interface, can withstand up to 100m amps of dc line current and features automatic overload protection, UDS said. It costs $145 from 4900 Bradford Drive, Huntsville, Ala. 35805.

Told to Circumvent Restrictions

Multinationals Given Grim View of Overseas Nets

By John P. Hebert
Of the CW Staff

DALLAS — Data communications managers in multinational corporations that plan to implement or expand overseas networks might have to circumvent the physical and political hornet's nest of restrictions awaiting their efforts, two representatives of U.S.-based multinational companies and a British consultant on multinational communications stated at a recent conference here.

The problems include political restrictions on the type of data sent across national lines, restrictions on any data being transmitted, incompatibility of communications hardware and software and economic hindrances — compared with the relative ease of implementing a network in the U.S., the three panelists agreed.

The two major problem categories users will encounter overseas are regulatory restrictions and tariffs imposed by the government-run communications carriers and their resulting high costs, according to David Hebditch, a consultant with Expertise International in England.

A voice-grade leased circuit between Frankfurt, Germany, and Brussels, Belgium — a distance of only 180 miles — costs $20,000 per year, Hebditch said. A 200-mile link between London and Amsterdam costs about $15,000, while a voice-grade circuit between Geneva, Switzerland, and Stockholm, Sweden costs $35,000 annually.

In the U.S., however, 180-mile leased voice-grade lines cost $1,000 each for the first two and $2,000 for the third, he noted.

The cost of overseas services is exorbitant because they cross national boundaries and because the European Postal Telephone and Telegraph (PTT) authorities are "money-hungry organizations" that are short of capital, Hebditch said. Illustrating this last point, he pointed out that leased voice-grade lines between London and South Africa cost $160,000 each year, for example.

The cost of the same type of link would cost users $100,000 annually if the communications were routed differently to bypass "a certain country in Europe," he said.

When implementing a communications network in Europe "be well advised by somebody [there] because it will save you an awful lot of money," Hebditch urged.

Long Lead Time

James Hale, manager of corporate DP planning for the Coca-Cola Co., also advised users to make use of services provided by the major international record carriers located in the U.S. The only problem with this approach, he added, is finding the person or people qualified to identify and discuss the major pitfalls.

It is much easier to transmit data from the U.S. to overseas locations than try to transmit between two adjacent countries overseas, especially between developing nations, Hale said.

The Coca-Cola conglomerate was quoted a lead time of 18 months to install a leased line between Johannesburg, South Africa, and Kenya. In addition, the company was informed the carrier could not guarantee a constant transmission speed on the link once it was established and, if a failure occurred during the rainy season, the mean time to repair would probably be eight weeks, Hale explained.

Dedicated Mini

The company circumvented this situation by placing a dedicated minicomputer in Kenya rather than transmitting information from a terminal to the CPU in Johannesburg, he noted.

Another way to bypass such obstacles, Hale continued, is to use an International Telex service, but even that, too, poses restrictions for the user. It is possible to use the service through a Western Union International domestic switch to make the different transmission codes compatible, he added.

Packet switching will be the best answer with the most promise for the low- to medium-volume international user's needs

(Continued on Page 38)

List of IBM-Compatible Hasp Workstations Grows

●Comten 7780, 7781 Debut

ST. PAUL, Minn. — Comten, Inc. has introduced two IBM 360/20-compatible Hasp multileaving workstations designed to work with Comten 3650 and 3670 Communications Processing Sytems (CPS).

In its basic form, the Comten 7780 consists of a 600 card/min Comten Model 7305 reader and 600 line/min Model 7406 printer. The 7780 also offers its user the option of sharing a Model 4008 system console for operator communications, according to the company.

The 7781 batch terminal workstation, which includes the card reader and the line printer, also has its own dedicated Model 4008 operator console.

Either configuration can be expanded to include up to six additional card readers and six more line printers. Workstation control can be provided by adding a multileaving adapter module and a multileaving workstation emulator to existing network control software, Comten said.

Sharing the resources of the Comten CPS reportedly eliminates the need for separate remote batch terminal control hardware.

All of the Hasp software for the workstation resides in the CPS. Network control procedures for full-duplex communications are supported on the remote CPS, according to a spokesman.

The 7780 costs $29,000 or $1,110/mo and the 7781 is priced at $32,500 or $1,256/mo in its basic form. The CPS ranges from $50,000 to $125,000, depending on configuration.

The workstations are scheduled for delivery by mid-September, the spokesman noted from 1950 W. County Road B-2, St. Paul, Minn. 55113.

●Raytheon Enhances PTS-1200

NORWOOD, Mass. — Raytheon Data Systems Co. has introduced a software enhancement which allows its PTS-1200 distributed processing system to perform the functions of IBM 360/20 remote job entry workstations.

In addition, the company added a security badge reader to its PTS-100 series of programmable terminal systems.

PTS-1200 enhancement permits Raytheon users at remote sites to communicate with such IBM spooling programs as Hasp, ASP and JES while concurrently interacting with the host on a transaction basis under IBM 3270 protocol and performing a variety of local tasks, according to Raytheon.

The workstation capability allows PTS-1200 users to access the capabilities of a host mainframe regardless of the mainframe location. Through commands entered from a system console, users can control the I/O operations of multiple remote peripheral devices, the company claimed.

Punched card data or data keyed onto disk or tape from PTS-1200 CRTs can be transmitted to a host and entered into the host system queue, with processed data returned to specified devices under control of a set of utilities written in Raytheon's Macrol programming language, according to the firm.

PTS-1200 terminals with the enhancement can handle both batch and interactive communications jobs. Terminals on the same system can handle both of those jobs at the same time, while other terminals are used to enter data, validate data, inquire into local files or initiate local processing jobs, a Raytheon spokesman noted.

The Raytheon systems support Binary Synchronous Communica-

DEALERS... AJ WANTS YOU

Anderson Jacobson, a leading manufacturer of data communications products, would like to introduce you to our new minicomputer, the AJ System 1500. And we need your expertise to make our small business system successful.

Here's what we have to offer:

- Good margins
- Exclusive territories
- A small business nucleus of application software at *no charge* to you
- Excellent client accounting software, also at *no charge*
- A multi-programming, multi-terminal system that is *fully* expandable
- AJ field service available in selected areas of the United States
- Floppy or hard disk systems

If you are interested in being a part of AJ's successful future, call or write Bob Reed, National Marketing Manager, for more information.

San Jose, California 95131 • (408) 263-8520

Data Trap Features Micro, CRT Monitor

PROVIDENCE, R.I. — International Data Sciences, Inc. (IDS) has introduced the Hawk 4000, a microprocessor-controlled data trap with a CRT monitor to help diagnose data communications problems.

The company also brought out two additions to its Series 8500 Minitech product line; the 8508 audio generator and monitor and the 8554 selector switch and monitor module.

The IDS Hawk 4000 Datatrap can interactively transmit and receive data between a modem and a terminal and display the data on a 9-in., 512-char. screen, according to the firm.

A total of 2,000 characters can be trapped and stored for later recall and study, IDS added.

The Hawk operator issues commands using a 16-key alphanumeric keyboard. All switches are stored in memory, the firm stated.

The monitoring system can operate with Binary Synchronous, Synchronous Data Link Control, Higher-Level Data Link Control and all Advanced Data Communications Control Procedures protocols, according to the company.

It handles full-duplex, asynchronous transmission rates from 75 bit/sec to 19.2 kbit/sec and synchronous speeds to 75 kbit/sec. Transmit and receive data can be displayed interleaved by character, by row or on a split screen, IDS stated.

Ascii, Ebcdic and hexadecimal formats are standard in the Hawk, which IDS said costs $9,975.

The Model 8508 audio generator and monitor reportedly allows its operator to listen to and acurately measure received analog signals appearing at the modem/-telephone line interface.

The unit generates a 1 kHz tone, variable from 0- to -16 dBm, which can be patched into a telephone line to determine line losses, IDS stated.

The IDS Model 8554 is a four-position selector switch and monitor module which reportedly allows the user to select any one of four 25-wire RS-232 interfaces.

The 8508 audio generator is priced at $810, or $730 for a rack-mounted version; the 8554 switch costs $255, IDS said from 100 Nashua St., Providence, R.I. 02904.

Develcon Modem Transmits 20 Miles

SASKATOON, Sask. — Develcon Electronics Ltd. has introduced the DS513; an asynchronous limited-distance data set.

The DS513 was designed for operation over metallic twisted-pair cable at speeds up to 9,600 bit/sec and distances up to 20 miles.

Transmission speeds up to and including 4,800 bit/sec can be achieved over loaded cable, according to the firm.

Typical operating distances on 26-guage cable is six miles at 9,600 bit/-sec, 10 miles at 4,800 bit/sec, 17 miles at 2,400 bit/sec and 20 miles at either 1,200- or 300 bit/sec, Develcon said.

Develcon's limited-distance data set costs $275 from the firm at 108 103rd St. East, Saskatoon, Sask. S7N 1Y7, Canada.

Multinationals Told About Overseas Nets

(Continued from Page 37)

because of the incorporation of standard protocols, Hale said. Packet switching will be first used in England, then France and Germany, he predicted, adding it would he a long time before it shows up in the developing nations.

Those contemplating the implementation of communications networks overseas are concentrating too much on the technical aspects of data communications rather than on the other aspects of multinational transmission, according to Janusz L. Madej, manager of international systems for Clark Equipment Co.

Implementation Aspects

The important implementation aspects of such multinational systems, Madej said, are the diffetent vendors, rates, equipment, languages and subsidiary companies.

But the legal aspects of implementation are possibly the most important, he noted. "Be very careful about the information which you are sending abroad, or it could be subject to government investigation," Madej warned. Data scrambling may be necessary to bypass the PTTs, he said.

In addition, multinational networks should be part of the corporate management function. The network's function is to help manage and control the company, to help provide competitive services and to realize economies of scale, Madej said.

The networks also tie the corporate system with each overseas system to achieve consolidation for order placement, acknowledgement of received information and updating of local data bases, he noted.

Users should ask themselves "What is the function of the network?" rather than "What is the data which will be transmitted?" before they decide to install a network overseas, the speakers agreed.

PTS-1200 Enhanced As Hasp Workstation

(Continued from Page 37)

tions with mainframe spooling programs over leased lines or manually switched, half-duplex dial-up networks at speeds up to 9,600 bit/sec, he added.

The PTS-1200 handles data compression and supports multileaving, which permits several files to be simultaneously transmitted and received. With the enhancement, the processor supports four input and seven output streams in addition to the system console stream, Raytheon said.

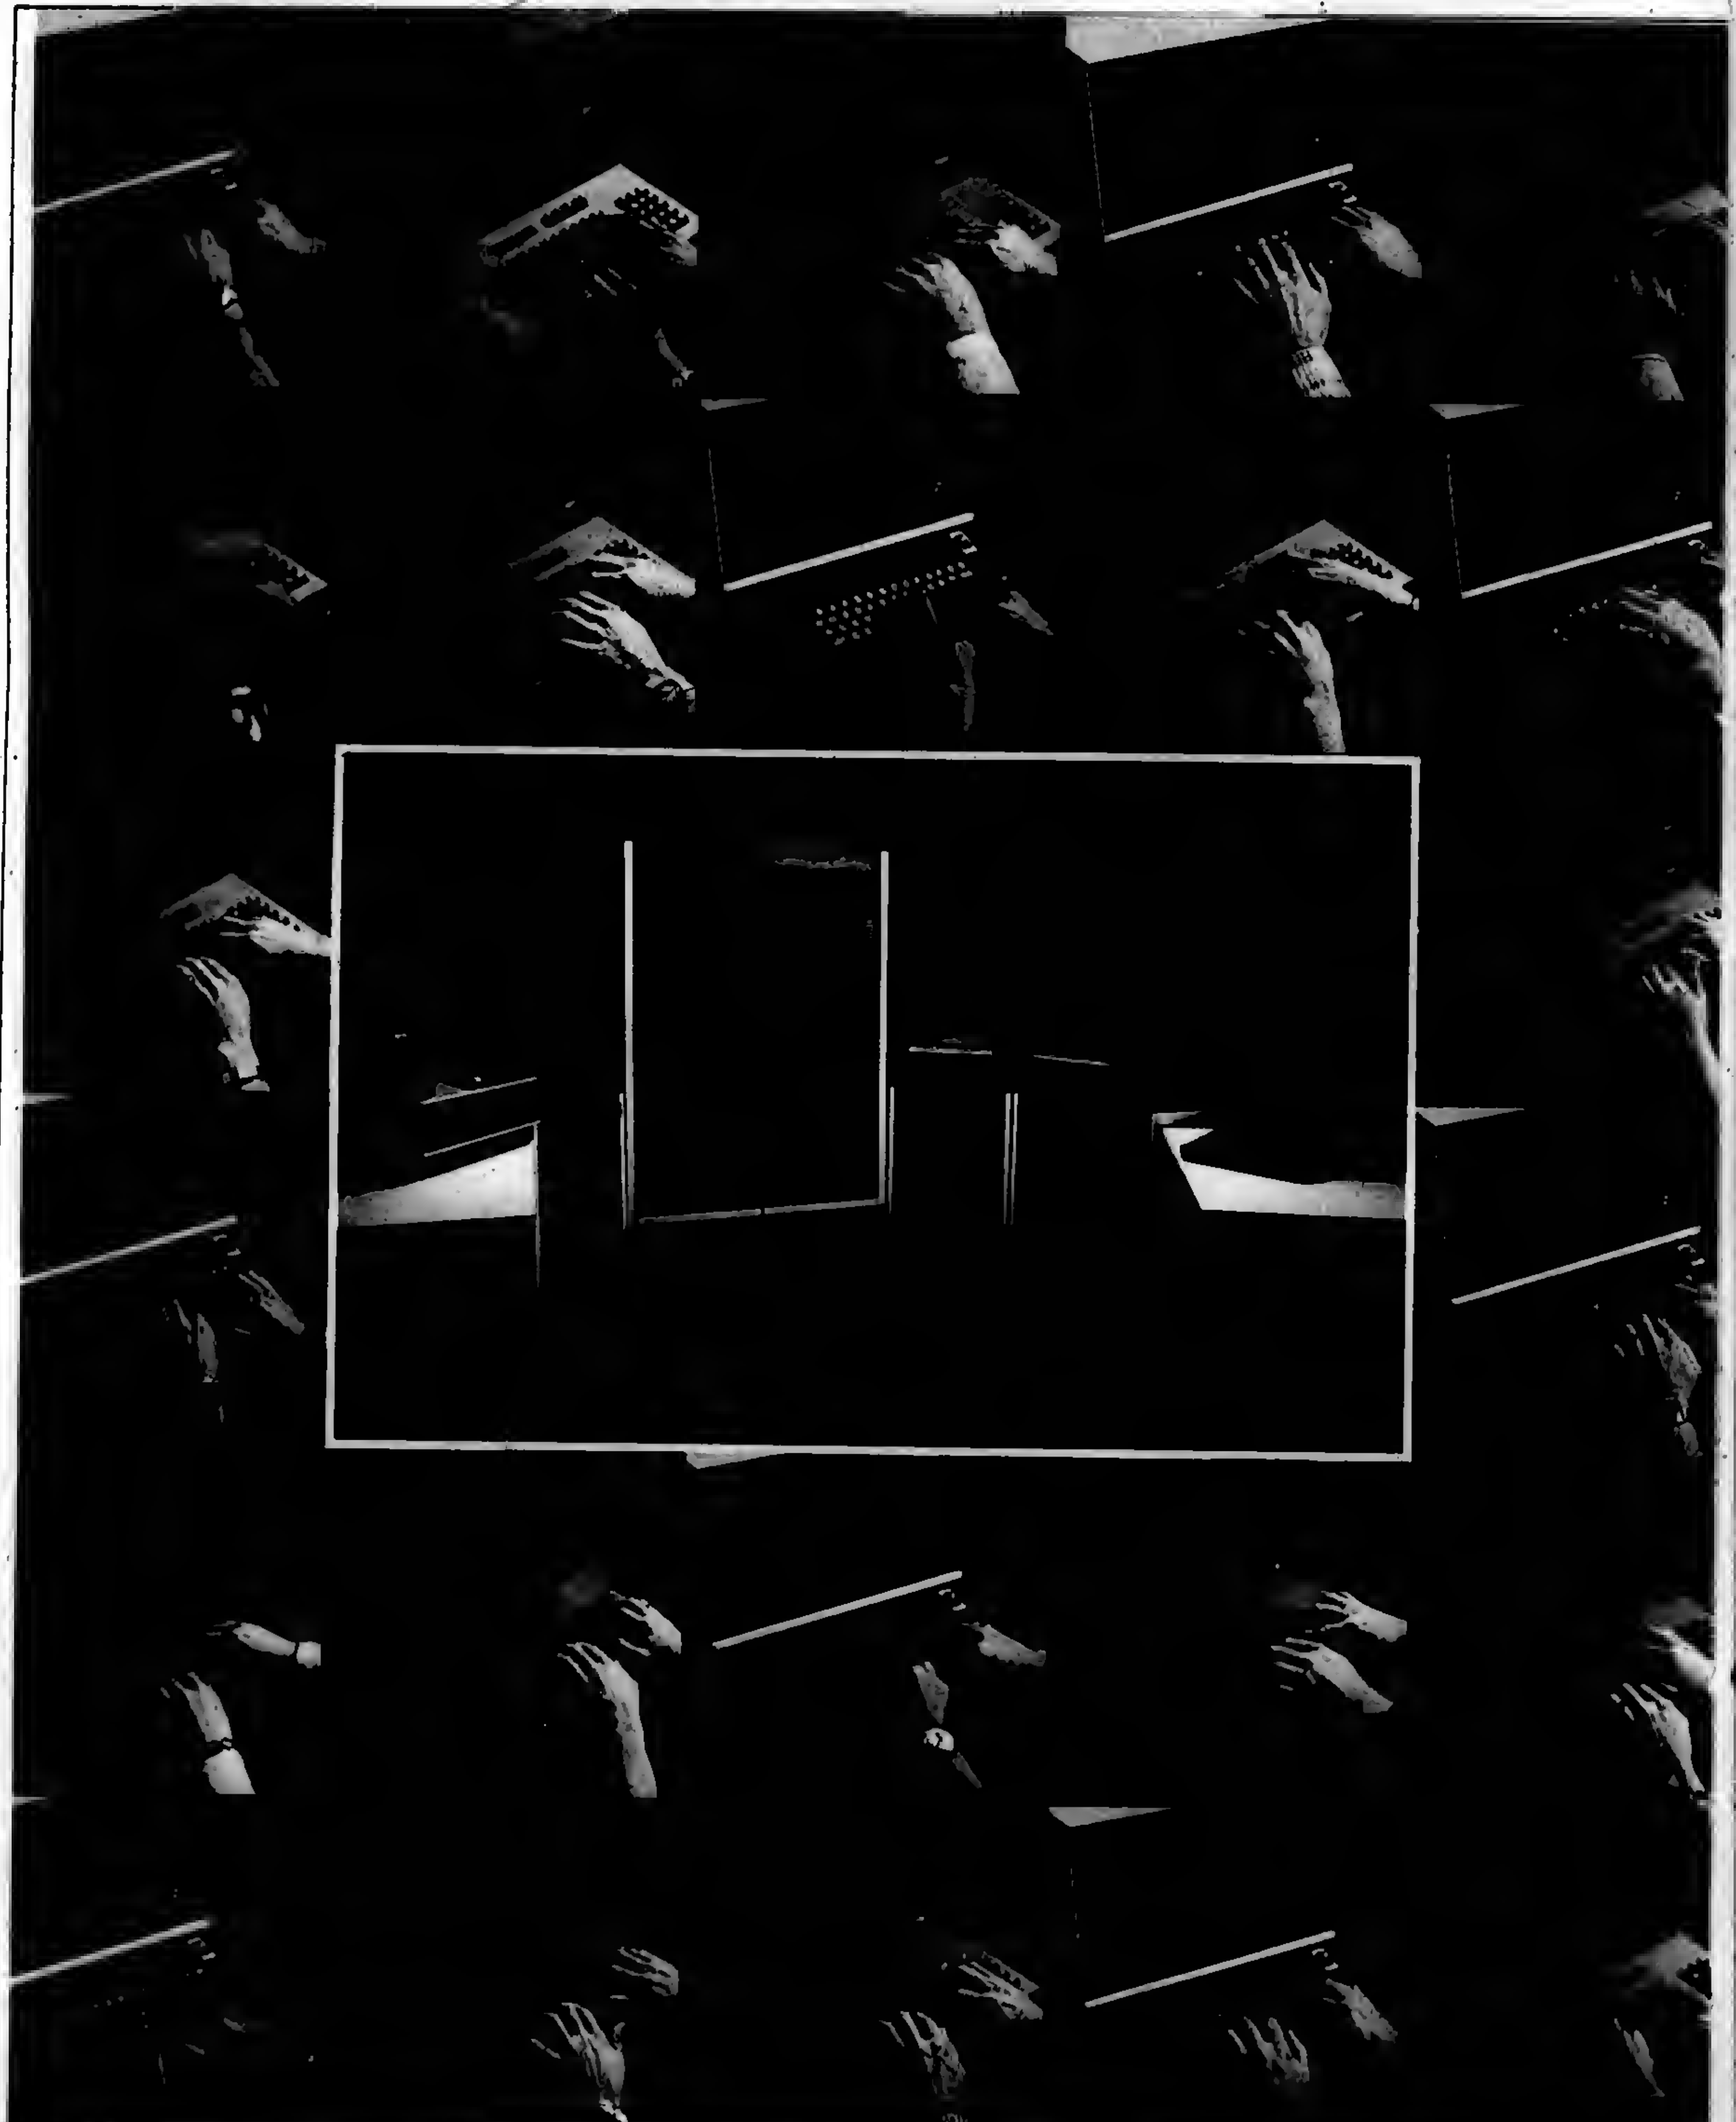
The software needed to support the 360/20 workstation enchancement is available without charge, the company added.

Badge Reader Bows

The Model 6140-01 security badge reader allows PTS-100 system users to restrict access to individual keyboard display terminals and/or applications programs and to restrict access from PTS-100 terminals to a host computer, the spokesman stated.

The device decodes up to 14 digits of numeric information contained on perforated cards the size of standard credit cards.

The security badge reader sells for $750 or rents for $26/mo. Raytheon is located at 1415 Boston-Providence Tnpk., Norwood, Mass. 02062.



MCI's Telemanagement Optimizes Phone Call Routing

CW Photo by R. Frank

Tom Richter, MCI's Dallas operations manager, enters data into Danray computerized switch using CRT.

By Ronald A. Frank

Of the CW Staff

DALLAS — A computerized switch is helping MCI Telecommunications, Inc. offer a service that optimizes phone call routing for business users to minimize their monthly phone bills.

Called Telemanagement, the MCI service provides users with optimum routing for calls and provides users with optimum routing for calls and provides complete monthly billing statistics for charge-back and other cost-accounting procedures.

The MCI service is available in six cities now, but plans call for expanding it to 37 cities by September, according to Gerry Taylor, vice-president in charge of the southwest region.

Telemanagement was designed to be used by any customer who has a phone bill of $5,000/mo or more, Taylor said. When a customer utilizes the service, his in-house switchboard is connected to the Telemanagement equipment at the MCI terminal location.

In Dallas, the company uses dual Danray, Inc. CTSS 1000 switches. Each contain dual Keronix, Inc. minicomputers which monitor call information and provide statistics on traffic to the user.

The Keronix CPU (only one is used with the other as backup) enters the traffic information onto a disk subsystem which contains 10M bytes of storage, according to Tom Richter, Dallas operations manager.

The Danray switch also includes a tape drive. Some customers are given monthly phone traffic information on tape (instead of a printout) which is then ready for processing on their in-house mainframes, Taylor said.

Handles Voice, Data Calls

Telemanagement can handle both voice and data calls depending on user-specified priorities. In some cases, if a customer wants his data transmitted without delay, such calls are given preference by the switch and are connected regardless of whether there are other calls waiting for line facilities, he said.

Customer switchboards are connected to the MCI terminal location by phone company local loops, and as part of the Telemanagement service all lines are checked for operational status each morning, Richter explained.

Also included in the Danray equipment is a Cognitronics Corp. audio response system. When a calling user is held in a queue because all facilities available to his line are in use, the processor will activate an audio message explaining the situation.

Customer priorities can be modified as necessary and a CRT or teletypewriter is available to MCI operations personnel to update instructions to the system.

The Telemanagement service currently handles calls for about 125 customers and there is a waiting list of those who want to be connected in the various cities, Taylor said.

Typical Charges

A typical call placed on the MCI service costs about 18 cents to 22 cents per minute depending on the typ~~e of line~~ facility used. By comparison, a dial-up call on the telephone net costs about 40 cents per minute, Taylor noted.

The lower cost can be attributed to optimizing the use of Wats, foreign exchange and other types of lines, he said.

Typical savings for users of the Telemanagement service can range from 30% to 40% of existing monthly phone bills depending on the number of lines and types of facilities used, Taylor said.

Many of the features available to users of the MCI service are also provided to larger customers of the phone company through its Common Control Switching Arrangement (CCSA) facilities. Telemanagement makes it possible to bring this type of service to smaller users that cannot justify the CCSA capabilities, Taylor said.

All at once, it's Harris.

Harris now delivers the most cost/performance effective multi-use computer system in the industry.

Our new family of high performance systems—S115, S125 and S135—together with our powerful VULCAN Virtual Memory Operating System supports more than 50 terminals. Simultaneously.

This is a whole new line of medium-scale, multi-use systems with increased reliability and new state-of-the-art technology. You get greater I/O throughput. MOS memory with error correction. Powerful micro processor based CPU. Broad selection of highly reliable peripherals. And all operate with ANSI 74 COBOL, FORTRAN, RPG II, FORGO, SNOBOL, and extended BASIC.

The Harris S100 systems take on many different jobs all at the same time. Multi-stream batch processing. Multiple concurrent RJE's, both host and remote. Multiple interactive time sharing. Real-time processing. And this new generation of high performance computer systems from Harris delivers these all to you, *concurrently.*

If your need is distributed processing, time sharing, data base management, or any type of concurrent multi-use application, *benchmark our new computer system against any other system in the industry.*

Harris Computer Systems, 1200 Gateway Drive, Fort Lauderdale, Florida 33309. Telephone (305) 974-1700. Europe: Harris Intertype, Ltd., 145 Farnham Road, Slough, SL1 4XD, England.

Micral CRT From R2E Has 24K-Byte CPU

ORSAY, France — R2E, a French minicomputer manufacturer, has introduced an intelligent CRT terminal system designed for DP applications, word processing and automatic typesetting.

The Micral C consists of a 24K-byte processor expandable to 32K or 64K of random-access memory (RAM), a 1,920-character CRT unit and an integrated keyboard station, a spokesman noted.

Two "minifloppy" disk drives offer the Micral C users 160K bytes of data storage for on-line applications. In addition, the terminal system has a parallel printer interface for Centronics Data Computer Corp. printers, he said.

An advanced Business Applications-Oriented Language (BAL) with file management is available with the terminal, as is Fortran and Assembly language.

The terminal costs $8,995. Additional RAM storage in 8K increments costs $395.

The company's U.S. agent, L.H.A. Associates, is located at 8589 Tanglewood Trail, Chagrin Falls, Ohio 44022.

Micro-Based Graphics Unit

Raster Scan CRT Designed for Novices

PALO ALTO, Calif. — Hewlett-Packard Co. has brought out the HP 2648A, a microprocessor-controlled graphics CRT terminal that utilizes raster scan technology and was designed for users with little or no programming experience.

Although the 2648A was developed for graphics applications, the terminal has the data entry and communications capabilities of the HP 2645A CRT, HP noted.

HP 2648A

The raster scan display/refresh technology reportedly gives the terminal an easily read display and enables users to erase and modify the display selectively without redrawing the displayed image.

This minimizes the user's waiting time and CPU overhead while reducing communications costs, according to HP.

In addition, both graphics and alphanumeric data can be viewed separately or simultaneously because they are stored in separate memories, HP said.

The basic terminal has 8K bytes of semiconductor memory, expandable to 12K, allotted to alphanumerics. Sixteen 16K random-access memories (RAM) provide a 360 by 720 dot resolution for the display of graphics, the company stated.

Terminal Transactions

The CRT displays data in a 24-line format at a density of 80 char./line and in 9 by 15-dot character cells, it added.

Features of the graphics terminal include the ability to zoom and pan the displayed graphics image with one keystroke without the support of a host CPU; a line-drawing capability between any selected point and the cursor; and area shading and pattern generation, according to the firm.

The terminal also can help guide its operator in plotting tabular data and offers automatic plotting independent of the host.

The terminal can be equipped with optional built-in cartridge tape drives to provide 220K bytes of local data storage for on- and off-line applications, HP noted.

The price for a basic HP 2648A is $5,500; when equipped with the cartridge tape drives, the graphics terminal costs $7,100. Deliveries are scheduled for August, an HP spokesman said from 1501 Page Mill Road, Palo Alto, Calif. 94304.

Decprinter Gets Serial Interface

MARLBORO, Mass. — Digital Equipment Corp. has introduced a single printed circuit module serial interface for the LA180 Decprinter I.

The interface is available in two versions, for use with either EIA or 20mA current-loop connection. It enables operation of the LA180 with serial output devices and through modem-equipped telephone lines.

EIA operation provides automatic answering capability for unattended operation with Bell 202-type modems or equivalents, DEC said. Both versions convert serial Ascii data to parallel input compatible with the standard LA180 and both are switch-selectable for data rates from 300- to 9,600 bit/sec.

The interface costs $525 from DEC at One Iron Way, Marlboro, Mass. 01752.

SDX Offers Add-Ons For Tektronix 4051

ORANGE COVE, Calif. — SDX, Inc. has introduced two types of add-on memory for the Tektronix, Inc. 4051 graphics display terminal.

SDX's S32K plug-compatible memory system expands the 4051 system memory from 8K to 32K words of main storage through the addition of a circuit board which fits inside the 4051 cabinet, according to the firm.

Tektronix graphics terminals with main memories of 16K or more can be upgraded in 8K increments with the SDX S8K memory expansion kit, SDX noted.

Each memory comes with diagnostic software for system and memory test functions.

The S32K costs $2,395 and the S8K kit costs $495; installation is provided free of charge, according to the company, which can be reached through P.O. Box 41, Orange Cove, Calif. 93646.

AJ Redesigns Model 860 To Meet APL Users' Needs

SAN JOSE, Calif. — Anderson Jacobson, Inc. (AJ) has come out with a version of its AJ 860 desktop teleprinter terminal designed to meet the special character set requirements of APL language users.

The AJ 860/A uses a 9-wire dot matrix print mechanism to produce each character in a 9 by 12 cell.

The AJ 860/A costs $3,285 and will be available in the fourth quarter from the firm at 521 Charcot Ave., San Jose, Calif. 95131.

Perkin-Elmer Has Upkeep Plan

RANDOLPH, N.J. — Perkin-Elmer Data Systems has introduced a maintenance plan for users of its equipment.

"No Hassle Service" provides toll-free telephone contact between the user and the company's Central Dispatch.

The service allows certain diagnostics to be run while the customer is on the phone, Perkin-Elmer is at Route 10 and Emery Ave., Randolph, N.J. 07801.

An Editing Pet That

The perfect editing terminal for transaction processing must be more than a little bit smart. It has to be wise like our OWL-1200. With features that assure high accuracy source data entry, fast data editing, simplified host computer programming, and reduced host computer loading.

Our OWL gives you all the human engineering features you get with our FOX-1100, plus a lot more. And the price is right. Just $1496 in quantities of 25.

Check the comparison chart of editing terminals to see all the reasons why the OWL-1200 is simply "incomparable."

USER REQUIREMENT	FEATURES	PERKIN-ELMER	HAZELTINE	LEAR SIEGLER		ADDS
		OWL-1200	MOD. I EDITING	ADM-1A	ADM-2	980
High Operator Data Entry Accuracy	Protected fields	Yes	Yes	Yes	Yes	Yes
	Low-intensity fields	Yes	Yes	Partial	Partial	Partial
	Numeric only fields	Yes	Yes	No	No	No
	Inverse video fields	Yes	Yes	No	No	No
	Blink fields	Yes	Yes	No	Yes	Yes
	Line drawing capability	Yes	No	No	No	Yes
Simple, Fast Editing of Data	Insert/delete character	Yes	Yes	Partial[1]	Yes	Yes
	Insert/delete line	Yes	Yes	Partial[1]	Yes	Yes
Minimized Loading on Host Computer	Host programmable send keys: send all data, send only unprotected data, send only data modified by operator, send only a "request to send" header.	Yes	No	No	No	No
Simplified Programming	Ability of host CPU to read device status	Yes	No	No	No	No
	Ability of host CPU to read device mode key settings and communication option straps	Yes	No	No	No	No
	Program override on mode key settings	Yes	No	No	Yes	No
Simplified Program Debugging	Transparent mode permits all characters to be displayed	Yes	No	No	No	No
Cost Effectiveness	OEM price in quantities of 25*	$1496	$1670	~~$1795~~ * $1595	~~$2395~~ * $2095	$1995

*When unit includes editing capabilities, 24 x 80 display, numeric pad, and upper/lower case characters.

[1] No Key. Requires Two Key Code.

* Just announced price changes

Firm Speeds Job-Costing Chore

Badge Reader Devices Put Timely End to Time Cards

PARAMOUNT, Calif. — The installation of an on-line job-costing system at a manufacturing firm here reportedly has allowed the company to collect and process twice the time-and-material and payroll data in one-eighth the time as the previous manual system.

Lockhart Industries' system is comprised of badge reader terminals from Panasonic Corp. that are tied to a remote Hewlett-Packard Co. HP 3000-II Model 5 minicomputer in Long Beach, Calif.

Lockhart, which employs about 70 people, builds compact heat exchangers for use in airborne and shipboard navigation and guidance computer systems as well as oil coolers for motorcycles and automobiles.

The system collects the time-and-material data for invoicing, accounts payable and receivable and payroll. It was designed by Professional Computer Services, which houses the HP minicomputer.

Data is transmitted to the computer system over leased lines at 300- and 1,200 bit/-sec through Vadic Corp. modems.

Terminal Transactions

When reporting for work, employees sign in hy inserting a plastic badge with their employee number prepunched. This information is sent to the computer over the 300 bit/sec leased lines through Vadic 306G and 307G modems.

When ending a specific job, the production worker again inserts his badge into the Panasonic reader. He also keys in the job number, the subjob if any and the operation he has performed.

The computer verifies that he's a valid employee and that the job and the operation are valid. It measures the time interval and records the amount of time against the job.

Reports show the accumulation of time by workers on each job; this data is also used for the preparation of the payroll.

The system eliminates the need for time cards and manual posting of job-costing and payroll data.

Jobs are set up on the computer, costs other than labor and backlog are entered and output reports are printed using a General Electric Co. Terminet 1200.

The Terminet is located in the Lockhart plant and communicates with the computer system over a 1,200 bit/sec telephone line with Vadic VA1230K modems at each end. Two CRT terminals are similarly linked with the HP 3000.

Now an Hour's Work

According to Bill Pierce, Lockhart vice-president and treasurer, it now takes one person about one hour to do the reports. Before the system was installed — when Lockhart was doing half its present volume — the same reports done manually took one person a full day.

"The system costs about $1,000 a month. Without it, we would need two full-time people to do the same job," Pierce said.

"Also, we're getting much more management information. And the system is so simple that we can train someone to operate it in a couple of hours, which provides a continuity not possible with a manual system," he added.

Bob Goodman, owner of Professional Computer Services, said HP recommended the Vadic modems. "The modems have been very reliable and we're impressed with the diagnostics. For example, using local loopback, we can check out the modems at our computer site.

"Then, by switching to remote loopback, we can test the phone lines and the modems located at the Lockhart plant," Goodman said.

Daily and Weekly Reports

A daily report is printed showing all labor entries by employee for a permanent time record. Exceptions are flagged and the report is reviewed for errors. Corrections and additions are entered each day.

A daily absentee report is printed, as are weekly labor reports by job and by employee to provide an audit trail of all labor entries into the job cost.

A weekly gross wages report by employee is furnished for payroll purposes.

Labor costs are accumulated by operation. Raw material, purchased parts and outside processing are accumulated by purchase order. A complete record of all job costs is maintained.

A summary of costs by job is available showing the direct labor, raw material, purchased parts, outside processing, last entry date and total costs.

Labor costs can be extracted hy operation and subjob. Labor costs per unit are also available. External costs can be listed by purchase order and vendor, with raw material, purchased parts and outside processing segregated.

A backlog file is maintained hy purchase order line item within each job. Invoices are prepared interactively using the backlog file as a source of data. Payments can be coded to apply to the oldest invoices to preclude the necessity for listing individual invoices or to specific invoices.

A data hase management system is also used to allow immediate and easy access to files for inquiry into job cost, employee data and accounting data.

Program changes are simplified by the independence of the programs from the data structure.

Techtran Adds Portable 815

ROCHESTER, N.Y. — The Model 815 Datacassette from Techtran Industries, Inc. is now available in a rechargeable battery-powered version, for data storage and retrieval applications.

The 815 weighs 10 pounds and the batteries are self-contained supplying a minimum of eight hours of continuous operation between charges, according to the firm.

The battery-powered 815 is priced at $1,095 including batteries and charger, Techtran said from 200 Commerce Drive, Rochester, N.Y. 14623.

Commercial ECLIPSE Systems.
Because a computer should be a vehicle for growth.

For most companies, buying a computer is a big step forward. So you want to be sure the computer you invest in will keep rolling with your company. That's why you want a Data General commercial ECLIPSE data processing system.

Our systems can be expanded in several directions at any time. For instance, as your transaction volume grows, you could move from two to eight, sixteen or more terminals. And as your files and records expand, you could add disc capacity from 10 megabytes and grow to over 1500 megabytes. And with our powerful communications capabilities, system configurations can range all the way up to a multiprocessor network with distributed processors as more applications are added.

Plus our commercial ECLIPSE data processing systems also work easily with larger commercial computers. They use the same high level ANSI '74 COBOL larger systems use, the same language your staff is already used to. So, even if you start with our smallest configuration, you're really beginning farther up the ladder than with any other small computer system.

Data General commercial ECLIPSE systems. They can take the pain out of growing. Now put your future on the line and send for our booklet.

☐ Send me your commercial ECLIPSE brochure, "Smart answers to your data system demands."
☐ Send your brochure and have your sales representative call.

It's smart business.

Also Makes Price Changes

Burroughs Adds Four Units to Medium, Large Systems

DETROIT — Burroughs Corp. has expanded both its medium and medium-to-large-scale systems with the addition of four models. The firm also announced pricing changes on several other models.

In expanding its B6800 series, Burroughs added two entry-level systems, the B6803 and the B6805, which provide 50% and 60% respectively of the throughput of the firm's B6811, according to a spokesman.

The basic B6803 includes a 5 mHz CPU, a 12-channel I/O processor, 786,000 bytes of 770 nsec error-correcting core memory expandable to 3 million bytes, a maintenance diagnostic processor and an operator console with dual displays. It sells for $299,000 or leases for $8,600/mo on a 12-month lease.

The basic B6805 offers features similar to the B6803 with the exception of memory, which is 325 nsec error-correcting planar memory. The B6805 sells for $360,000 and leases for $10,355/mo on a one-year lease.

Deliveries for both models are scheduled to begin in the third quarter.

The firm also added two top-of-the-line models to its B2800 series, the B2810 and B2815.

The B2810 and B2815 models are object code-compatible with the larger B3800 and B4800 systems as well as with earlier B2700, B3500, B3700 and B4700 systems, the spokesman claimed.

The two models feature an I/O subsystem that offers up to 24 channels, each having its own Data Link processor. The Data Link processor accepts I/O commands and executes them independently of the CPU, he said.

A basic B2810 features a 2mHz CPU, 125,000 bytes of 667 nsec error-correcting MOS memory that can be expanded to 500,000 bytes, an 8-channel I/O subsystem and either a printing or display console. The basic B2810 with 250,000 bytes of memory costs $152,860 or $3,505/mo on a five-year unlimited lease plan.

A basic B2815 is similar to the B2810; however, the CPU operates at 3mHz. A basic B2815 with 250,000 bytes of memory can be purchased for $197,660 or $4,515/mo on the five-year plan. Deliveries are scheduled for the fourth quarter, the spokesman said, adding lease rates for all B2800 and B6800 systems now include around-the-clock field service seven days a week.

Burroughs has also increased the performance of its B6807 up to 60% by incorporating improved memory access logic which enables the CPU to utilize main memory more effectively, he said.

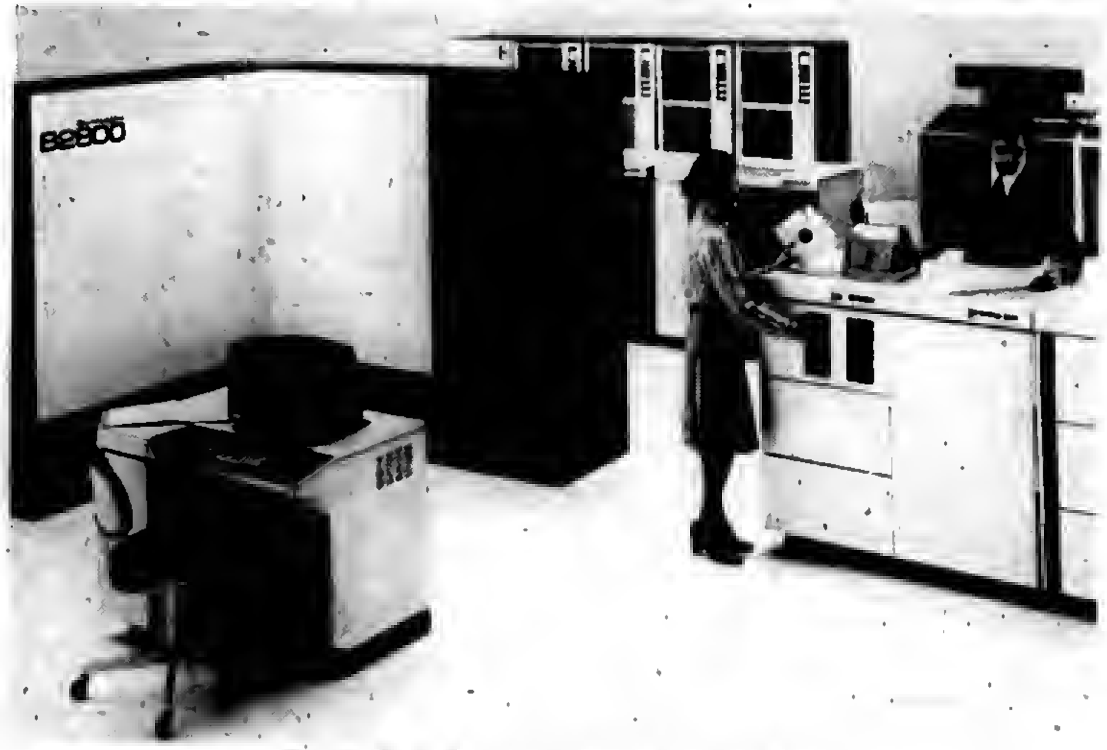
In addition, the B6806 and other B6800 series systems underwent pricing changes.

A basic B6807 with a 6.67 mHz central processor, a 20-channel I/O processor, maintenance diagnostic processor, dual-display operator console and 1.2 million bytes of planar memory can now be purchased for $589,000 or leased for $17,080/mo on a one-year lease, the spokesman said. This represents a 23% increase in purchase price and a 4% increase in lease price.

The B6811 with 1.2 million bytes of planar memory can now be purchased for $697,000 or $20,160/mo on a one-year lease. This represents a 5% reduction in purchase price and a 4% reduction in lease price.

The dual-processor B6821 with 2.2 million bytes of planar memory has been reduced 3% to $1,538,000, and the lease price has been trimmed 1% to $42,800/mo on a one-year lease. All lease prices include the 24-hour/7-day service availability.

In addition, price adjustments for the B2802 and B2803 systems were made. The basic systems with 250,000 bytes of memory now cost $151,315 and $198,095 respectively. Five-year lease rates are $3,515/mo and $4,445/mo.



Burroughs B2815 in a Financial Configuration

Zip Code Comparisons

Firm Uses 360 to Help Consumers Find Dealers

By Nancy French
Of the CW STaff

PEORIA, Ill. — A marketing services firm here is using an older medium-size mainframe and nine toll-free "800" telephone numbers to help consumers contact manufacturers or dealers who service their products.

At the heart of the Ruppman Marketing Services' 24-hours-a-day, seven-days-a-week marketing service is a leased IBM 360/40 and disk-resident data base.

An operator seated at a Courier Terminal Systems, Inc. CRT terminal here in Peoria can help a TV owner in Alaska find the most convenient place to service his TV with only a Zip Code to go on, according to Dave Ritterbusch, programmer/analyst at the firm.

The 360/40 is programmed to translate latitude and longitude into physical distances between Zip Codes. By comparing the home Zip Code of a prospect with the Zip-Coded list of dealers provided by its clients, the firm's mainframe can locate the names and addresses of the three closest dealers of the product about which the consumer is inquiring and can display it on the operator's CRT.

Conversely, the computer can also help each dealer locate its prospects and determine how to reach them through telephone advertising, direct mail and other marketing methods which, not coincidentally, can also be obtained from Ruppman.

Panasonic and British Leyland Motors are already on Ruppman's customer list, according to Ritterbusch.

Follow-Up Information

Some clients, such as the Air Force, want information captured about callers for follow-up. In that case, the operator asks the caller's name and address and keys them in along with answers to any other questions the client may want.

Ruppman can then send CPU-generated daily or weekly reports of callers' names and addresses to the client or even follow up with direct mail pieces, Ritterbusch said.

Ruppman's processor also keeps two IBM 1401 printers busy three shifts a day spewing out customized letters, some of them to customers of one loan company.

The letters, which are part of Ruppman's continuous customer contact service, "keep the customer feeling the loan company is interested in him as an individual," Ritterbusch explained, adding, "Most people who deal with a finance company feel they've been had."

These letters, which are sent out at predetermined times, try to capture what the individual is thinking about at that time and include such giveaways as budget planners.

The letters are tailored to each customer, based on the parameters of his relationship with the loan company, Ritterbusch added.

Ruppman also uses this system for a magazine collection program for several publishers' fulfillment houses, including those serving *Saturday Review* and *Ladies Home Journal*, Ritterbusch said.

When Panasonic TVs were recalled several years ago because of a manufacturing defect, Rudderman, with its data base of Panasonic TV warranty holders, played an important role. Panasonic publicized the recall program with an advertising campaign that utilized direct mail as well as use of the 800 number so TV owners could more easily find their nearest dealer for repairs, Ritterbusch said.

Interestingly enough, the firm does no housekeeping chores on the 360/40. When its accounting department was automated, a Burroughs B700 small business system with standard vendor-provided accounting packages was obtained, Ritterbusch said.

When the Model 40's lease is up next year, the firm will probably install a second 40 in a dual-processor configuration with the present system, with shared tape and disk subsystem, he said, rather than upgrading to a 370.

EMM Offers Memory Upgrade For IBM 360/65 and 370/148

HAWTHORNE, Calif. — Electronic Memories and Magnetics Corp. (EMM) has introduced add-on memory for users of IBM 370/148 and older 360/65 processors.

In its enhancement of 360/65 systems, EMM said it can now install up to 8M bytes of add-on memory per CPU. The memory offering also includes the models 65MP and 67, a spokesman added.

A deferred maintenance feature is available for all main storage which allows users to switch failing memory off-line in 1M-byte increments, he said, adding the CPU upgrade is included in the package.

The upgrade memory sells for approximately $100,000 per megabyte, the spokesman said.

IBM 370/148 users can now expand their CPUs to 4M bytes, effectively doubling the present maximum capacity allowed, according to the spokesman. The 148 memory is a functionally equivalent, pin-compatible semiconductor memory utilizing 4K static random-access memory devices, he added.

Also featured is the System Interface Module that provides the signal timing and data control functions. It also controls the Basic Storage Module that contains 18 memory boards, providing a maximum capacity of 1M byte. Each board contains 128 4K-bit elements.

Up to three Basic Storage Modules providing up to 3M bytes of storage and one System Interface Module are contained in one cabinet, according to the spokesman.

The system is priced at $75,000 per megabyte. Initial deliveries will begin late in the third quarter, the spokesman said from 3216 W. El Segundo Blvd., Hawthorne, Calif. 90250.

Management Courses Listed in AMA Guide

NEW YORK — The American Management Associations' (AMA) is offering its "Management Development Guide" catalog of courses at no cost to *Computerworld* readers.

The 264-page guide lists the AMA's educational services to management.

The catalog is divided into two parts. The first covers the center for Management Development, seminars, courses, briefings, customized in-company training and career development.

The second part discusses publications, the Center for Planning and Implementation, Presidents Association, multimedia in-company training and other programs.

The catalog can be obtained from the AMA at the American Management Associations Building, 135 W. 50th St., New York, N.Y. 10020.

Datawest Introduces Array Processor, Univac Interface

SCOTTSDALE, Ariz. — Datawest Corp. has introduced both a channel interface for the Univac 1100 series processor and the Datawest Real-Time III microprogrammable array transform processor.

The interface uses the word channel as the I/O device and reportedly offers the Univac 1100 user relatively high-speed array processing, according to a spokesman.

The array processor is microprogrammable and contains its own data memory, which is expandable up to 1M byte. Word size is compatible with the 1100 series product line, he explained.

The interface costs $15,000 from the firm at 7333 E. Helm Drive, Scottsdale, Ariz. 85260.

RTE Called One of Best System Evaluation Methods

By John P. Hebert
Of the CW Staff

DALLAS — End users of computer systems are being given more importance in the systems procurement process, but one of the best evaluation methods has not yet filtered down from government to private DP operations.

That method, remote terminal emulation (RTE), is a computer measurement and evaluation technique in which the teleprocessing workload imposed on a computer system is emulated by another computer, Marshall Abrams of the National Bureau of Standards (NBS) said at a recent conference here.

At NBS, computer systems are judged by their service potential to the end user — the person sitting at the system terminal — rather than by their potential utilization, according to Shirley Ward Watkins, a computer scientist at NBS' Institute for Computer Sciences and Technology.

RTE helps the government base its procurement decisions around terminal response time and system turnaround time, Watkins explained.

Alternatives to RTE include a program internal to the host CPU or a driver implemented external to the system.

The techniques of using a tape mechanism to mimic a human operator or actually including the operator in tests do not give an accurate picture of the system being tested, on the one hand, or they allow too much data or too much subjective data to creep into the results, she indicated.

Best of Both Worlds

An RTE device emulates the terminal and the operator, allowing the best of both worlds, Watkins said.

RTEs have been around since the mid-1960s, implemented as both teleprocessing workload drivers and monitors, but now there is greater acceptance and recognition of their utility as a performance measurement tool, Watkins and the other panelists at the conference session agreed.

Working with the Mitre Corp., the U.S. Air Force has developed its own RTE, which has successfully tested a number of vendors' machines, including the Burroughs B6700; Digital Equipment Corp.'s PDP-11/70; Control Data Corp.'s Cyber series; and Hewlett-Packard Co., Honeywell Information Systems, IBM and Univac CPUs, according to Watkins.

And there are emulators which have been or are being devised by a number of vendors for their own systems.

But not all vendors' emulators with which NBS worked had the same definition of response time. A standard definition must be formulated before RTE testing begins in order to answer the questions of which system is most acceptable and whether future upgrades will be required, Watkins added.

Benchmark Objectives

Teleprocessing benchmark objectives for an RTE of the system under test are that it be representative of the service workload, be equitable to all potential vendors, that it test all system components and have a real-world resemblance, according to Jerry McFaul of the U.S. Geological Survey (USGS).

At USGS, the only existing method found able to achieve the USGS' goals was RTE, and vendors had to have their own emulators to be considered in the procurement process, McFaul told attendees.

He described USGS' heavy workload as being carried by from 48 to 96 asynchronous terminals transmitting through 300 bit/sec lines. Another 12 to 28 synchronous remote job entry (RJE) terminals are in operation at any one time at transmission speeds from 1,200 to 9,600 bit/sec.

In addition, the USGS has batch terminals running four to seven jobs with functionally distinct programs, McFaul said.

All vendors' RTEs could display both the actual CPU-to-terminal dialogue and the emulation status, while capturing the RTE traffic on log tapes, he said.

Some vendors' RTEs could display the exact position within the selected RTE "manuscripts" and all of them could also display the emulation status for the synchronous terminals in the system under test.

But minor modifications had to be made to all of the RTEs, McFaul said, explaining that the typical problem was a compounding of software and hardware errors.

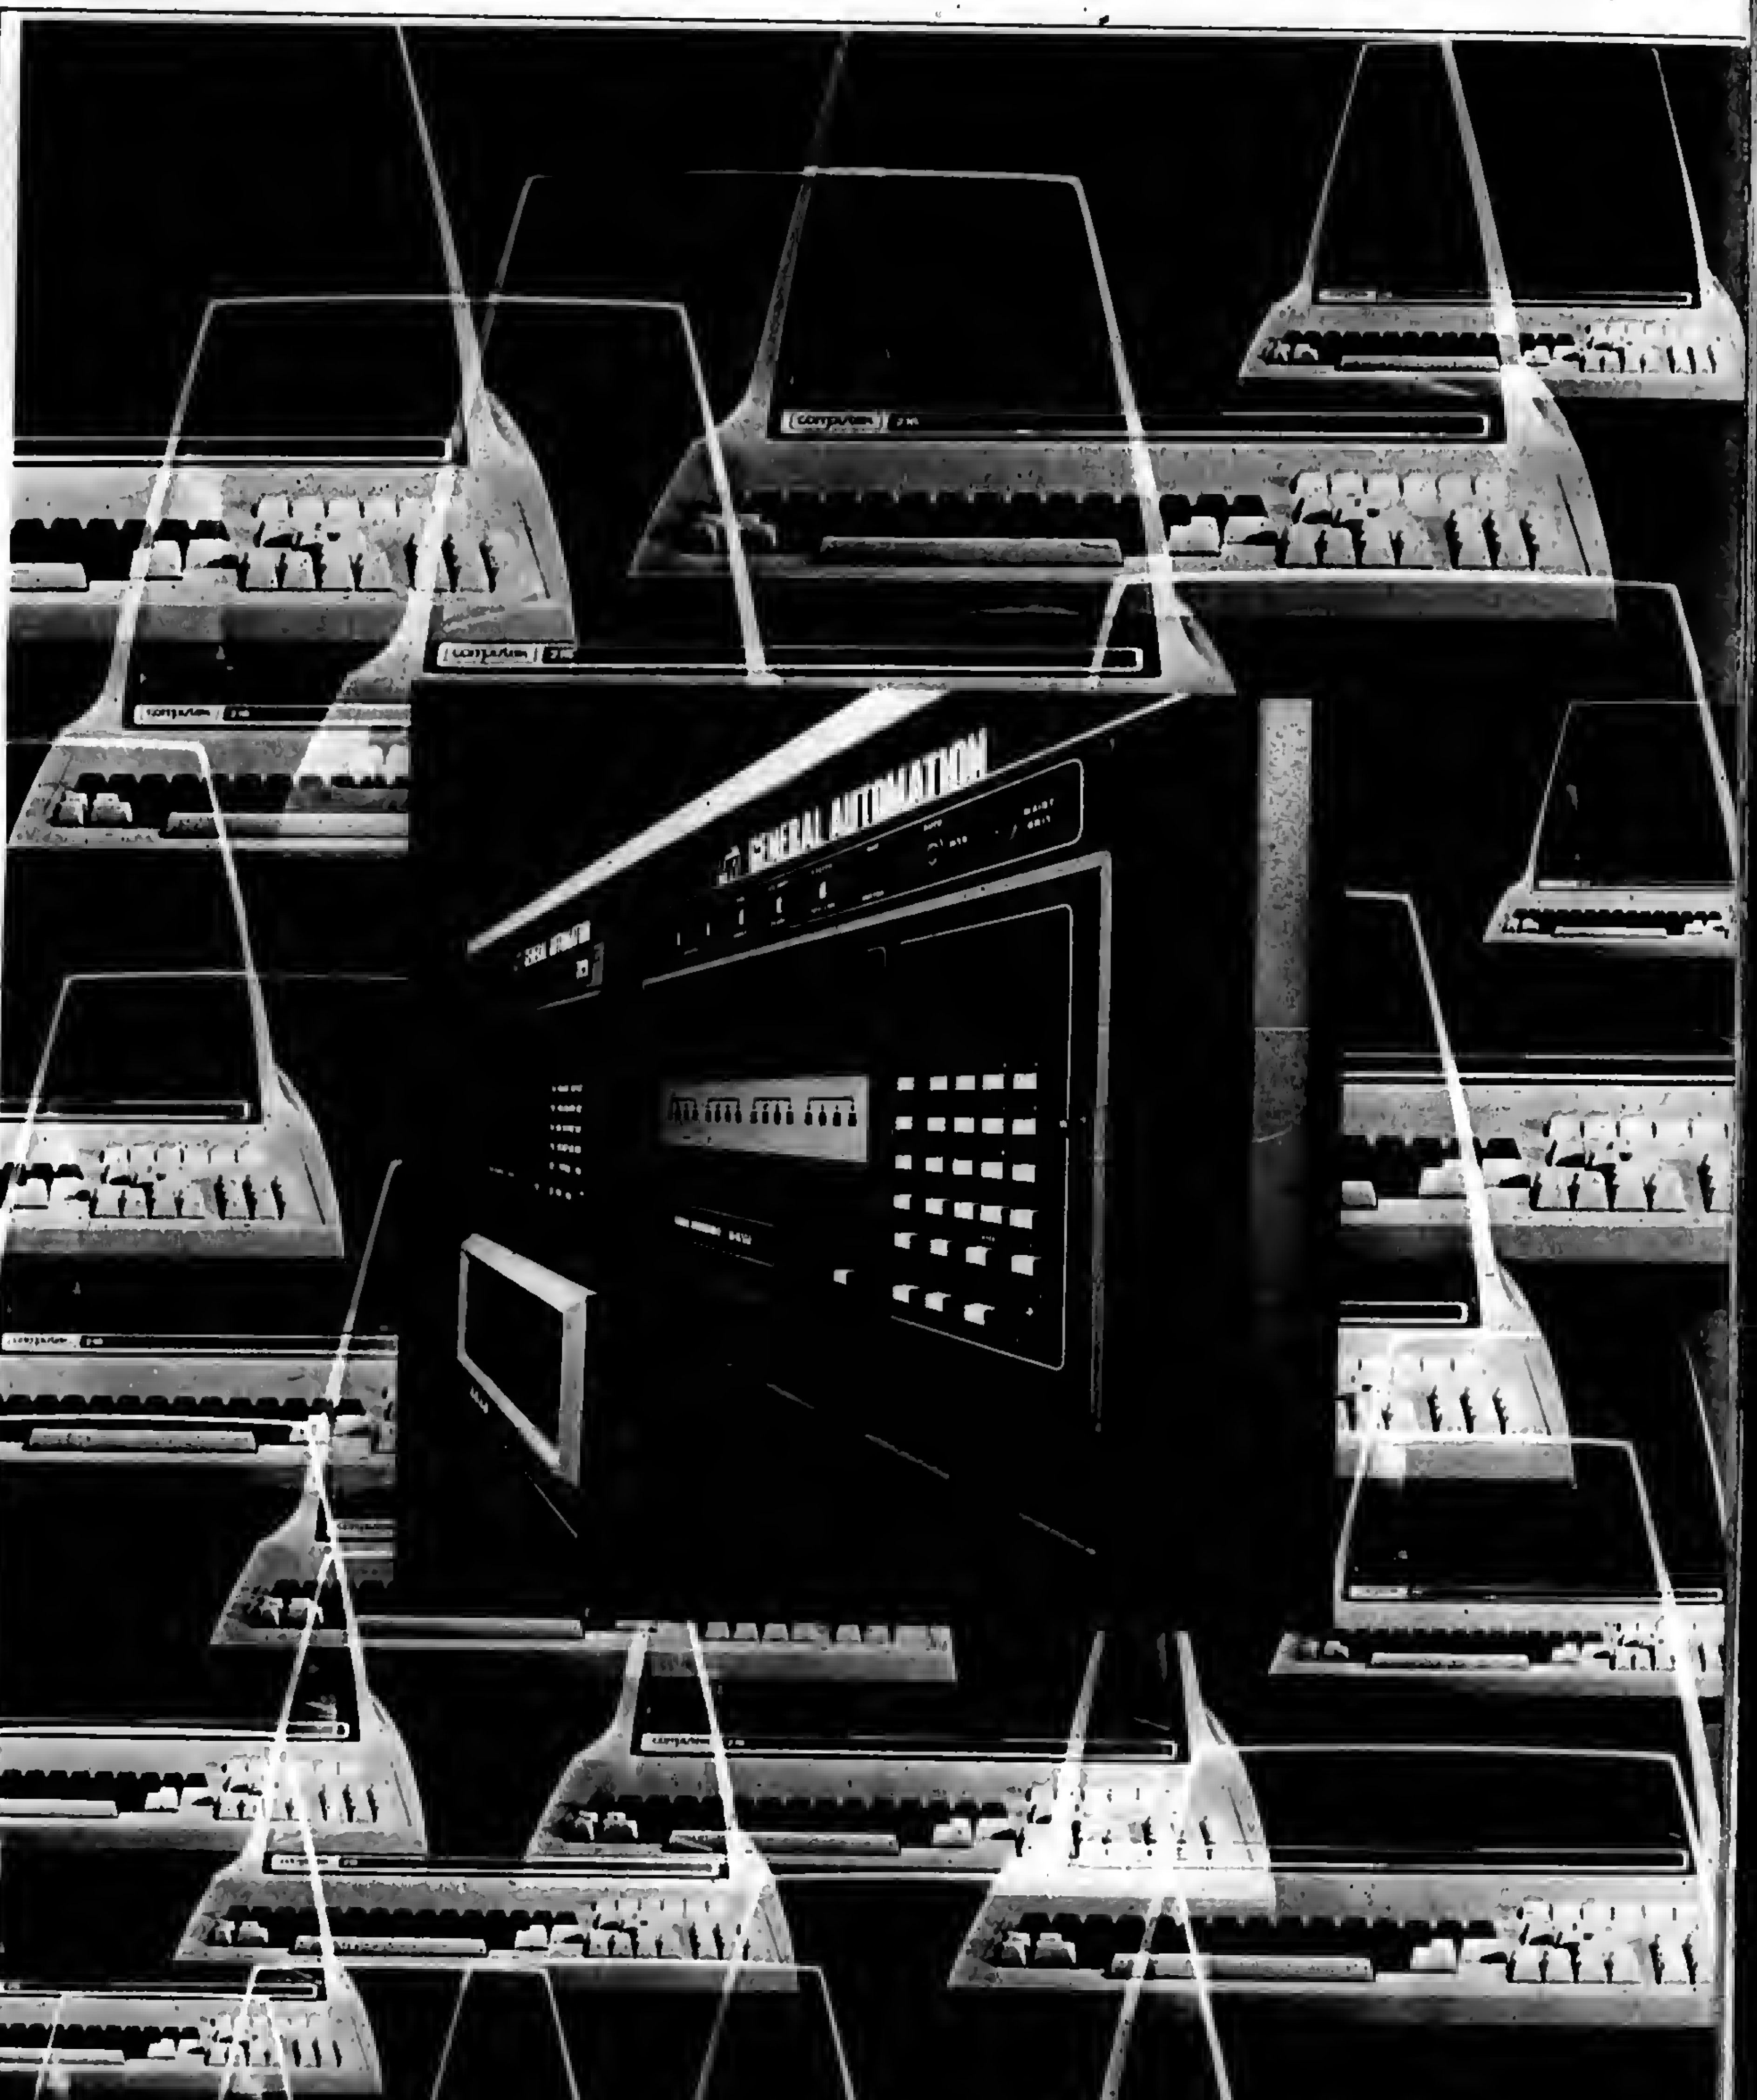
"Worthwhile Exercise"

"RTE is a worthwhile exercise. I'm confident the [Honeywell Multics] system we bought can handle a large terminal workload," he told session attendees.

And Couley Arthur, a Honeywell RTE engineer who worked with USGS was also on hand to describe RTE development and application criteria.

Honeywell's RTEs were developed by company engineers as a measurement tool and for simulation of intelligence using the terminal's protocol, Arthur said.

According to NBS' Abrams, vendors don't want the government to make a standard RTE benchmarker. It may be a long time before RTEs proceed from the ranks of government agencies to business users, he indicated.



Must Anticipate Bottlenecks

New Storage Techniques Seen Becoming Indispensable

By Frank Vaughan
Of the CW Staff

DALLAS — The performance aspect of systems is becoming so important that it may give rise to a situation where it becomes indispensable to adopt new technologies in the secondary storage environment, according to Peter Schneider of Siemens AG, speaker at a recent conference here.

Schneider discussed the demand he said he feels exists for new secondary storage technology.

"At the present state of technology, memory system costs remain the dominant factor in the overall cost of a computer system, with the costs of the secondary storage, in addition to those of main memory, representing an appreciable share of the total storage system costs," he said.

"Thus, if a new technology, such as charge-coupled device (CCD) or the bubble, is to be implemented in the storage system, it must ensure a more favorable price/-performance ratio of the overall system. It must; for example, either reduce the costs for an unchanged system performance level or substantially enhance the system performance level for a constant or rising cost burden," he explained.

Simulations have revealed that the degree of multiprogramming and the number of devices are factors of similar weight with regard to the CPU utilization level, but the number of devices represents the more crucial bottleneck, he reported.

"If the secondary storage system is underrated in terms of the number of devices employed in the storage system rather than in terms of the storage capacity, not even a high degree of multiprogramming will be able to raise the CPU utilization to a satisfactory level," he said.

"In view of the ever-increasing recording density in disks and the enhanced CPU performance levels, the emergence of a bottleneck in the secondary storage environment must be anticipated. It would appear that the adoption of a secondary storage hierarchy, managed by a storage processor, represents a more cost-effective approach than the provision of the devices required for parallel operation," he noted.

Simulation Models

Schneider supported his contentions with a series of charts, graphs and mathematical formulas that examined the simulation models used, distribution of processing time function, degree of multiprogramming, CPU utilization and page transfer times.

"For a constant on-line data file volume, an increase in the number of devices — for example, a distribution of the files among such a number of devices as are necessary to attain required I/O handling time — would considerably boost the costs and yet fail to lead to a full utilization of the devices," he charged.

Even in systems with a large on-line data file volume, the cost situation will give such a storage hierarchy complemented by cassette storage a competitive edge on a system with a large number of disks.

The performance data of the CCD technology will in any case accommodate the page transfer times which may possibly be required in the system, he said.

Quantor Ups Prices

MOUNTAIN VIEW, Calif. — Quantor Corp. has instituted an across-the-board price increase for all its computer output microfilm (COM) systems effective Aug. 1, according to a spokesman for the firm.

Prices will be increased, an average of 5%, he said, noting this is the firm's first price hike in over two years.

The increase was brought about by continually expanding systems and supplies support, including field service, across the country.

Unit Shreds Printouts

GLENVIEW, Ill. — Cummins-Allison Corp. has a desktop paper shredder for computer printouts.

The Cummins 45 has a 17-in. wide throat to permit flat feeding of printouts. The unit has a 12- to 14-sheet feed capacity and will shred at a rate of 90 ft/min, a spokesman said.

The 88-lb shredder costs $1,399 from the firm at 800 Waukegan Road, Glenview, Ill. 60025.

Count on GA's Network Series™ for documented savings.

General Automation distributed network modules: handling systems of 500 to 10,000 terminals, data bases to 50-billion bytes. Preferred by the world's largest banking, automotive, chemical and industrial companies, as solutions keyed to the corporate bottom line.

1. **Save: 6 to 1 on price/performance.** Users report: "The minicomputer hardware cost per transaction, per second, is about $50,000 (for GA Network Series modules)...compared to about $300,000...for our former mainframe solution."
2. **Save: 4 to 1 on hardware costs.** "...the present (GA) system was less than 25% of the expected cost of a mainframe system that could achieve the same performance levels."
3. **Save: 2 to 1 on programming costs.** "...Programming costs...to produce 118,000 lines of debugged code since 1975 were about 50% less (with GA Network Series modules) than those usually encountered in mainframe systems..."
4. **Save: 1.3 to 1 on communications costs:** "...recurring line costs for the communication network will be about 20% less with the (GA) distributive minicomputer system than an equivalent mainframe system."

Plus users report GA start-up time 15 to 1 better; project completion time 3 to 1 better; system reliability improved 10 to 1 (99.8% uptime in the world's largest bank).*

GA network development capabilities cover the full-range of distributive processing requirements, with the most configuration options packaged in our Network Series modules. A typical 8-processor module (2x6) supports 2000 terminals and 2-billion bytes. For 40% less than centralized mainframes.

GA's user-endorsed Network Series modules combine high-technology mini and microcomputer systems, with distributive processing expertise recognized internationally by many of the world's largest corporations.

Count on GA to match mainframe performance for minicomputer prices. Let GA put documented payoff on your bottom line.

DATA COMMUNICATION
EQUIPMENT BROKERS, INC.
4915 Fernlee
Royal Oak, Mich. 48073
(313) 549-3400

Wherever you Software Wizards happen to be, you can talk to Data General right now.

Call 617-366-8911. Collect.

Call this week. Tuesday, July 12, Wednesday, July 13, or Thursday, July 14 from 4 pm to 9 pm EST. And when you call, you'll be talking to our key managers. Who can tell you about Data General from your point of view. Because they're software professionals like yourself. They'll tell you how Data General has managed to become the fastest growing minicomputer company in the world. Growing at the rate of 50% per year. Growing so fast that we now have multiple openings for software professionals. Openings in everything from Operating Systems to Technical Documentation; Senior Systems Analysts to Programmers; Software Support Managers to Software Systems Engineers; and Engineering Programmers to Product Support Specialists.

You'll also hear about the opportunities, responsibilities, advancements, projects, people, challenges, promotions, insurance and possibilities. All this from the company that's the growth story of the industry. The company that's gone from sales of $1 million to over $177 million in just nine years. And the company that's sold and installed over 39,000 computers in 33 countries around the world. That means you've got to move as fast as we're moving.

Software Research and Development

Bill Foster, Director
Software Development

Data General's business is growing extremely fast, and Software Development is growing even faster. Our greatest challenge today is to find enough quality people to meet our expanding needs at both our Westboro, Mass. Corporate Headquarters and our R&D facility in the Research Triangle Park near Raleigh, North Carolina. In both locations we have immediate openings for all levels of Software professionals: junior and senior individual contributors as well as experienced project and section managers with proven track records.

If you have a background in one of the following areas, and you are looking for the opportunity to increase your technical or management responsibility, please contact us.

Operating Systems
Programming Languages
Data Base Management
Data Communications
Networks
Interactive Applications
Performance Measurement
Quality Assurance
Technical Documentation

Small Business Systems Development

Larry Seligman, Director
System Products

System Products designs and develops integrated hardware/software systems for specific market segments. Our technical personnel focus on designs (such as IDEA) which are easily used by the customer, make appropriate hardware/software trade-offs for efficiency and cost, and apply the latest technologies to maximize a product's useful life. We'd like to have those people apply who have compiler and microprocessor experience.

Engineering Programmers
Senior Project Programmers
Product Support Specialists
Systems Analysts

End-User Applications Development

Wilton Rooks,
General Manager
Systems Division

We develop and implement minicomputer systems for Data General customers desiring single vendor responsibility. You will be a part of the development staff. In support of systems sales you will develop proposals, analyze customer requirements and make presentations to our customers. I'm interested in candidates who have experience in selling and implementing complete computer systems. Maybe you have a strong background in either business systems, distribution, remote data entry or networking. These are the positions I'm interested in filling in both Boston, Mass. and Anaheim, Calif.

Systems Division Manager
(San Francisco)

Senior Systems Analysts
Systems Analysts
Senior Programmers (Cobol)
Programmers

Sales/Customer Software Support

Steve Gaal, National Manager
Field Software Support

Our department provides pre- and post-sale software support on a national basis to the field sales force and to Data General customers. We're responsible for proposals and presentations, systems software installations and customer software development. I'm interested in candidates who are independent contributors right through managers. And I have openings in major metropolitan areas throughout the country as well as our corporate headquarters in Westboro for these positions.

Software Support Managers
Software Support Specialists
Software Systems Engineers
Contract Programmers
Headquarters Product Support Specialists

These openings exist in the following cities:

Westboro and Wellesley, Mass., North Branford, Conn., Albany, Buffalo and New York City, N.Y., Blue Bell and Carnegie, Penn., Wayne, N.J., Chicago, Milwaukee, Detroit, San Fernando Valley and Palo Alto, Calif., Phoenix, Dallas, Atlanta, McLean, Va., Baltimore, Seattle, Denver, and Ottawa, Canada.

If you happen to see this advertisement after the interview dates specified, you're not too late. You can apply for any one of these positions simply by sending your resume to the Personnel Department, Data General Corp., 15 Turnpike Rd., Westboro, MA 01581, Dept. CW-2.

Mini Bits

Grosch to Present Keynote At Wang Users Conference

LOWELL, Mass. — Wang Laboratories, Inc.'s Society for Wang Applications and Programs (Swap) will meet Oct. 31 through Nov. 2 in Boston, according to a spokesman.

A variety of presentations, workshops and panel discussions will be presented. Dr. Herbert R.J. Grosch, president of the Association for Computing Machinery, will be the keynote speaker.

Special training courses will also be offered. Further information is available from Swap, Wang Laboratories, Inc., 1 Industrial Ave., Lowell, Mass. 01851.

Incosan Unveils PDP-8 Interface

SPARTA, N.J. — Incosan, Inc. has a single serial interface board it said is capable of driving three serial devices from one Omnibus slot in a Digital Equipment Corp. PDP-8/A or PDP-8/E system.

The unit is a standard quad-height board with three DEC-type serial interface connectors attached to it. Serial devices are plugged directly into the board.

The Incosan board is particularly suited to a DEC VT50 or VT52 Teletype-replacement CRT, but any standard 20mA Teletype replacement is compatible, Incosan said.

The board is software-compatible with the standard PDP-8 keyboard/printer instruction set and can be operated without software modification, the firm claimed. It costs $695 from Incosan at 160 Woodport Road, Sparta, N.J. 07871.

RDA Has Unit for Educators

BELTSVILLE, Md. — The PRD11 system from RDA, Inc. is a portable unit based on the Digital Equipment Corp. LSI-11 and designed for educational and data acquisition applications.

The PRD11, which includes the LSI-11 and 56K bytes of random-access memory (RAM), is packaged in a 23-lb suitcase configuration, a spokesman said.

The unit can handle up to four Basic langauge users. In data acquisition applications, it can accommodate up to 64 analog and digital channels, the spokesman noted.

The PRD11 with 32K bytes of memory and a serial line interface costs $4,950.

A typical system with 56K bytes of RAM, fixed and floating arithmetic, serial I/O, Linc tape mass memory, Texas Instruments, Inc. TI 745 portable printer terminal and DEC RT11 operating system costs $11,790 from RDA at 5012 Herzel Place, Beltsville, Md. 20705.

More Tasks Off-Loaded

Citibank Proofing Operation Gets Minis

By Esther Surden
Of the CW Staff

NEW YORK — In yet another application, Citibank here has replaced a system formerly running on a large IBM mainframe with five minicomputers.

Called Citiproof, the application is part of a larger integrated customer transaction, financial service reporting and corporate accounting system due to be implemented soon. The Citiproof application handles more than $12 billion in transactions daily using 160 proofing centers.

The system captures about 75,000 detailed transactions of corporate customers each day and provides summary records of more than two million corporate and personal checking transactions.

In accordance with Citibank's corporate philosophy of decentralization "we almost out of necessity had to go the minicomputer route," according to Brian Trainor, vice-president in charge of implementing the Citiproof system.

Prior to the installation of the minis, the bank performed the application on an IBM 360/158. "Every department in the bank would submit a handwritten proof and those proofs would be keypunched and run into the 158, where they would be edited and the general ledger updated. We discontinued that in August of last year," Trainor said.

Digital Equipment Corp. PDP-11/70s were chosen as the minis to handle the application "really on the basis of our experience with DEC," which Trainor described as "quite extensive.

"At the time we had about 30 DEC systems in the bank and had written a lot of general software on the system," he explained. It also turned out the software vendors with which the bank was most familiar and in which it had the most confidence were vendors with experience on DEC equipment, Trainor said.

Application software for the system was written by Cibar, Inc. of Colorado Springs, Colo., in conjunction with Citibank Operating Group personnel.

Cibar also had experience in the bank and had been in the bank for two years prior to the development of Citiproof. "They are a very small outfit, but very very good. We have found them to be creative, innovative and very reliable," Trainor stated.

Two of the bank's people worked with three of the vendor's people in a development effort that lasted only six months.

"We actually began programming during the month of January and ran parallel during the month of July," Trainor recalled.

The five PDP-11/70s at Citibank each have 192K bytes of memory. Eventually, there should be six of the systems handling the function and five more handling a management information system (MIS) and accounting system function, he said.

The Citiproof application merely acquires the data for accounting and captures information about each individual transaction. The information then must be fed into the accounting system and the MIS system so "we can assure that MIS data and accounting data when reported is at least reconcilable."

The minis can communicate with each other, Trainor noted. The Citiproof systems are written under DEC's RSTS operating system and "we have an RSTS-to-RSTS communications capability so we can transmit files or records between the systems," he added.

The bank is developing an RSX-to-RSX communications capability as well, because the accounting and MIS systems are written under that operating system, he explained.

The next step, he noted, is to "develop an RSTS-to-RSX capability that will make us totally able to communicate between systems."

Interdata Configures Systems For Scientific Applications

OCEANPORT, N.J. — Interdata Inc., has configured two of its systems specifically for scientific users.

The Laboratory System-16 (LS-16) includes a 16-bit Interdata 5/16 processor with 48K bytes of memory, dual floppy disk drive, CRT console terminal and 16-channel analog-to-digital converter. The unit runs under Interdata's OS/16 MT2 foreground/background operating system and features Extended Fortran IV, a spokesman noted.

Because the LS-16's micro bus is compatible with Intel 8080 and Motorola 6800 microprocessor logic, the system can serve as a central laboratory computer to control microprocessor-based instruments or peripherals, he claimed. It can also communicate to a larger host processor.

The larger of the two systems, called the Fortran Processing System, includes a 32-bit Interdata 8/32 processor with 256K bytes of mainframe memory, floating-point hardware, bootstrap loader, 10M bytes of disk, CRT console terminal, the OS/32MT multitasking operating software and Fortran VI, the firm said.

It is suited for users who wish to develop and execute Fortran programs, the company noted, and can execute programs with large data arrays.

The system was designed for linear programming modules, matrix manipulations and image-processing applications and will fit the needs of users in industrial research, biomedical and biochemical engineering, it added.

The LS-16 system costs $15,425 while the Fortran system costs $75,000. Interdata is at 2 Crescent Place, Oceanport, N.J. 07757.

Datapro Sees Speed Top Factor For User Picking Mini Printer

DELRAN, N.J. — Speed of operation is the overriding criterion for minicomputer printer selection, according to a report called "All About Minicomputer Printers" from Datapro Research Corp.

"Because speed is the first consideration, it is unfortunate that printer speed can be difficult to evaluate. The reason is that a printer's effective speed frequently depends on factors to which it is difficult to assign values," according to the report, which evaluated 315 models of minicomputer printers from 96 vendors.

Effective speed "can depend on the distribution of characters in the text to be printed, the number of characters in the text to be printed, the number of characters in a line and the layout of the form being printed," the researchers said.

Although a complete discussion of the factors involved in evaluating the speed of printing devices was deemed beyond the scope of the Datapro report because of the complex mathematics involved, the firm did highlight some areas for the prospective user to consider.

User Consideration

"The usual approach to evaluating performance of mechanical devices is to determine the basic cycles or repetitive actions and go from there." However, this presents a problem in the printer area, according to the report.

The logical cycle may not agree with the basic machine cycle. For example, the time it takes to print a line and space to the next line may not match one revolution of the drum or one circulation of the print train,

(Continued on Page 48)

Now you can get our disk systems within 30 days ARO at the industry's lowest prices:
• 80 Mbytes for under $12K*
• 300 Mbytes for under $20K*

Field-proven reliability, total software support and 30-day delivery. You've come to expect them all from us. And that's why we've become the world's largest independent supplier of minicomputer disk storage systems.

Now add low price. Lower than the minicomputer manufacturer, lower than any other independent—*the lowest in the industry*. Why? Because we buy more disk drives than anyone else, and we can afford to pass the OEM discounts on to you.

The low prices listed are for complete disk systems ready to plug into your minicomputer. Each system includes our high-performance controller, an appropriate minicomputer interface and the software of your choice.

When you buy disk systems from us, you'll save a lot more than a lot of money on the purchase price. You'll save precious time. Beginning with our 30-day delivery and continuing with our responsive, customer/software support, we'll get your system up quickly—and keep it up. For complete OEM pricing information and technical details, contact the System Industries representative in your area.

* OEM prices: 40-69 systems.

Can't Be Resold

System 34 Licensed Software Policy Worries MIC

CHERRY HILL, N.J. — The IBM System 34, which is bound to be a serious contender for the user's dollar, pulls some surprise punches, according to a report by Management Information Corp. (MIC).

"What surprises us is the fact that IBM announced the System 34 . . . fully nine months before its January 1978 delivery date," the firm said in the June issue of *Small Business Computer News*.

"What worries us," the report continued, "is that with the System 34, IBM has joined with NCR and Burroughs in a new pricing policy whereby systems software cannot be purchased with the hardware, but is licensed to users and paid for on a monthly basis.

"In other words, the user who purchases a System 34 will not be able to sell the system with operating software; whoever buys it will have to go back to IBM for such software."

The System 34 is more powerful and versatile than the 32, but it is also more expensive if entry-level configurations are compared, the article noted.

A System 34 configuration with 32K bytes of memory, 8.6M bytes of disk, a diskette and a 40 char./sec printer costs $1,200/mo compared with $1,000/mo for a comparably configured System 32.

"With the System 3, the comparison is more delicate since the various models of the System 3 have different capability mixes. Generally speaking, the System 34 is not as powerful as some models of the System 3, but it is faster and more versatile," MIC said.

The following are some comparisons with the IBM 3 made in the article:

- Memory cycle time: The System 34 is twice as fast as the System 3.
- Storage capacity: 65K bytes for System 34 vs. 263K bytes for System 3.
- Operating system: The System 34 is true multiprogramming with up to eight concurrent programs; System 3 is a dual-partitioned multitasking system, not multiprogramming.
- Number of terminals: Up to eight for System 34; up to 30 for System 3.
- Disk system: System 34 uses a fixed disk with 27.1M bytes maximum capacity and 45 msec average access time, which is larger and faster than System 3 models 4, 6 and 8, but not as good as the larger models.
- Application software: The System 34 can use System 32 application software; the System 3 cannot.

A copy of the report can be obtained for $7.50 from the publisher. *Small Business Computer News* is available monthly on a subscription basis for $51 per year from 140 Barclay Center, Cherry Hill, N.J. 08034.

Unico System Based on 8K Mini

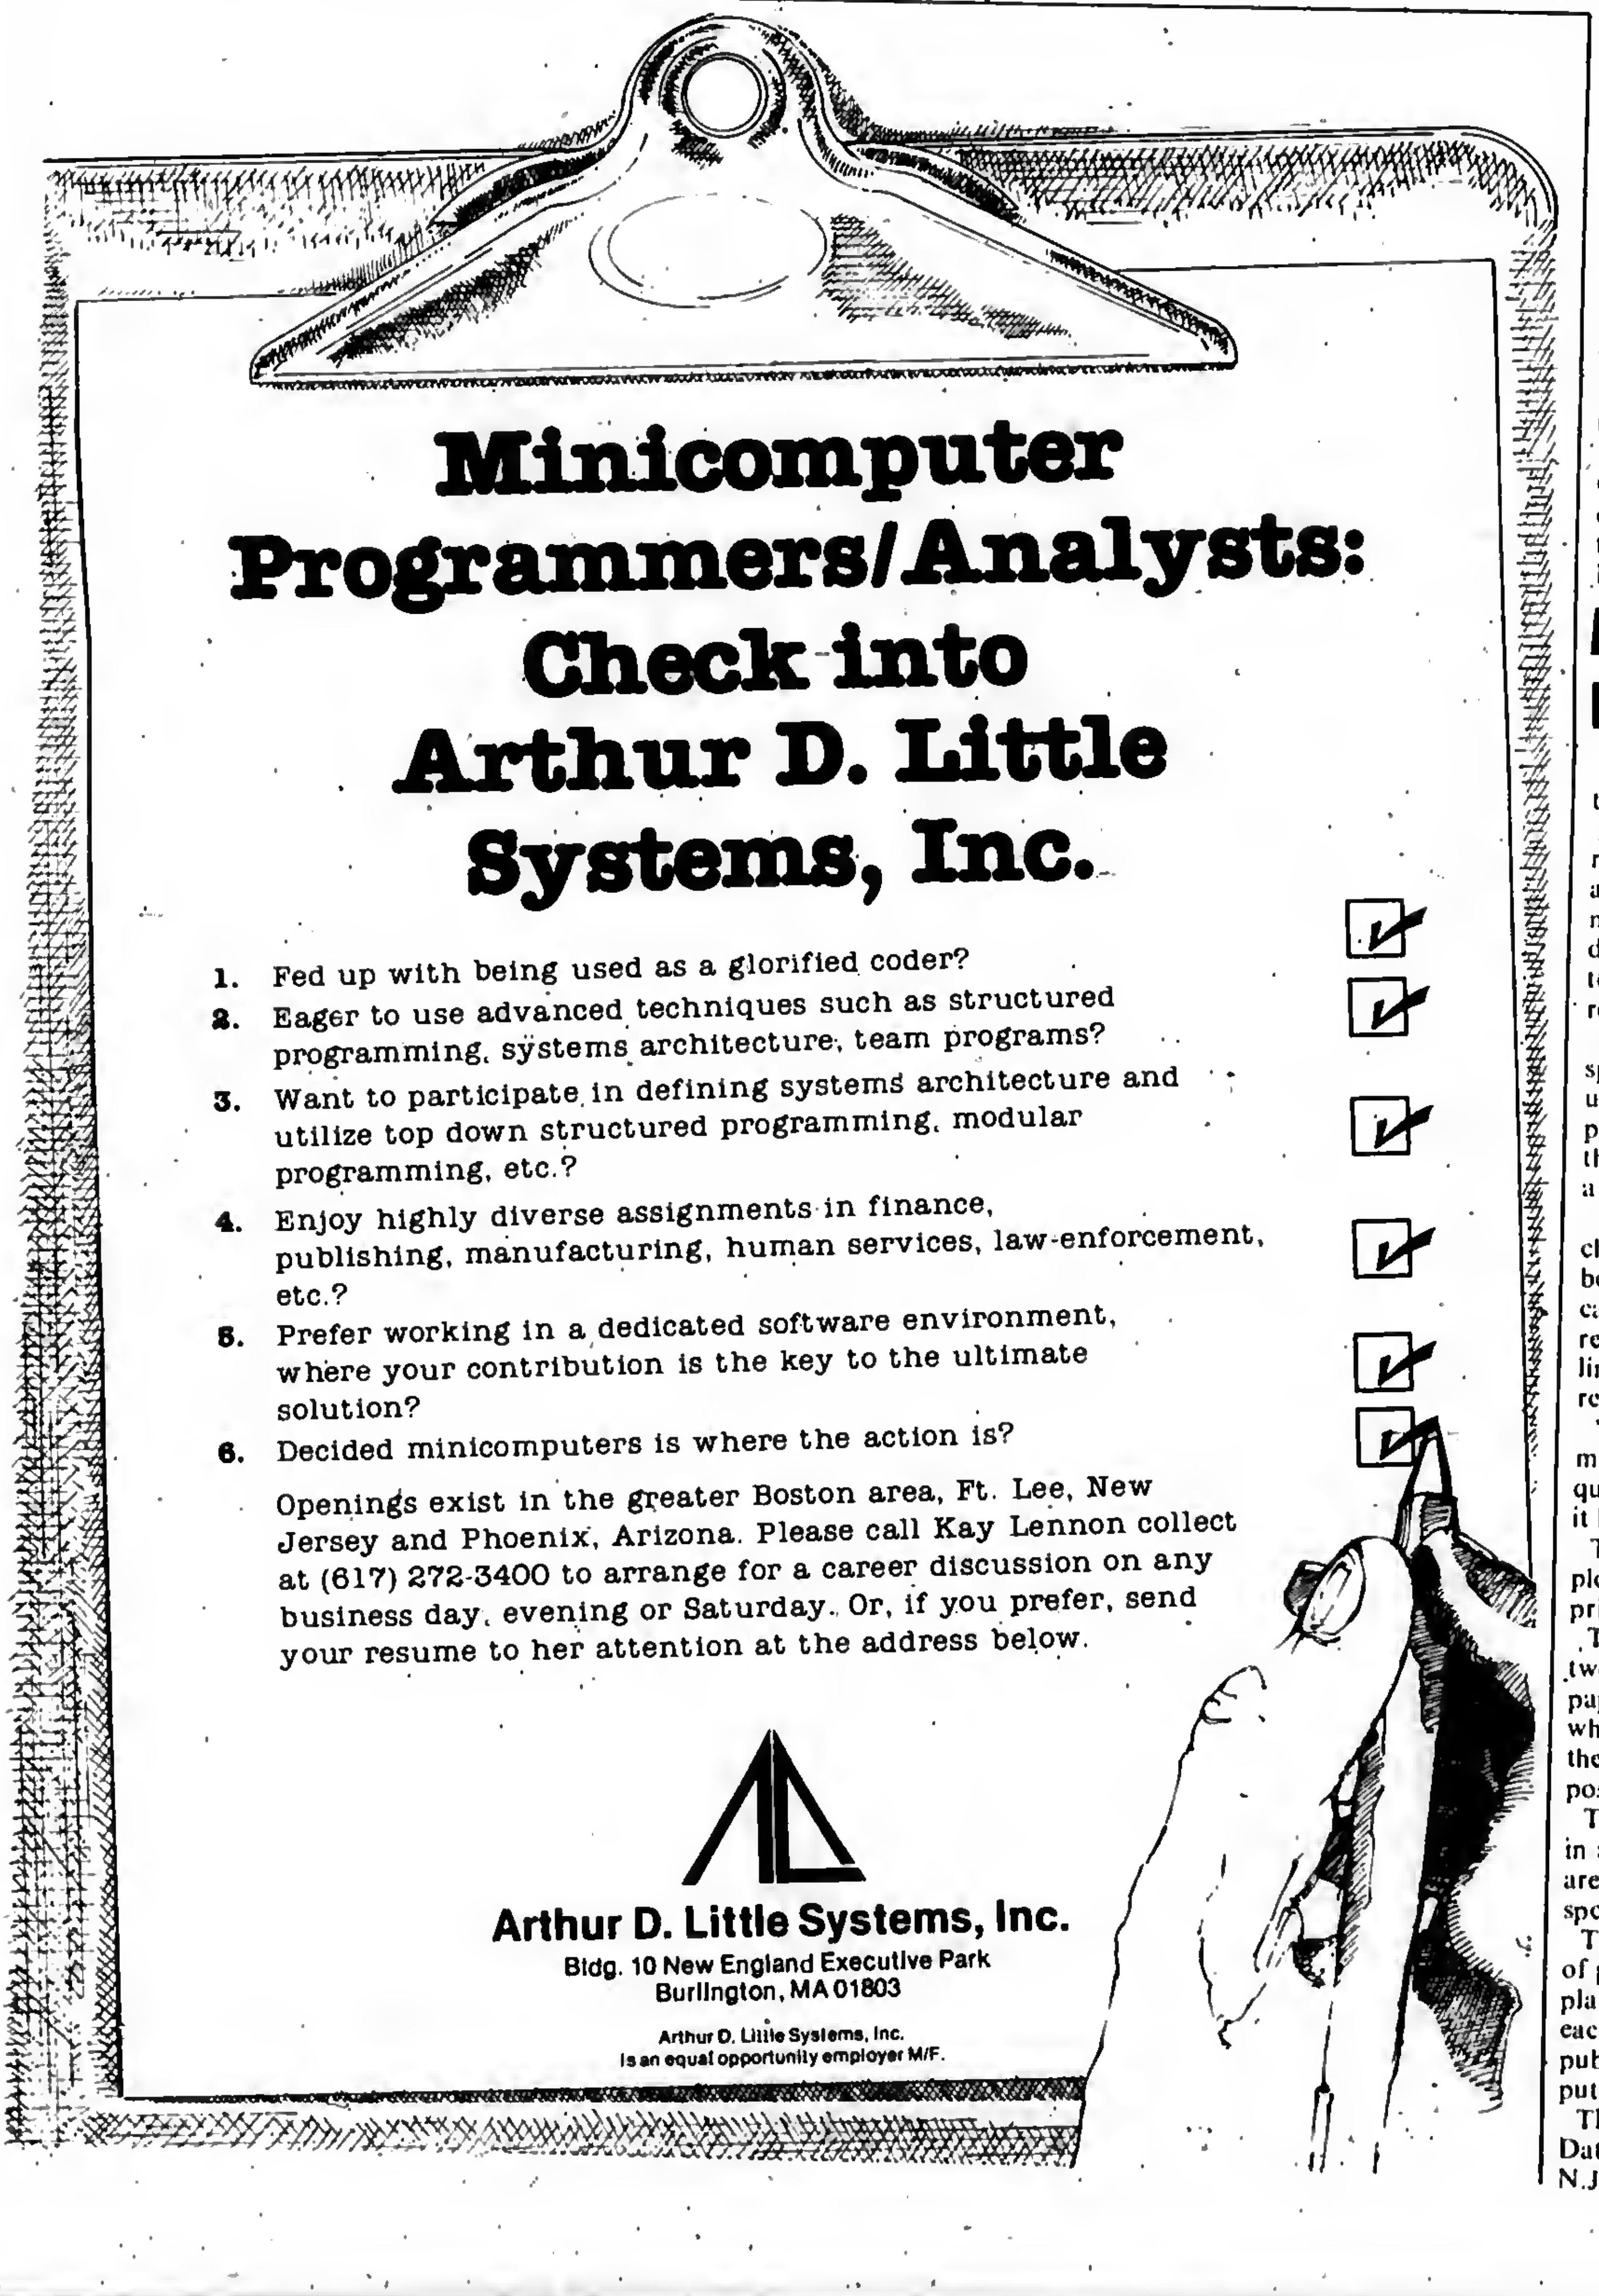
FRANSVILLE, Wis. — The Unico, Inc. System IV Direct Numeric Control unit is based on a single-board 8K minicomputer.

Designed for use in materials handling, food and drug processing and measuring and gauging applications, the System IV uses Unico Real-Time System software. It is said to offer the size and convenience of a programmable controller with the flexibility of a general-purpose system.

Three modes of operation are available. The test mode is used for diagnosing hardware and software problems; the load mode to enter diagnostic programs, application programs and system data; and the run mode for normal system operation, Unico said.

Memory on the system can be expanded to 32K words of data and instruction storage, the company noted. The system recognizes the instructions of the Digital Equipment Corp. PDP-8 mini, a spokesman added.

The System IV costs $17,258 for an 8K CPU, keyboard, display, paper tape reader, data I/O station, power supply and data interface module. Unico is located at 3725 Nicholson Road, Fransville, Wis. 53126.



Minicomputer Programmers/Analysts: Check into Arthur D. Little Systems, Inc.

1. Fed up with being used as a glorified coder? ☑
2. Eager to use advanced techniques such as structured programming, systems architecture, team programs? ☑
3. Want to participate in defining systems architecture and utilize top down structured programming, modular programming, etc.? ☑
4. Enjoy highly diverse assignments in finance, publishing, manufacturing, human services, law-enforcement, etc.? ☑
5. Prefer working in a dedicated software environment, where your contribution is the key to the ultimate solution? ☑
6. Decided minicomputers is where the action is? ☑

Mini Printer Speed First Consideration

(Continued from Page 47)

the report explained.

For a character-at-a-time printer, the time required to print a character depends on the arrangement of the printing mechanism and may be constant for all characters or vary depending on the location of the character to be printed on the printing element, the report continued.

Character printers usually run at the speed of the slowest character to achieve a uniform printing rate. "Thus, the average printing rate is the time required to return the carriage and the time required to space a line."

Keeping this in mind, the average speed in char./sec for a highly formatted form could be lower than the quoted peak speed or, because substantial time savings can be realized for short lines, the speed quoted in line/min "could be quite respectable," the researchers noted.

"As a rule of thumb, frequent short lines make a character printer look good and frequent line-spacing operations tend to make it look bad," they added.

The design and execution are more complex for a line printer than for a character printer, Datapro noted.

They are dependent on coordination between the printing, usually done while the paper is moving, and the logical operations, which compare the contents of a buffer in the printer to the character coming into position for each print column, it explained.

The number of different symbols printed in a line and the size of skips between lines are the basic factors affecting line printer speed, Datapro reported.

The report identifies all the various types of printers and printing techniques and explains advantages and disadvantages of each. In addition, specifications are published on various vendor's minicomputer printers.

The 73-page report costs $12 from Datapro at 1805 Underwood Blvd., Delran, N.J. 08075.

COMPUTER INDUSTRY

CI Notes

SBS Puts Out Bid Request For TDMA Burst Modems

McLEAN, Va. — Satellite Business Systems (SBS) has issued requests for proposals for the design and manufacture of high-speed time-division multiple-access (TDMA) burst modems for its communications satellite earth stations.

SBS asked for fixed-price proposals for delivery within 12 months of five prototype modems — four equipped for operation at 48M bit/sec and one equipped for operation at 43M bit/sec.

SBS said it contemplates the award of contracts to two manufacturers whose modems will be subjected to competitive evaluation by SBS. Each manufacturer would keep two modems for life testing at its facilities and deliver three to SBS for field trials.

Responses are due within 60 days to SBS at 8003 Westpark Drive, McLean, Va. 22101.

Documation Cuts Personnel

PALM BAY, Fla. — Documation, Inc. has laid off a portion of its production, engineering and administrative personnel at its main manufacturing facility here.

In conjunction with the reduction in its work force, remaining employees here are being asked to schedule their vacations so they fall in the company's second quarter ending Aug. 12.

A spokesman for the company said the personnel reduction is intended to bring inventories in line with sales projections for the second quarter.

Raytheon Plans Terminals

BURLINGTON, Mass.— Watch for Raytheon Data Systems' new line of terminals which it said will be competitive with the IBM 3274 and 3276 in both features and price. The line should be revealed in mid-August.

Supershorts

Rockwell International and Sharp Electronics of Tokyo have signed a licensing agreement under which Sharp will manufacture and market Rockwell's line of PPS-4 and PPS-8 microprocessors.

— — —

BOC Datasolve, Ltd. has acquired the exclusive marketing rights in the UK to the computer application systems of McDonnell Douglas Automation Co.

'No Technology Transfer'

CDC Defends Wisdom of Cyber Export

By Toni Wiseman
Of the CW Staff

WASHINGTON, D.C. — The government's refusal to permit export of a Control Data Corp. Cyber 76 to Russia invovles no transfer of technology, does not represent a threat to national security, and could result in social and economic damage, according to testimony presented before the International Economic Policy and Trade Subcommittee.

The Commerce Department blocked the sale on the grounds that the computer, destined for weather forecasting applications, could be put to military uses. CDC termed the denial "political" [CW, July 4].

"The refusal of the United States government executive agencies with responsibilities in this matter to allow us to correct the misunderstandings of the case should be seen for exactly what it is: an evasion of their statutory responsibilities," Robert D. Schmidt told the House Committee on International Relations.

Schmidt, who is executive vice-president and member of the board of directors of CDC, stated that export license denial on national security grounds is to be made only when the export would make such a significant contribution to the military potential of the importing country as to be detrimental to the U.S.' national security. CDC, he added, "simply cannot accept the premise that our national security is so precariously balanced and thinly protected as to be threatened hy the export of this computer."

Supporting Points

CDC's testimony contained six main points:

- There is an important and legitimate need for a computer of the size and capability of the Cyber 76 to be installed in Moscow.
- There is no reason to believe the USSR will use the computer for any but the stated end use.
- Conditions and safeguards can he applied to the computer that will minimize the possihility that operation of the machine could be diverted from its authorized weather data function.

CCIA Warns of Grave Dangers From De Facto EFT Standards

By Toni Wiseman
Of the CW Staff

WASHINGTON, D.C. — The Computer & Communications Industry Association (CCIA) said it supports several recommendations put forth in the National Commission on Electronic Fund Transfers (EFT) working papers, but urged that body to reconsider its position on industry standards.

In recent testimony before the commission, the CCIA endorsed deregulation of EFT equipment, limiting regulation to the transparent communications network and maximum separations approach for EFT services.

It warned, however, of grave dangers in the working paper's de facto standards proposal.

"While we agree with the commission that 'federally' mandated standards, in the sense of technical standards developed and enforced by a federal standards body, for EFT terminals and systems may not be appropriate at this time, still, in looking at the nature of the evolving EFT marketplace, we believe firmly that industrywide standards are a necessity," the testimony stated.

The CCIA supported comments offered last March by the American National Standards Institute Standards Committee, which noted "the success of EFT is dependent upon development of standards . . . which will make possible nationwide or international interchange. Well-developed standards will promote the participation of large and small suppliers in providing equipment to the users."

While agreeing with the EFT commission's conclusion that mandating standards would be contrary to the principle of minimum regulation, the CCIA suggested the only alternative is not a situation that merely requires any company achieving market dominance to publish its standards in a timely fashion.

"Rather than proposing a solution of such questionable worth and enforceability, CCIA believes [the commission] should call for the creation of a federally chartered or-

Printer Industry Gearing Up For Likely Market Shakeout

By Molly Upton
Of the CW Staff

DALLAS — As the larger printer manufacturers rush to expand their lines with both higher and lower speed printers, many exhibitors at a recent conference here agreed there could be a shakeout in the industry before too long — if it has not already hegun.

Others are scurrying to establish themselves in particular niches in the marketplace.

The printer makers seemed to have the lion's share of new products on the exhibit floor, with many of the products representing new ventures in either speed or technology for particular firms.

"The shakeout is already happening," according to Chandler Williams, manager of business systems for Tally Corp. "There are a lot of little guys not doing much," he explained.

Ben Taniguchi, vice-president of sales for Dataproducts Corp., said he thinks there will be a shakeout. The key to survival lies in the ability to provide a full spectrum of user needs, he added.

George Rea of Centronics Data Computer Corp. said it is hard to say specifically whether there will be a shakeout. However, he added, the printer market "is certainly competitive, and families of products need to he extensive.

"Users demand flexibility, and if you don't have the range, it's difficult to compete."

However, Melvin Litvin, president of Data Printer Corp., disagreed, observing there are more firms getting into the line printer business now than in the past, and the market seems to he able to support them.

Ron Huch, president of Dataroyal, Inc.,

It's only logical that you should consider a used 370/165 while waiting for your new IBM 3033.

While you're waiting up to two years for delivery of a new IBM 3033, you can increase your processing power and save money. Just lease or buy a used 370/165 from COMDISCO.

Twice as fast as a 370/158, yet only half the cost, a used 370/165 from COMDISCO makes a lot of sense. When you re-think about it, why wait to get more computer power at less cost? A 370/165 from COMDISCO is the logical choice.

Re-THINK

Write today or call your nearest Comdisco office.

Five-Year-Old Firm

Prime Chalks Up Its First Positive Retained Earnings

By Molly Upton
Of the CW Staff

BOSTON — After five and a quarter years of operation, Prime Computer, Inc. has achieved positive retained earnings, President Kenneth G. Fisher told stockholders here recently.

With the first quarter of 1977, the mini maker had $500,000 in retained earnings, thus marking the firm's transition from a "highly leveraged" firm to a "solid, almost conservative company," he remarked.

Earnings for the quarter totaled $732,000 including a $150,000 credit, compared with $365,000 including $177,000 in credits in the same period last year. Sales grew 135% to $9.3 million compared with nearly $4 million in the year-ago quarter.

The balance sheet in the second quarter of 1975, when Fisher assumed his position at Prime, showed negative worth of $3.1 million, he said.

The cash position on the balance sheet has also improved, from $75,000 in the second quarter of 1975 to $1.3 million in the first quarter of 1977, he added.

The firm is in the process of finalizing a $20-million line of credit with several major banks. Currently it has a $10 million line with the First Pennsylvania Bank, he said.

Although Fisher said he won't preclude another equity offering, it will not be in the immediate future. "It will be some months," he predicted.

Solid Megamini Market

Prime's products fall in the higher end of the mini spectrum, and the market for megaminis is very firm and very solid, Fisher observed.

The firm's thrust is to offer large-scale functionality for mini prices, and no one else is really doing this, Fisher said. Thus, the market is fairly elastic.

However, the low-end mini arena is becoming a price market, which the firm intends to avoid, he added.

Prime's interactive minis range from OEM systems to the Model 500, introduced this year.

An increasing portion of Prime's shipments consists of larger systems to the end-user community, Fisher said.

The average value per unit shipped increased 64% to $37,600 in 1976, and the average price of systems sold incorporating a Model 400 was $132,200, according to the annual report.

Prime is intentionally stabilizing its OEM and data acquisition/collection business, Fisher added.

In 1976, about 70% of product revenues came from the business DP and computational processing markets, which contributed 33% and 37% respectively, according to the annual report.

The firm's largest single customer is Linotype-Paul Ltd., which accounted for 12% of product sales during 1976. Prime's five largest customers accounted for 38% and 31% respectively of sales for 1975 and 1976, the report indicated.

During 1976, the end-user customer base grew 58% with new-name accounts. Those new-name accounts ordered 82% of all end-user systems sold for the year, Fisher noted in the report.

Prepared to Lead

Prime, which provides systems software rather than applications software, sees the increasing importance of software as a plus, since it is "quite prepared" to be a leader in the systems software area, Fisher said in response to a shareholder's question.

Present production capacity, which recently doubled, should be adequate through sales of $100 million, Fisher said, adding the firm is getting more plant production per square foot because of the sale of larger systems. Prime recently added 75,000 square feet to its facility in Framingham, Mass.

During 1976, sales doubled to $22.8 million from $11.4 million, largely as a result of the sale of larger systems and an expansion of the marketing organization from 74 persons at year-end 1975 to 214 persons at year-end 1976, the report said.

Gross margin increased to 54.6% in 1976 from 49.1% in 1975.

Cost of sales as a percentage of revenues fell from 50.9% in 1975 to 45.4%. Although expenditures for product development and engineering increased in dollars to $1.6 million in 1976 from $876,000 in 1975, they decreased as a percentage from 7.7% to 6.9%, the report indicated.

However, Bill Poduska, vice-president, research and development, said in an interview that R&D expenditures are expected to track around 7% of sales or a bit higher, since marketing expenditures are not expected to grow at their previous rate.

Prime's international order rate has been holding at 40%, despite economic problems in various countries, Fisher said.

Established Firms 'Missed Retail Boat,' Panel Agrees

By Toni Wiseman
Of the CW Staff

DALLAS — Almost every company that has a significant place in the retail DP market today was not in business three years ago, while those firms which have been around for years missed the "retail store boat," according to a panel at a conference here recently.

"Most companies have imagination only once in their careers," Adam Osborne of Osborne & Associates, Inc. said, suggesting the larger, established firms did not have the vision to see the opportunities of a new market.

This new market, Osborne noted, is not wide in terms of functions of new products, but rather new functions or applications of old products.

'Crazy Like Foxes'

When Mits introduced its $500 kit, everyone thought the firm was "nuts," he said. "They were — crazy like foxes."

And Icom, when it begun selling peripherals, had to pay cash for the floppies because its supplier, Pertec, thought so little of the company's prospects. Eighteen months later, "Pertec bought Icom for a substantial price," Osborne pointed out.

Missed Chance

In these and many other cases, the established companies could easily — more easily than a new company — have gotten into the market, but they simply didn't realize the opportunity. "The firms that existed could not see what was coming and did not move in time," he explained.

There is no such thing as a classical hobbyist, he stated. The bulk of retail store business is not from the guy who pays thousands of dollars to play Star Trek, but from systems analysts and others in the industry who are moonlighting in their spare time as consultants, for instance.

Quick Millionaires

"This is a market in which some people will become millionaires in a very short time by producing products which are sorely needed," Osborne said.

He characterized the market as "the last incarnation of the Old West" where there is gold lying on the ground waiting for someone to pick it up.

"For the next nine to 12 months, you are the first person thinking of something because it just couldn't be done before. So don't limit yourself by thinking it's so simple someone must have already thought of it," he urged.

"The most important thing to remember in the retail market is that this is a new market which is being created, one that never existed before, and it is not servicing past customers or problems.

"You can't try to find a customer base and service its needs because you have to make your market, not fill one," he observed.

Limited Resources

Bruce Venetta of IMS Associates, Inc., noted the problems of the retail manufacturer and its product line are engendered by its limited resources: "There simply aren't a lot to draw on."

And these limited resources must be divided among documentation, hardware, customer support and service, application assistance and system integration, he said.

"It becomes a balancing act — do you provide good documentation on a few products or a wide line of hardware with questionable documentation?" he asked.

Customer Power

"We'd like to do what the customers want us to. They are voting with their dollars, so we usually do what will make us the most money. If we decide wrong, customers don't buy and that tends to get us back in line," Venetta pointed out.

He noted that in the beginning, the way a new company usually got the last bugs out of its system was to spend some time on it in the design cycle and then sell it so the money would start coming in.

At the same time, the vendor would start getting mail from the engineers who had bought the systems and often provided the solutions.

Bigger Than Garage Business

But the retail store of today is more than the garage operation which satisfied the needs of early home computer enthusiasts.

The first Byte Shop, for instance, grossed $8,000 in June 1976, the first month it was open; in October of the same year it grossed $25,000.

Byte Shops' Paul Terrill believes the retail store has become the "life jacket" of the market. As products flooded the market, enthusiasts needed somewhere to turn for configurations and answers to questions.

It's fine to assemble a kit, he said, but after that you have to know how to program and operate it — that's where Byte Shops come in, as a sort of "house doctor."

The question of the impact of retail outlets becomes one of "how you turn a profit out of a $10 item, and the answer is volume," Terrill said.

He left the audience with the intriguing idea that, in the future, computers will be free, just as Gillette sells blades and gives away razors.

Digital introduces DECstation. A big computer system that's small enough for anyone.

Digital put an amazing LSI version of the PDP-8 inside a DECscope, added some ingenious interconnecting devices and created something new. The DECstation. A complete computer system big enough to do all kinds of work and small, simple and inexpensive enough to do it for almost anyone.

DECstation. A complete computer system in disguise. It looks like a terminal, but look again. The DECstation has a powerful general purpose computer, a video terminal, a dual diskette drive, and its own special operating system. What's more, you can hook up two different printers and a second dual diskette drive. Then put the whole thing in a mini-desk, and when you're done you'll have the smallest big computer you've ever seen.

The Video Data Processor. It's the big reason the DECstation's so small. The VT78 Video Data Processor is a computer wrapped in a terminal. Inside the familiar DECscope you'll find an LSI version of the PDP-8 with 16K words (32K characters) of MOS memory and built-in interfaces. Two serial asynchronous ports feature speeds from 50 baud to 19.2 kilobaud. A disk port interfaces with up to 4 diskette drives. A parallel I/O port for printers and custom interfacing provides data transfer rates up to 180 kilobits/sec. All standard.

You can go from carton to computer in less than an hour. If you can push a button, you can run a DECstation. Because one button is all it takes to start things up. The bootstrap and self-test routines are built in.

Put it together, plug it in, and immediately you can begin to run anything from the PDP-8 software library. Which means you start with one of the most comprehensive sets of software tools available in a small system. Including two proven operating systems: OS/78 for stand alone applications and RTS/8 for real-time. OS/78, an extension of OS/8, supports a number of languages, including FORTRAN IV and BASIC. So all you have to do is load the operating system and start programming your application.

Whatever that application, if you're looking for a sophisticated little system, at the right price, and a remarkable OEM tool, consider DECstation. $7995 each. $5436 OEM quantity 50.

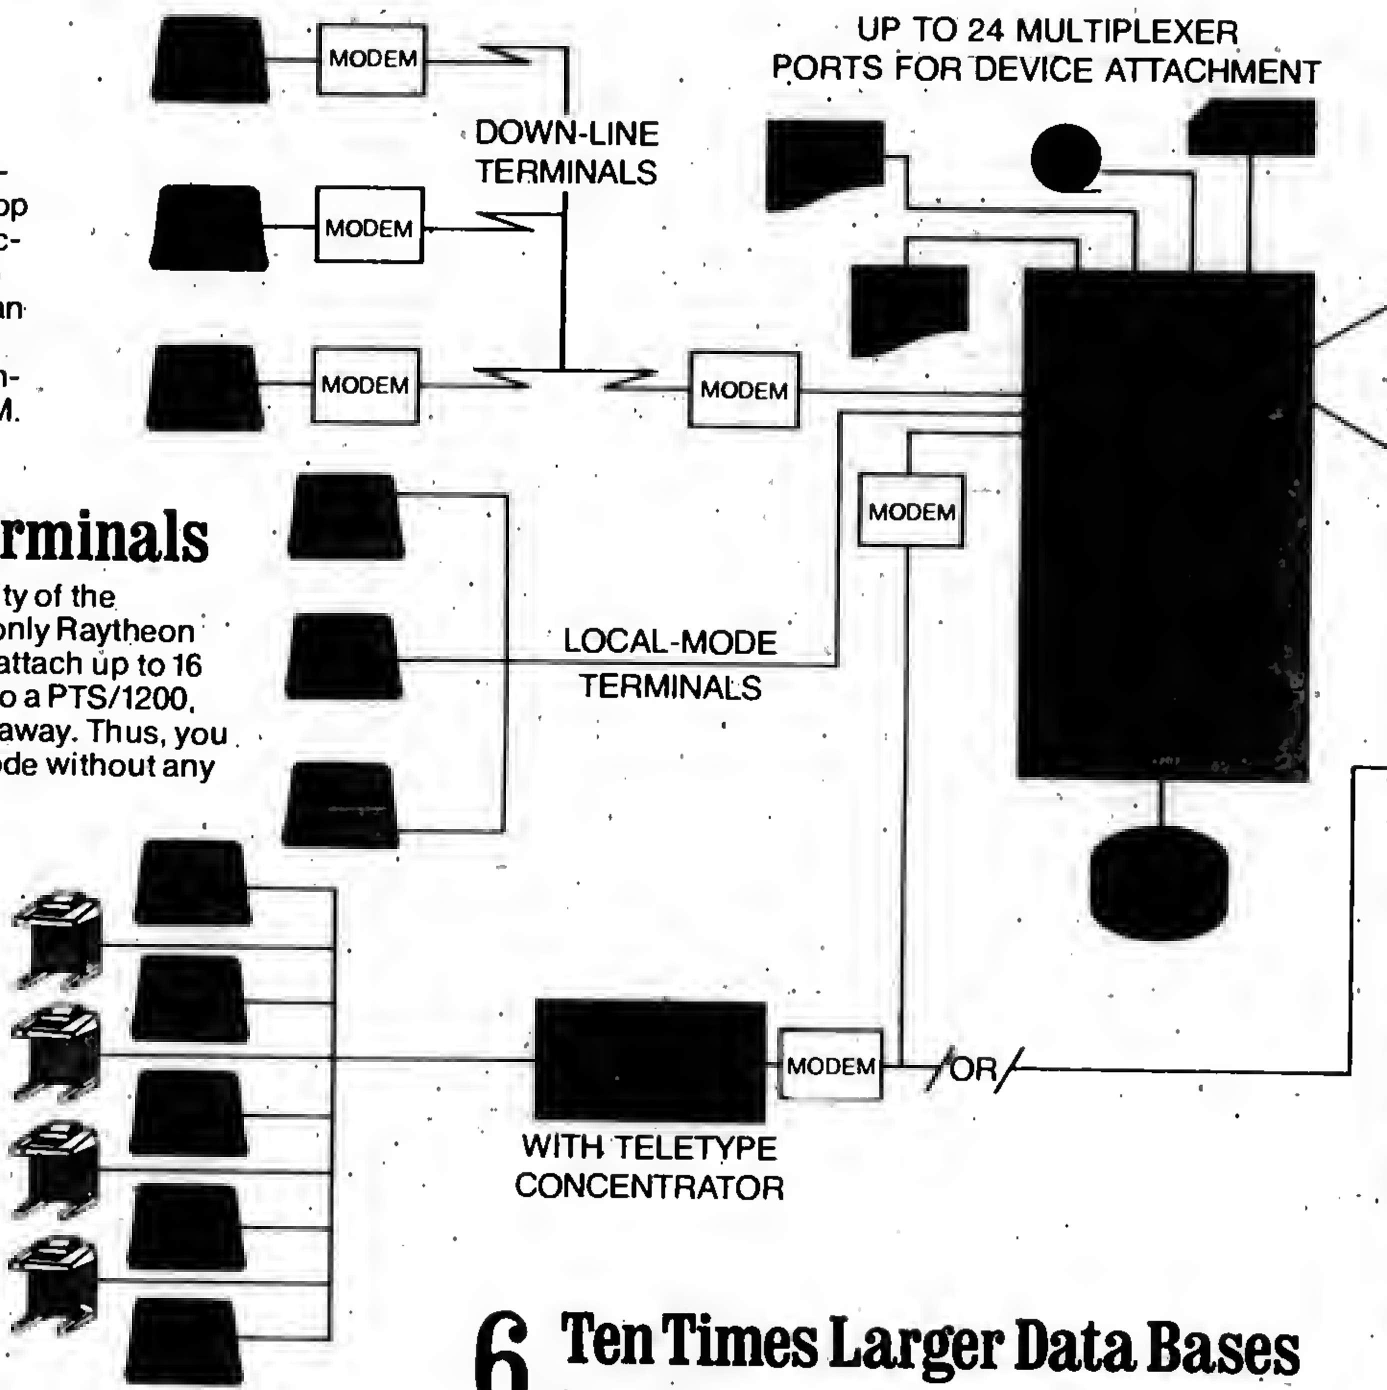
3270/3790 Users:
There were always at least five Now, there are at least ten.

In the past three years, Raytheon has become the largest independent supplier of intelligent terminal and distributed processing system alternatives for IBM 2260, 3270 and 3790 products. Better performance, better pricing, better delivery, greater flexibility and greater intelligence were the capabilities that Raytheon offered. The result: users like yourself purchased more than 20,000 Raytheon terminals and distributed processing systems.

In the past three months, Raytheon has been busily adding more and more capabilities to its PTS-100 intelligent terminal and PTS/1200 distributed processing systems. The reason: to give you more and more reasons to keep buying Raytheon.

Here are ten good ones. Watch this space in coming months for at least five more.



MODEM
MODEM
MODEM
MODEM
MODEM
MODEM
DOWN-LINE TERMINALS
UP TO 24 MULTIPLEXER PORTS FOR DEVICE ATTACHMENT
LOCAL-MODE TERMINALS
WITH TELETYPE CONCENTRATOR
OR

1. Downline Terminals

A brand new capability of our PTS/1200 system that lets you assign the task of multi-drop terminal control, and even applications processing, to a Raytheon system, rather than to your mainframe. Of course, the PTS/1200 can communicate in either batch or interactive modes—or both concurrently—to your mainframe as needed. You can't get this from IBM.

2. Local-Mode Terminals

A long-standing capability of the PTS/1200, and one that only Raytheon offers. It means you can attach up to 16 terminals in local mode to a PTS/1200, at distances up to a mile away. Thus, you get a network in local mode without any TP requirements.

3. Teletype Concentration

Announced two months ago, after more than a year of user operation, this unique feature lets you add teleprinters to the same transmission lines as your 3270-type terminals, with maximum performance and data rates preserved. Know anyone else with this $80 a month feature?

4. Immediate Deliveries

Raytheon has always been known for prompt delivery. We know that when you need it, you want it. There are five new capabilities described in this ad. All five will be in production by June 30th. This year—1977.

5. Lowest Prices

A major attraction of Raytheon alternatives to 3270/3790 has been pricing. Even with IBM's recent price reductions, our pricing schedules permit you to obtain far more capabilities than IBM offers—at rental or purchase rates that are up to 27 per cent below IBM.

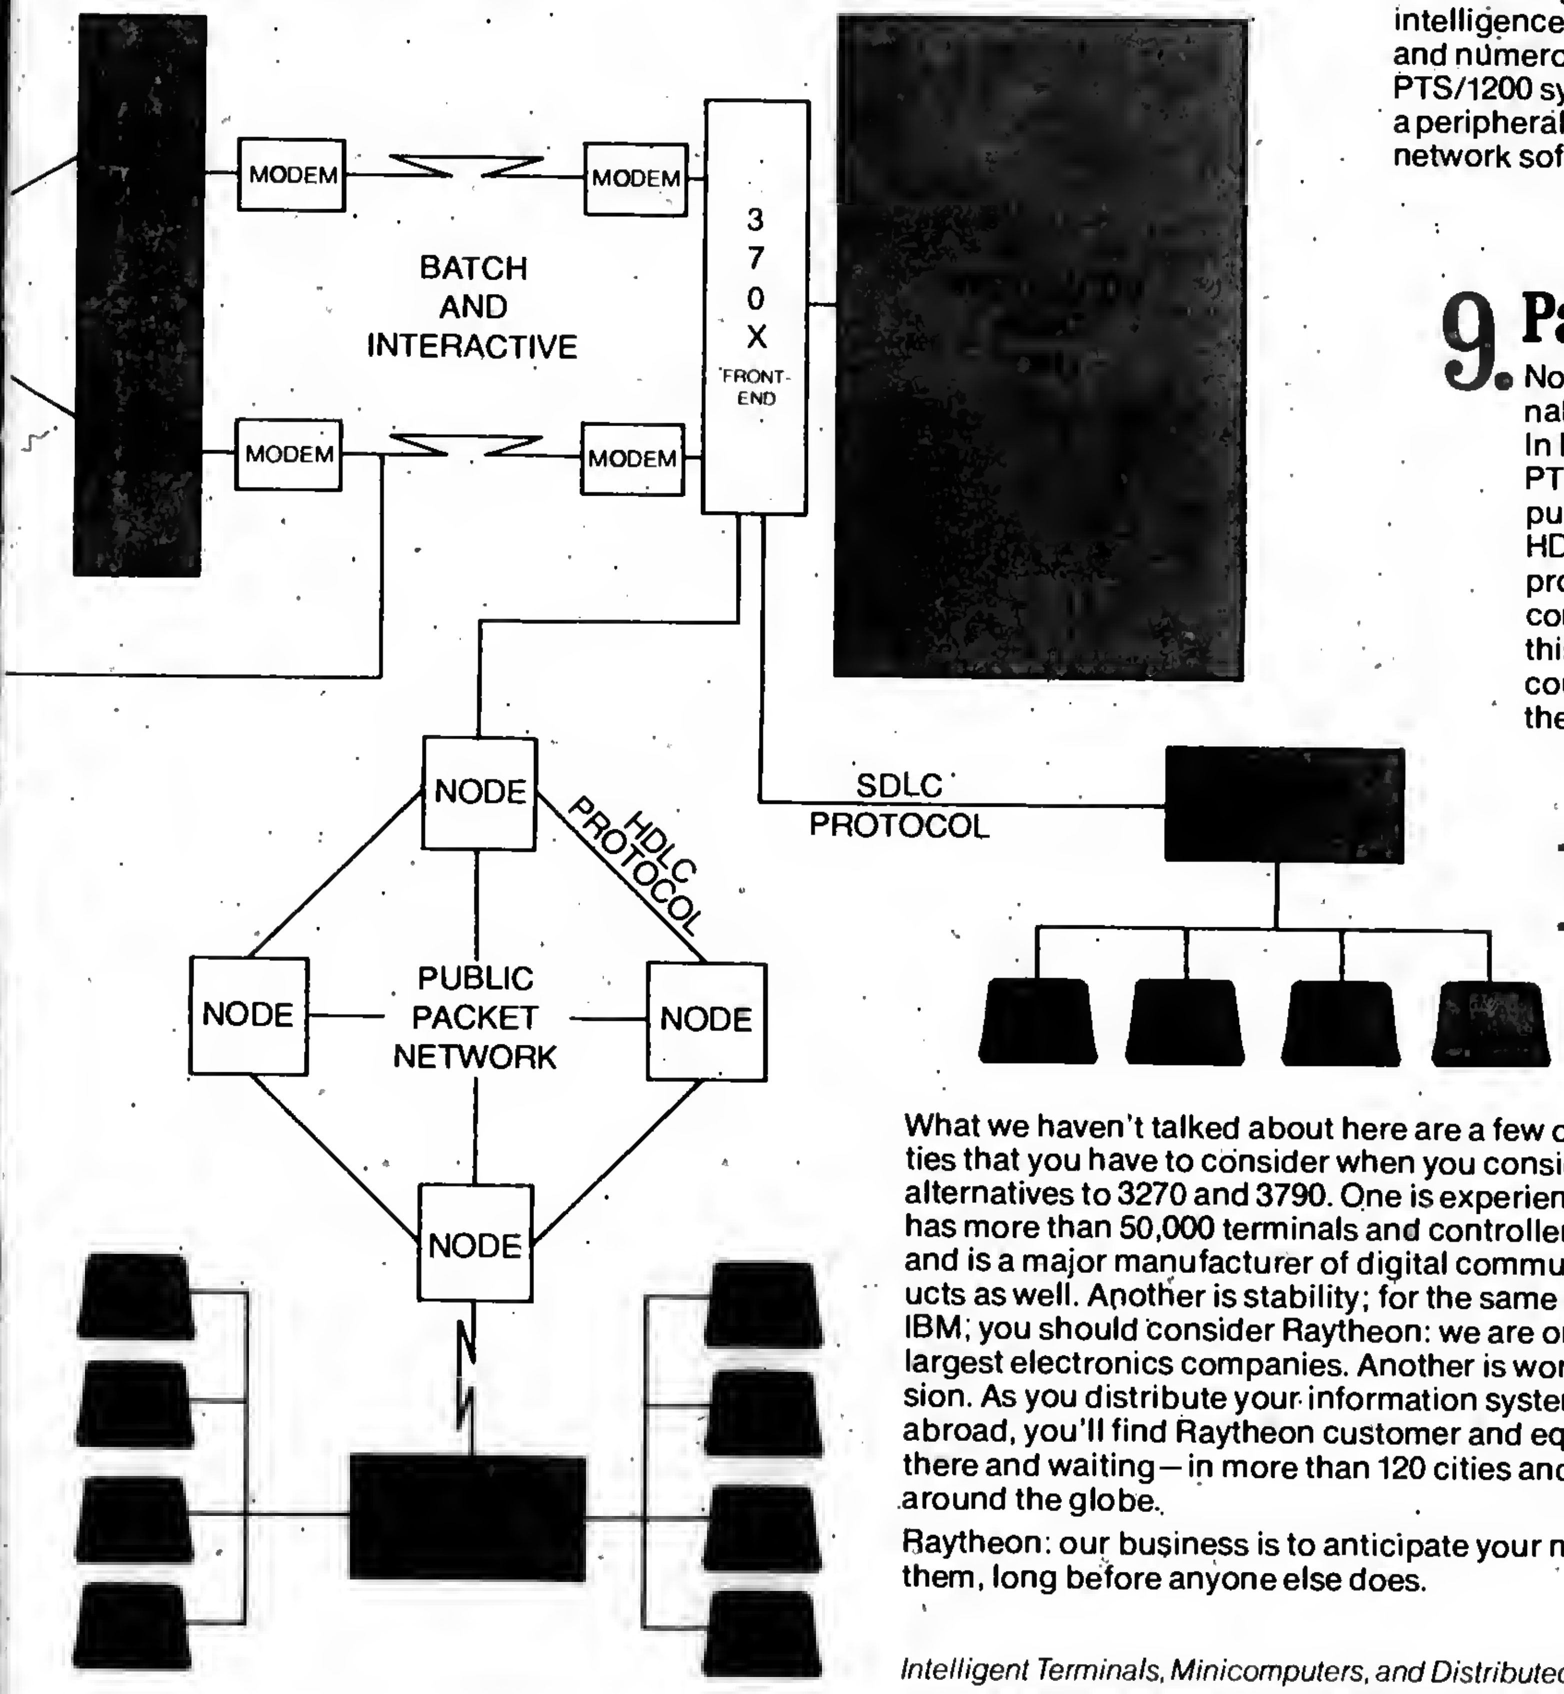
6. Ten Times Larger Data Bases

In a distributed processing system—anyone's distributed processing system—you need disk storage capacity adequate to handle the workloads. Raytheon has just announced a new 320-megabyte disk capacity for its PTS/1200 system. That's 10 times larger than the 3790's.

good reasons to choose Raytheon.

7. Simultaneous Interactive and Batch Communications

Two months ago, Raytheon demonstrated what no one else has—true 3270 concurrency. Our 3270 emulator lets you communicate interactively on a transaction basis with your host CPU. Our 2780/3780/HASP emulator package lets you—at the same time—communicate in batch mode. What counts about that is immediacy: you can do both right now, without any additional applications or front-end software development. And especially, no VTAM or NCP hassles.



8. Total Programming Freedom

This long-standing feature of Raytheon systems needs repeating. Because of the combination of high-level language, very large intelligence capacity, powerful macro routines, and numerous emulators, PTS-100 and PTS/1200 systems treat your host CPU like a peripheral. The result: data networks without network software development.

9. Packet Network Connection

Not with TTYs or ASCII-based terminals, but with 3270-type CRT devices. In March, Raytheon demonstrated its PTS-100 terminals operating on a U.S. public packet network under both HDLC line protocol and X.25 device protocol. We are the only major U.S. company operating such terminals on this international standard in other countries. Now we have it for you in the U.S.

10. SDLC Operation

And yes, every system in the PTS-100 family operates under SDLC protocol if you want it to. Or binary synchronous. Or HDLC. Or 1006. Or 2848/2260. Or Uniscope. Among many others.

What we haven't talked about here are a few other capabilities that you have to consider when you consider Raytheon alternatives to 3270 and 3790. One is experience—Raytheon has more than 50,000 terminals and controllers in use today, and is a major manufacturer of digital communications products as well. Another is stability; for the same reason you like IBM, you should consider Raytheon: we are one of the world's largest electronics companies. Another is worldwide dimension. As you distribute your information systems here and abroad, you'll find Raytheon customer and equipment service there and waiting—in more than 120 cities and 35 countries around the globe.

Raytheon: our business is to anticipate your needs and meet them, long before anyone else does.

CDC Defends Wisdom of Cyber Export to Soviet Union

(Continued from Page 49)

- A much clearer perspective is needed on the question of what constitutes significant output of a computer and on the role of the Cyber in activities of a strategic nature.
- This export involves no transfer of technology.
- There are many other considerations, including social and economic, which should he brought to hear on the decision.

Describing the global telecommunications weather forecasting network (Hydromet) proposed by the World Meteorological Organization, Schmidt noted the Moscow link is critical to the project's sucess.

Hugh P. Donaghue, a CDC vice-president, testified that the Moscow center currently is the lowest powered in the network, and the addition of a Cyber would do no more than bring that center into line with other regional centers.

Schmidt added that, in addition to a detailed set of safeguards to prevent unauthorized use of the computer, the power of the machine dictates that it he dedicated solely to the weather forecasting application.

"It is naive to believe that the Soviets are not rapidly developing ~~an~~ indigenous com~~puter~~ industry. A review of the literature will show that the installed base of computers in the Soviet Union was in excess of 25,000 in 1976 and that annual production is in excess of 5,000 systems per year," Schmidt noted.

Finally, Schmidt suggested several social and economic ramifications of the export.

Americans, for example, are generally uninformed ahout the vast Soviet resource of available technology that could provide solutions to such U.S. problems as improved energy conservation, greater environmental protection and more efficient water conservation, he said.

Cooperative ventures aside, Schmidt indicated that the single Cyber sale represents nearly 600 jobs for one year at CDC alone and more than 100 jobs at firms who supply parts to CDC.

"Seven hundred good jobs certainly are not insignificant, but they are but a small part of what will be denied in the aggregate," he said.

Schmidt estimated that in the next 10 years, the value of the Communist-installed computer base, exclusive of minicomputers, will he $43 hillion, representing an $8- to $10-billion market opportunity for U.S. firms over that period.

By 1985, the U.S. could enjoy sales in excess of $2 billion per year — a level of 100,000 jobs, he noted. An additional $1.2 billion market, of 50,000 jobs, would arise in the peripherals area, he added.

"In addition to the competition from Communist Bloc countries, the Japanese and German competition is going to be tough during these years in both Third World and Communist Bloc markets.

"The decisions being made at this time will largely determine whether or not U.S. computer manufacturers will be able to achieve the potential reasonably available to them," Schmidt told the subcommittee, emphasizing that "denial of the export license for Hydromet will have adverse consequences on future U.S. computer sales."

Printer Shakeout Seen Coming

(Continued from Page 49)

said a shakeout is possible. The market is "getting very competitive, and it's easier to make printers, so a lot of firms are coming in."

Huch's approach is to pick a particular niche in the market and concentrate on it, rather than span a broad range of capabilities.

Although no American exhibitors on the floor were displaying ink jet technology, many indicated they are giving the concept some serious study.

Centronics is "taking a hard look at ink jet printing," Rea said. The firm intends to be a leader in printers and is looking carefully at that technology, he indicated.

Taniguchi said he thinks ink jet technology "will eventually make it," but is not here yet.

Joe Greenwood, marketing product manager for printers at Diablo Systems, said the firm plans to compete with IBM's ink jet technology but by using its daisy wheel and "some other techniques."

Tally expanded its line with a top-of-the-line 500 line/min printer and also added a teleprinter, the T1612, which includes an Intel 8080 and offers features such as a 4K buffer.

Centronics, known for its medium-speed printers, expanded in both directions — adding a 900 line/min printer ~~and~~ an electric discharge printer that operates at 180 line/min over 80 columns.

Data Printer chose to reenter the lower speed portion of its line-printer business with a 300 line/min Chaintrain band printer. Litvin explained the firm previously had a 300 line/min printer, but it did not gain market acceptance because of the price.

Dataroyal reconfigured its IPS-7 into the IPS-7000, which represents a 30% to 40% price reduction over the previous model, according to Huch.

Diablo showed its new 1660 terminal, which incorporates the firm's 200 char./sec matrix printer.

CCIA Sees Dangers In EFT Standards

(Continued from Page 49)

ganization to sponsor and administer the national and international voluntary standards activities in EFT.

"Standards activities in EFT under the sponsorship of such an organization would be implemented in a speedy fashion in all federal EFT systems, thus creating a framework for inducing local statewide EFT systems to follow suit," the CCIA stated.

There are definite indications that the future viability of EFT may be in jeopardy if the issue of standards is not resolved soon, it added. In order for the EFT system to be profitable, it must have high usage and be accessible to a variety of institutions and system users. EFT will not be economical if separate terminals are needed for different credit cards, it stated.

The CCIA testimony recommended the development of voluntary national and international standards should be the shared responsibility of both the private sector and the federal government.

Digital Cassettes are many and varied. Quality is important, but compatibility is just as important. High quality cassettes on the wrong units don't make for quality performance.

Syncom offers more machine compatible cassettes than any other supplier. For the right cassette, ask one of our "cats" in the field.

Disk Cartridges, Disk Packs, Data Modules, Computer Tape, Flexi-Discs, Digital Cassettes, MC/ST Magnetic Cards, Toners for Xerox & IBM Copiers.

Seeks Dominant Position

Cray Answering Scientific Arena's Cry for More Power

By Ann Dooley
Of the CW Staff

CHIPPEWA FALLS, Wis. — "We hold a dominant position in a narrow field and that's exactly where we want to be," according to Seymour Cray, president of Cray Research.

In the five years since Cray left Control Data Corp. to start his own company, he and his small staff have developed, manufactured and marketed the Cray-1, commonly referred to as a supercomputer.

The Cray-1 is intended to solve complex scientific problems. It has the ability to process vector operations as well as high-speed scalar processing ability, according to the firm. It was also designed to perform "chaining," which enables operations to be performed on several sets of data at the same time.

Seymour Cray

The company offers three versions of the computer: .25 million-, .5 million- and one million word (all with 64 bit/word) systems.

The Cray-1 consists of a mainframe and a Data General Corp. minicomputer console processor that doubles as a maintenance control unit.

It is considered an add-on computer rather than a replacement. It can be integrated into existing systems and further use of already functioning communication networks and peripherals, the firm said.

Leased Five Systems

In March 1976, the company went public and since then has leased five Cray-1 computers. The first went to the National Center for Atmospheric Research in May 1976.

Cray has also leased systems with 1-million word memories to the European Center for Medium Range Weather Forecasting, the Los Alamos Scientific Laboratory and two such machines to the Department of Defense (DOD).

All Cray-1s contracted for so far have been for the one million word capacity, but in the one-year interim it takes for delivery, companies are sent the first developed Cray-1, Serial No. 1, consisting of a .5 million word memory.

"We hope to keep farming out the Serial No. 1 until each one-million-word machine is ready," according to John Carlson, director of finance.

Although several years ago some observers claimed there was not a large enough market for the supercomputers to survive, both competition and market have opened up, he said.

Previously, only Texas Instruments, Inc.'s ASC and CDC's Cyber 76 and Star-100 were on the market, but now the Burroughs Corp. Illiac IV, the IBM 370/195, the Goodyear Aerospace Staran and potentially the IMS Associates' Hybercube systems are around.

"Burrough's entering the market also indicates to us there is definitely a market out there," Carlson pointed out.

"We also feel there is an expanding market for the large users," he said. "There is already a cry in the scientific community for more power, some are even asking for more than Cray-1."

"It's our goal to satisfy that demand," he added.

Cray has estimated there are about 100 governmental agencies, educational institutions and corporations worldwide that are potential users of the Cray-1. "Most of our clients are governmental, but we are also hitting areas where funds are currently being appropriated," Carlson said.

Last year's drought has made weather research and forecasting agencies look for faster turnaround time, he said. Nuclear and energy research are branching out and are becoming more critical issues and alternatives, Cray noted.

"Oil research will also be increasing in the next few years after the price controls have been lifted," he said.

Demand for More Power

"Our customers already have lots of power and they're demanding more," Cray said. With their expanded usage, they have few alternatives and, for the money, they will be needing the Cray-1, Carlson said.

"But we obviously must have a broader line than the Cray-1," Carlson said. Cray is in the process of researching a new product line which might or might not be called the Cray-2, Carlson said.

The Cray-1 would be the middle of the line with some machines being smaller, some larger. There would definitely be an advancement in speed as well, Carlson said.

"Initially we see most of our machines being leased with options to purchase," he said. But the DOD has a 60-month installment contract with options to revert to a lease, he added.

The one-million-word Cray-1 sells for $7,995,000 with an added error correction feature; it leases for a monthly fee of $210,500. The turnover rate for a large scale computer is judged to be about 10 years, Carlson noted.

CW Photos by A. Dooley

Gerald Simpson (left) and Jeff Bowen of Cray Research work on the Cray-1.

Real Advantage

"The real advantage to the Cray-1 is that it was developed later in time than the other large computers," Cray said. The others were built at least five years before the Cray-1.

"It's design takes advantage of those preceding it," he noted.

"I left CDC because I wanted to pursue more aggressively the kinds of computers I wanted to build," Cray explained. There are more constraints in a company the size of CDC than in a smaller one, he added.

"Now, I have more money to spend on what I want than I did when I was with them," Cray said.

Being located in a small town has never hurt the company, but the size does prohibit running the company from Chippewa Falls, Cray added. "So, we have sales and administration in Minneapolis and R&D and manufacturing in Chippewa," he said.

"I spend one-third of my time in Chippewa, one-third in Minneapolis and one-third on the road," Cray stated. "We give our professional people the choice of working out of Minneapolis or Chippewa Falls and we've never had a problem."

"I really think it's the best of both worlds; there are real advantages to living in a small town," Cray commented.

"We have defined for ourselves a more narrow market than a lot of the other companies and we've gotten 100% of that business," Cray said.

"Every procurement we've bid on, we've gotten, and it's done by being selective," he explained.

Orders & Installations

First Security Co., a tristate banking operation in Utah, Idaho and Wyoming, has ordered Bunker Ramo Corp. System 90 teller terminals and associated DP and communications equipment.

Princeton Applied Research has ordered IMP-16L/300 CPU application cards and IMP-16L/-006P random-access memory/-programmable-read-only memory (RAM/Prom) cards from the Microcomputer Systems Group of National Semiconductor Corp. for use in its medical electronics equipment.

BankAmerica Corp. has ordered a claims administration system from System Development Corp. to process employee health insurance claims.

The U.S. Army Computing System Support and Evaluation Agency has ordered a large-scale Control Data Corp. system centered around a Cyber 76 and a Cyber 173.

Computer Consulting Service, Inc. has ordered more than 100 Honeywell Level 6 Model 6/36 minicomputers valued at over $3 million.

PCA International, Inc., producer of color portraiture, has installed a Burroughs Corp. B1726 system.

The Eureka Co. has installed a Harris Corp. 8770 intelligent terminal system to handle accounting and inventory control at its Bloomington, Ill., headquarters.

The *Philadelphia Evening Bulletin* has ordered a TMS-1 text management system from Digital Equipment Corp.'s Graphic Arts Group.

Southern Bell Telephone and Telegraph Co. of Atlanta has ordered an additional 150 fast microfilm retrieval systems for directory assistance from Lockheed Electronics Co., Inc.

The City of Monroe, Mich, has installed a Burroughs Corp. B1726 system, which will process a variety of municipal applications, handle the city's general accounting functions and prepare special reports.

The Michigan Supreme Court has placed an order with Incoterm Corp. for intelligent terminals and services worth $300,000.

By Comparing Trade Statistics

Study Uncovers Worldwide DP Appetites

By Bohdan O. Szuprowicz
Special to Computerworld

If you ever have wondered why France is so determined to develop its own viable computer manufacturing industry, just look at the international trade statistics.

France is the largest importer of office machines, computers, calculators and associated equipment in the world. Out of a total of $9 billion worth of such equipment traded internationally in 1974, France imported almost $1 billion — over 11% of all such products exported by everybody all over the world

My firm, 21st Century Research, discovered this huge French appetite for imported foreign office equipment during an attempt at ranking all the countries in the world according to the amount of DP equipment imported every year. Our objective was to spot the best business opportunities in the rapidly growing computing equipment markets in the developing countries of Africa, Australasia, Latin America and the Middle East (see accompanying box).

This also explains why we used trade statistics for 1974 and why we compared the Standard International Trade Clasification (SITC) Code 714 figures, which include not only computers and peripherals but also statistical machines, calculators, typewriters and other accessories.

The reason is that, in many developing countries, trade data collection and publication lags two to three years behind the actual shipments and before they show up in the United Nations international trade statistics. Also, some countries report only at aggregate levels, such as Code 714, without going into details of what they are importing.

International News

But Code 714 is a good indicator of the markets we are looking at because, after all, IBM, which accounts for a predominant portion of this business, manufactures equipment in most Code 714 subcategories.

Looking at a total of 128 countries, we ranked 50 of the largest importers and also indicated their exports, if any, in this product category. Interestingly, 39 of the top importers are also exporting office machinery, although only nine export more than they import.

Not surprisingly, France is not among the latter few, but it still is the fifth largest exporter of such products in the world.

Perhaps even more interesting is the fact that the U.S. is also one of the top importers of office equipment in the world, accounting for over 10% of all the trade and holding the third place behind France and West Germany.

The U.S. is often believed to have a global monopoly of this market. However, although it is the largest exporter of office equipment in the world, it only accounts for ahout 30% of the total international trade.

Off-Shore Factor

Much of the exports from such countries as Germany, France, Sweden the UK and Japan are also IBM computers and peripherals manufactured in those countries. Other American firms, such as Burroughs, Honeywell, Control Data Corp. and Univac, also manufacture some of their equipment in foreign countries and export it to other world markets as well as to the U.S.

Nevertheless, whatever the product label on the equipment, it is the manufacturing country that derives the most benefits in form of employment, taxes, duties and markets for supplies of materials and services.

Because DP equipment manufacture is a labor-intensive industry, there is every reason to believe that proliferation of computer and minicomputer manufacturing firms will continue, particularly in less industrialized countries with large populations.

Countries with high import levels of office equipment products also have strong incentives to develop domestic products hecause they can reduce their often persistent trade deficits, develop their own technological base and even engage in exports of their equipment — not to mention expanding employment and training opportunities for part of their lahor force.

Looking down the list of the top 50 importers, Canada and Australia are clearly two immediate candidates for expanding their DP equipment manufacture. Even though both are developed countries, their imports are relatively large and substitution of domestic products could support a sizable manufacturing firm.

The Soviet Union, which imports as much as Australia, is not truly comparable because most of that market is prearranged by bilateral agreements between communist countries and because only a small percentage represents imports from the West. Nevertheless, the size of Soviet imports is a good reason why the Soviet Union wants to protect its huge computer market and develop its own industry to the point where it can also compete for other markets in the world.

But talking of communist countries, it is perhaps worth looking at the enviable position of East Germany, which is the seventh largest exporter of office equipment in the world and shipped over 10 times as much as it imported in 1974. Much of this trade at present is with the Soviet Union and East Europe, but some East German office equipment is already sold throughout the world.

Brazil, Spain and Mexico clearly have a lot to gain by getting into computer equipment manufacture in a big way. Most developing countries will of course continue to import some large and special systems forever. Increasingly, however, they will he manufacturing small machines, minicomputers and peripherals which are in demand within their own and neighboring countries.

Despite the benefits of ready-made equipment and IBM service, more countries will find they have many good reasons to make an effort to fight and switch.

Top 50 DP Import Markets

(In Millions of U.S. Dollars for 1974)

Rank	Country	SITC Trade Classification Code 714 Product Category Imports	Exports
1	France	971.0	843.9

IBM Makes No. 10 on Forbes List, No. 8 on Fortune

NEW YORK — The Forbes 500 listing of large industrials is perhaps less frequently referenced than the Fortune 500 list, but it is equally complete and, in addition, interesting because the two publications' rankings vary considerably in some instances.

Forbes, besides ranking companies by assets, sales and earnings, has also compiled a listing by the firms' chief executives' total remuneration.

For convenience and comparison, the Fortune 500 ranking for each firm [CW, May 16] has been included in parentheses.

Forbes ranked IBM tenth (8) in sales, down a notch from its No. 9 position last year. The giant was, however, first in market value, fourth (3) in earnings and 19 (5) in assets.

Sperry Rund dropped three spots in the Forbes ranking to 82 (62) despite a 5.3% gain over last year's sales.

Teledyne fell eight places to 113 (115) with a 6.8% growth in earnings while Honeywell plummeted from No. 35 to 124 (88) accompanied by a 9.6% decrease in sales compared with 1975.

NCR dropped back one place to 134 (96) while Control Data Corp. rolled back eight places to 160 (173). Burroughs, on the other hand, with an 11.6% gain in sales, rose six places to 171 (120) and Texas Instruments leaped 30 slots to 198 (133) with its 21.3% sales increase.

A 13.3% sales increase moved Hewlett-Packard up seven places to 390 (200) while a 37.9% increase put Digital Equipment Corp. back on the Forbes list at 436 (280). DEC did not make the top 500 last year.

Financial News

Finally, Lear Siegler dropped down eight places to No. 460 (292).

Executives' Remunerations

Harold Geneen, of International Telephone and Telegraph drew the fattest paycheck of any U.S. chief executive — $263,000. His total remuneration, which included salary, bonuses, director's fees and deferred compensation, totaled $990,000.

In the computer industry, IBM's Frank T. Cary drew the largest paycheck — $300,000 in salary and bonuses, with $595,830 total remunerations. Cary was, however, only the 28th highest paid U.S. executive out of a pool of 798.

Burroughs' Ray W. Macdonald ranked 36, with $525,000 in remuneration; Texas Instruments' Mark Shepherd Jr. ranked 87 with $441,409; TRW's Horace A. Shepard and Sperry Rand's J. Paul Lyet are 109 and 110 with $419,895 and $419,419 respectively.

Edson W. Spencer received $399,500 from Honeywell, making him the 124th highest paid executive, while NCR's William S. Anderson was 137th with remunerations of $290,000.

William C. Norris of CDC ranked 292 with $285,471; DEC's Kenneth H. Olsen ranked 364 with $163,750 and Data General's Edson deCastro ranked 792 with $75,000.

Acquisitions

A.C. Nielsen Co., international business services firm, has acquired **Coordinated Management Systems, Inc.**, which specializes in the development of computer-based interactive marketing information systems.

Automatic Data Processing, Inc. (ADP) has acquired **First Data Corp.** and filed an S-14 registration statement with the Securities and Exchange Commission in connection with the acquisition, covering 302,334 shares of ADP common stock.

Nixdorf Computer AG has acquired **Entrex, Inc.** for $22 million in cash.

Informatics, Inc. has acquired the **Direct Dial Data System** from Greyhound Computer Corp.

Sun Information Services has acquired **Applied Financial Systems, Inc.**, which specializes in providing DP to bank trust departments.

May and Speh Data Processing Center, a division of System Development Corp., has acquired the **Chicago Data Center** of Greyhound Computer Corp.

Memorex Corp. has acquired **CFI Memories, Inc.** and its parent company, **Lencor International**. Terms of the sale call for payment of $2.4 million in cash and 200,000 shares of Memorex stock to Lencor stockholders.

Sycor, Inc. has terminated previously announced discussions aimed at purchasing an interest in three European computer companies, CMC France SA, Computer Machinery Deutschland GmbH and a minority share of Computer Machinery Co. of England.

New Registrations

SCIENCE APPLICATIONS, INC., 1200 Prospect St., La Jolla, Calif. 92037, a scientific applications computer firm, filed to register 72,500 shares of common to be offered by certain selling shareholders to employees and consultants of the company. No underwriter is involved.

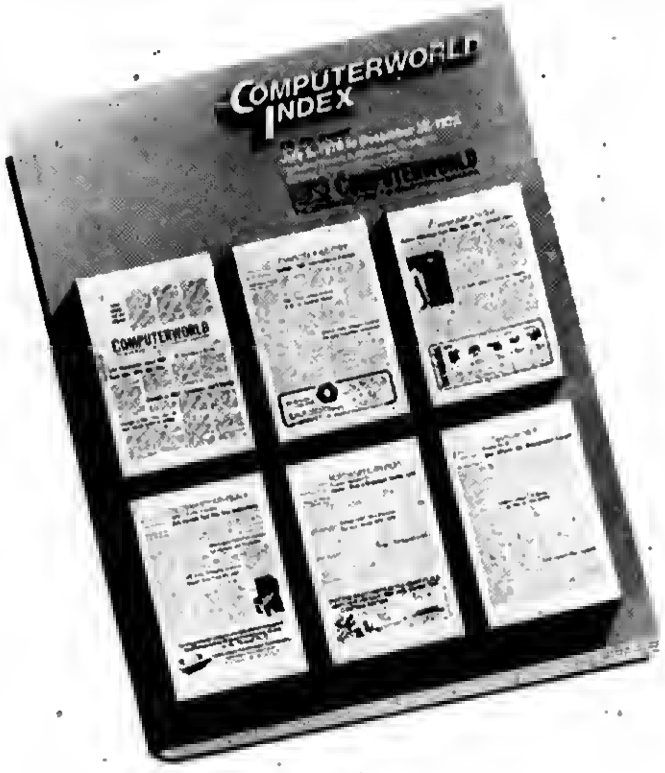
EG&G, INC., 45 Williams St., Wellesley, Mass., a scientific and technically oriented computer firm, filed to register 387,513 shares of common issued in connection with the acquisition by EG&G of Reticon Corp. on Dec. 28, 1976. The selling stockholders have advised EG&G they propose to sell, from time to time, all or part of the shares offered by them in private principal transactions and through brokers.

HONEYWELL, INC., Honeywell Plaza, Minneapolis, Minn. 55408, filed to register 1.4 million shares of common which may be sold from time to time, at prices and at terms then obtainable, on the New York Stock Exchange or other security exchanges, in the over-the-counter market in negotiated transactions or otherwise by or for the account of General Electric.

EG&G, INC., 45 Williams St., Wellesley, Mass., a scientific computer firm, filed to register 549,473 shares of common to be offered in exchange for the outstanding common stock of Princeton Applied Research Corp., Princeton, N.J., at the rate of .587 EG&G share for each Princeton share. No underwriters are involved.

AUTOMATIC DATA PROCESSING, INC. (ADP), 405 Route 3, Clifton, N.J. 07015, a computer service firm, filed to register up to 302,345 shares of common. It is proposed to offer these shares in connection with the acquisition of First Data Corp. through the merger of a wholly owned subsidiary of ADP with and into First Data. Upon the merger, each outstanding share of First Data common stock will be converted into .4529 ADP share and each outstanding share of First Data preferred will be converted into 22.645 ADP shares. No underwriter is involved.

DATA 100 CORP., 6110 Blue Circle Drive, Minnetonka, Minn. 55343, a remote data processing firm, filed to register $10 million of convertible subordinated debentures due 1992. They will be offered by the company through underwriters headed by Dean Witter & Co., Inc., 33 N. Dearborn St., Chicago, Ill. 60602.



SUBSCRIBE TO THE 1977 COMPUTERWORLD INDEX AND GET SIX MONTHS OF REFERENCE INFORMATION FREE.

The new Computerworld Index, published quarterly and cumulative, is an invaluable reference tool for organizations that have a need-to-know about what's going on in the computer world.

The first issue of the Index for example, covers the last six months of 1976, and it includes more than 4,000 entries by subject, author and name of any company mentioned. It breaks topics down into highly usable and convenient categories:

- There are entries by *product or service*, like *PRINTERS*, which has 37 entries in the six-month period covered; or *LEASING*, which has 10.
- There are entries by *industry*, like *INSURANCE*, under which there are 17 entries for various stories on the use of computers in the insurance industry.
- *Types of computer applications* is another way you can look something up in The Index. The category *INVENTORY SYSTEMS*, for example, has 21 entries.
- *Regulatory*, *security* and *social issues* are also indexed. There are 34 entries under *PRIVACY*, 10 under *PRIVACY ACT* and 9 under *PRIVACY PROTECTION COMMISSION*, for example.
- The Index also makes it easy to look into *legal aspects of computer use* with categories like *LITIGATION*, which has 24 entries in the last six months of 1976.
- Even *foreign countries* are indexed. The category *JAPAN*, for example, has 9 entries.
- . . . and there are *others*: *KIT COMPUTERS* (the kind you build yourself) are the latest thing, and The Index shows 5 entries. *POINT-OF-SALE SYSTEMS* has 14 entries . . . and there's much, much more.

Company Names, for example, are a very important part of The Index. Looking under IBM, we find *ten* categories:

- IBM GENERAL
- IBM LITIGATION
- IBM SOFTWARE
- IBM SYSTEM 3
- IBM SYSTEM 7
- IBM HARDWARE
- IBM PRICING
- IBM POLICY
- IBM SERIES 1
- IBM SYSTEM 32

Our special, no-risk offer:

Subscribe to one year of the Computerworld Index (4 quarterly issues, published three months after each quarter ends and cumulative) at the regular rate of $150; and we'll send you the Index for the last six months of 1976 FREE. In addition, we'll give you ten days to look over the 1976 Index AT NO OBLIGATION. Should you decide it's not what you need, just return it to us marked "cancel" and we'll cancel your subscription.

Manager
Data Processing
Lawyers' Title Services, Inc.
P.O. Box 3588
Orlando, Fla. 32802

Data Processing Instructor

Full-time nine-month position beginning September, 1977. Involves instruction in all areas of computer programming, systems analysis, and computer math. Bachelor's degree in computer science/data processing and experience in computer programming, operations and major languages required. Master's degree and one to three years teaching experience at two-year college level are desirable. Salary: $10,000 to $13,000. Send letter of application, resume, and three letters of reference to: Dean of Instruction, Marion Technical College, 1465 Mt. Vernon Ave., Marion, Ohio 43302. An equal opportunity/affirmative action employer.

Systems & Programming Professionals

HAVE THE BEST OF BOTH WORLDS! Join our sophisticated IBM 370 - teleprocessing IMS VS installation. Reap the benefits of outstanding hardware and software while taking advantage of individualized technical training on a planned basis.

Our data processing function (70 people) is embarking on major systems development activities therefore, we are recruiting:

*SYSTEMS ANALYSTS with several years of experience utilizing latest state of the art techniques in systems design and implementation.

*PROGRAMMERS with several years of responsible COBOL or ASSEMBLER language programming experience.

Because of our staff size, you will find yourself involved in major developmental projects using the latest data base technologies and working for an organization geared to your career development. Qualified applicants are encouraged to submit resume, including salary history, in confidence to:

COMPUTER

Telefile makes computers work better and faster. Our company, a leader in the unlimited world of computer enhancement, has the rare opportunity for:

- **•Diagnostic programmer with a minimum of 2 years experience in communications and assembly level programming.**
- **•Technician hardware checkout, P. C. Board and documentation experience required.**
- **•Draftsperson at least 3 years P. C. Board, layout/tape-up, logic diagram or assembly background necessary.**

Telefile is the right company at the right time and the right place for the exceptional applicant.

If the challenge of success is your goal, send your resume in complete confidence to:

D. E. White
Vice-President of Engineering
Telefile Computer Corporation
17131 Delmter Street,
Irvine, CA 92714
Equal Opportunity Employer M/F

DATA PROCESSING PROFESSIONALS

With offices and openings in Chicago, Milwaukee, and Houston, SPR is actively seeking professional technical representatives to augment its rapidly expanding staff.

Through our incredible performance record, SPR has emerged as a leading provider of human resources to the data processing community.

Several positions are available in all 3 SPR locations:

* PROGRAMMERS
- 3 to 5 years experience with either COBOL or BAL

* PROGRAMMER/ANALYST
- with CICS or IMS experience

* SR. PROGRAMMER ANALYSTS
- Data Base of Telecommunications experience

SPR has firmly established a people-oriented reputation, as evidenced by a mere 5% technical personnel turnover rate. Systems and Programming Resources:

- **Pays for Overtime**
- **Has Paid Vacation and Holidays**
- **Provides Comprehensive Life/Health/Disability Insurance**
- **Pays for Travel and Other Business Related Expenses**
- **Provides State-of-the-Art Education**
- **Pays Performance Bonuses**
- **Provides a Liberal Moving and Relocation Allowance**

If your career has been dead-ended, or if your expectations haven't quite been met, SPA may be the answer. If challenging and diversified project assignments appeal to you, join a WINNER - join SPR.

Call (312) 654-4188, or send a resume in confidence to:

SPR

Amdahl interviewing in Poughkeepsie, Long Island, Boston, Minneapolis and Washington D.C.

Amdahl Corporation, manufacturer of the well-received 470V/6 computer system, has met the challenge of designing and building a new generation of large computers. Although the past year has seen us grow, there's still room on the ground floor for individuals who seek a challenging and friendly environment. Our benefits package is excellent and you'll be well-compensated for your efforts. Following are some of our more immediate needs. If you're a qualified candidate, perhaps the opportunity you desire is here... at Amdahl.

DIAGNOSTIC ENGINEERS

High level languages, logic design. Design and develop advanced diagnostics.

DESIGN AUTOMATION ENGINEERS

Language design, data base, design verification, test generation, physical packaging, routing.

DIAGNOSTICS QA ENGINEERS

Software QA, high level and assembly language, logic design and computer organization.

SOFTWARE ENGINEERS

Mini-computer real time O/S, multiprocessing and large systems. Or configuration management in code control or file control systems.

Amdahl engineers will interview in Poughkeepsie and Long Island on Sunday, July 17 and Monday, July 18, and in Boston, Minneapolis and Washington D.C. on Sunday, July 24 and Monday, July 25.

Qualified professionals are invited to schedule an interview. Send your resume to Chacko Neroth, Amdahl Corporation, 1250 East Arques Avenue, P. O. Box 5070, Sunnyvale, California 94086. We are, of course, an equal opportunity employer.

SOFTWARE SPECIALISTS

Boeing Computer Services, Inc., in Seattle, Washington is seeking experienced computer professionals for important assignments in the following areas:

COMMAND AND CONTROL/REALTIME SYSTEMS

- Design, development and test of Realtime software for command and control weapons systems, communications systems and ground support.
- Development of simulation and training software for Realtime surveillance systems.

COMPUTING METHODS AND TECHNOLOGY/SYSTEM DESIGN AND ANALYSIS

- Design, development, programming and formal documentation of the Realtime executive component of a large, complex command and control system.

DATA ANALYSIS SYSTEMS

- Development of interactive graphics software using a TEKTRONIX 4051 interfacing with a CDC 6600.

SOFTWARE TEST AND VERIFICATION

- Development, verification, qualification and formal documentation of software test requirements and procedures.

MINI-COMPUTER SYSTEMS SPECIALISTS

- Mini-computer application analysis, system design and software analysis for data reduction/acquisition, data entry, data base management and output processing.
- Design DC mini-business and scientific systems. Experience with Realtime mini-computer simulation of missile flight dynamics and analysis of radar data and message switching.
- Development, maintenance and preparation of comparative analyses of mini-computer software and operating systems.

OPERATING SYSTEM PROGRAMMERS

- Maintain NOS 1.0 or KRONOS 2.1 operating systems.
- Requires in-depth knowledge of CDC 6600, CYBER 70 and 170 hardware.

COMPUTER AIDED DESIGN/MANUFACTURING

- N/C Systems Analysts and Programmers to integrate the APT system with Process Control Computer Systems.
- Systems Analysts for design and maintenance of N/C distributed system software.
- CAD/CAM Software Designers to design and implement software to integrate CAD/CAM interactive mini-computer graphics systems with large scale computers.

DATA BASE DESIGNERS/ANALYSTS

- To design, develop and implement physical and logical data base applications using IMS, IDMS, System 2000, CICS, or distributed processing.

DATA PROCESSING INSTRUCTORS

- Requires experience in Structured Programming/Design or IMS.
- Instructor experience desired.

Attractive salary, fringe benefits and moving allowances will be offered qualified candidates. And living is a pleasure in the unspoiled Northwest with its many recreational and sports activities and relaxed life-styles.

Look into these outstanding opportunities.

Send your detailed résumé to The Boeing Company, P.O. Box 3707-JHU, Seattle, WA 98124.

An equal opportunity employer.

BCS BOEING COMPUTER SERVICES, INC.

FLORIDA INTERNATIONAL UNIVERSITY

Director
University Computer Center

Florida International University at Miami is an urban, upper division, multi-campus university, serving 2.6 million residents of Southeast Florida. The computer center is part of a growing statewide computer network and supports a large number of computer-intensive academic programs, extensive administrative applications, and a growing research activity. Hardware and operating systems support is provided via the Southeast Regional Data Center and by the Northwest Regional Data Center with Univac 1108 and IBM 360 equipment respectively.

Requirements: Bachelor's degree in accounting, management, computer science, mathematics, industrial management, or other closely-related fields with extensive training in computer concepts; seven years experience in electronic D.P. work or any equivalent combination of experience and training in all phases of computer facility operations. This management position requires extensive managerial and supervisory experience with heavy emphasis on systems analysis and programming, preferably in an educational environment. Salary low to mid-twenties based upon credentials and experience. A letter of application and resume should be submitted no later than July 29th. Direct materials to the chairperson, Search & Screen committee for Director of Computer Center, Florida International University, PC 510, Tamiami Trail, Miami, Florida 33199.

Criminal Justice experience is preferred. Annual salary: Start $15,670, advanced to $23,400 with longevity and merit. Civil Service benefits. Apply with: Hillsborough County Civil Service, P.O. Box 1110, Room 273, County Courthouse, Tampa, Florida 33601. An EOE.

SALES
a Star is Born

Computer Sales Professionals are invited to unveil a new career with the Sperry Univac BC/7 Business Computer

The Sperry Univac BC/7 is a brand new, inexpensive, easy to use business computer for the application systems solution marketplace that provides the power of a large scale operating system. It's been just 4 months since the introduction of this fantastic product and already, the business community has responded with unprecedented demand for purchases, demonstrations and further information. We attribute this "boom" to our marketing strategy involving ● top dollar advertising ● direct mail campaigns ● seminars ● the Sperry Univac image ● a hustling, well-informed, well-trained sales force. Putting it mildly, our sales team is getting their fair share...why not get yours?

In order for the BC/7 to achieve the stardom that is its destiny, we're focusing the spotlight on successful computer professionals like yourself.

To qualify for a spot on the BC/7 marketing team, you'll need a proven track record as a successful, ambitious, hard working, strong closing computer sales professional. Managerial potential would be a definite plus, because you'll be given every opportunity to advance toward that direction if you so desire.

As far as compensation is concerned, our program is the envy of the industry. It consists of salary + commission + expenses + benefits. Our people do well here, and so will you.

You may never again be faced with an opportunity to assume an exciting new role that combines the dynamics and growth potential of a new venture with the solidarity of an established industry giant.

Openings in 20 Major Cities with Districts soon to be open in:

Buffalo Charlotte Columbia, Md. Hartford
Long Island Milwaukee Seattle

If you're interested in us and you meet our requirements, we're interested in you. You may contact our representative by calling 1-800-821-7700, ext. 307 toll free ALL DAY SUNDAY, MONDAY-FRIDAY, 9am-5pm. Or you may prefer to send your resume or letter of interest to Mr. Juris C. Peice, Manager Employee Relations, Sperry Univac, Business Systems Marketing, P.O. Box 500, Bluebell, Pa. 19422.

F. P. Healy & Co., Inc.
Management Consultants
630 Third Ave., N.Y., N.Y. 10017

CONSULTANT, COME HOME!
Corporate Controller

We're looking for a CPA and/or MBA who's looking for a home. You're probably the number two man in your organization right now. Or maybe you're in the top position, but you're lacking a challenge and a future. In any event, we're offering an exciting career opportunity.

We are a large sales organization, located in an attractive upper-Midwest suburb. We need someone to direct all our financial activities and manage our accounting staff. You must be systems oriented and have a history of innovative problem solving. You'll also control all of our computer operations, including integration of a brand new system.

More than anything else, you'll be involved in a fast paced organization, making decisions and taking full responsibility for those decisions. You'll find this an unusually interesting opportunity, with a compensation package designed to attract a top level professional.

Our needs are immediate, so send your detailed resume in strictest confidence to:

CW Box 5104
797 Washington St.
Newton, Mass. 02160

DIRECTOR OF INFORMATION SYSTEMS

We have an opportunity and a challenge for a manager to direct the growth of a department to a level of 15 to 20 people. We are completing a 5 year plan for an integrated information system and expect to choose soon new and larger computer equipment.

We prefer a business manager with an MBA degree. Information systems experience and a manufacturing orientation are important. Past participation in the advancement of a computer department will be a consideration.

The salary depends on you; a starting level in the mid $20's is expected.

Ours is a medium-sized, growing manufacturing business based in Central Ohio, with 6 product lines, 5 plants, and national and international markets.

Please send your detailed resume to

MAKE THE RIGHT MOVE

You're time is now. You've paid your dues and you're ready for the next step. You can be sure that step is in the right direction with Teledyne Brown Engineering. A well established company in Huntsville, Alabama, Teledyne Brown has several openings for experienced data processing professionals.

PROGRAMMERS

You'll be developing simulation, data reduction, and test control software on large mainframes and minicomputers. A B.S. in Computer Science, Physics, or Engineering and at least five years of programing experience including work in assembly language are prerequisites for success.

TEST PLANNERS AND DATA ANALYSTS

As testors, you'll plan software tests and analyze resulting test data. A B.S. in Computer Science, Physics, or Engineering and a minimum of three years experience in testing large real-time software packages are musts.

SYSTEMS ANALYSTS

You'll be analyzing hardware architecture and systems performance, writing high level requirement/specifications, and projecting future technology requirements. A minimum of three years in designing processing algorithms and developing or analyzing processor system requirements and technology trends are critical. BS Computer Science, Physics, or Engineering required.

SYSTEMS SOFTWARE DESIGNERS

This is your chance to enter the stimulating world of computer graphics. Your work will include writing specs, designing, and developing interactive graphics on a mini. You'll also develop a high level simulation language compiler. A BS in Computer Science or Engineering and three years in systems software should back up your creative instincts.

DP METHODOLOGY DESIGNERS

If you have a knack for software efficiency, this is the spot. As our resident methodology expert, we'll be looking to you for strategies that optimize data processor designs and reduce related time and costs. Primary concentration will be on partitioning techniques for distributed systems, approaches to incremental development, specification languages, coding practices, Science, Physics, or Electrical Engineering, coupled with experience in data processor and software engineering research, we'd like to discuss these opportunities.

Please submit your resume and recent salary history for immediate consideration to:

COMPUTER PROFESSIONALS

The J. Preston Levis Regional Computer Center (JPLRCC) provides computing services for a number of users in northwest Ohio, including Bowling Green State University, the City of Toledo, the University of Toledo, and the Toledo/Lucas County Criminal Justice Regional Planning Unit. Batch, timesharing and real-time services are offered on an IBM 360/75 and a Univac 1110 2x1. JPLRCC is located south of Toledo in surburban Perrysburg, in an area with a full range of cultural and recreational opportunities, and has the following openings:

DIRECTOR OF USER SERVICES

This position reports to the Executive Director and is responsible for all relationships with users, both through large user organizations and directly with end users. The staff which this position manages performs user consulting; applications systems design and programming; documentation and Newsletter preparation and distribution; user education; and library support. The successful applicant will have a Master's degree in a field related to computing or an equivalent combination of education and experience; at least five years of total experience in computing; have managed a group in the computing field; and have broad experience in all aspects of computing, particularly in a networking environment. Starting salary will be in the $20,000 - $25,000 range, depending on qualifications.

SENIOR SYSTEMS PROGRAMMERS (2)

Responsibilities will include systems programming support of Univac 1100 and/or IBM OS. Experience with both systems is highly desirable, but not necessary. The successful applicant will have at least 2 to 3 years experience in systems programming on EXEC-8 (1100-OS) or IBM OS or VS and be familiar with the respective SYSGEN process, and a bachelors degree or equivalent combination of education and experience. A proven ability to lead others as a project manager is also highly desirable. Starting salary will be in the $16,000-$20,000 range, depending on qualifications.

SYSTEMS PROGRAMMER

This position requires a versatile person who can handle projects on both the Univac and IBM systems. Knowledge of IBM JCL or Univac ECL, COBOL and FORTRAN, and an assembly language are necessary. The successful applicant will have 1-3 years of systems programming experience on either system, and a bachelors degree or an equivalent combination of education and experience. Starting salary will be in the $13,000 - $17,000 range, depending on qualifications.

In addition to the indicated salaries, a full fringe-benefit package applies, including 4 weeks of vacation and tuition-free continuing education. Applicants should submit a complete resume, salary history and a list of references no later than August 1, 1977 to: Personnel Officer, JPLRCC, 25875 Dixie Hwy., Perrysburg, Ohio 43551. (JPLRCC is an EO/AA Employer)

SALES ENGINEERS & FIELD ANALYSTS

Varian Data Machines joins Sperry Univac...

with the full intention of becoming THE major force in the minicomputer industry. To accomplish this wee need the best professionals available in the marketplace today. So, if you're a professional of demonstrated ability, you belong with the company that can give you not only one of the best compensation packages available but also the prestige, growth opportunities and career satisfaction that can only come from a $1-1/2 billion corporation . . . Sperry Univac.

SALES ENGINEERS

We have openings for Sales Engineers with 3 to 5 years technical sales eperience in the minicomputer systems market. Our products include real-time, data communications and distributed processing systems. The positions require a technical degree or equivalent experience and selected candidates will be responsible for developing and maintaining real-time commercial accounts.

FIELD SYSTEMS ANALYSTS

Opportunities exist for Field Systems Analysts with an appropriate technical college degree and a minimum of 3 years pre sales and/or analyst support experience for real time commercial (Data Base, Data Communications, Distributed Processing) and/or real-time scientific applications. Our Field Analysts work closely with Sperry Univac Sales Engineers in a pre-sales environment, with specific emphasis on real-time scientific and commercial applications, and provide the key sales and headquarters interface role in proposal preparation, as well as in defining solutions to specific needs of potential and present customers.

For openings in Los Angeles, San Diego and Phoenix please call: 714/897-9515 or 213/598-4438.

For openings in San Francisco, Denver and Seattle please call: 408/736-5630.

For openings in Dallas, Houston and Orlando please call: 214/231-5145.

For openings in Chicago, Detroit and St. Louis please call 312/692-7184.

For openings in Boston and Rochester please call 617/890-6072.

For openings in New Jersey, Manhattan and Philadelphia please call 201/569-2323.

For openings in Cleveland, Dayton, Cincinnati, Pittsburgh and Washington, D.C. please call 301/773-6770.

Collect calls will be accepted.

Resumes may be directed to Art Ruben.

A Very Good Year for Us. A Better One for You?

Most computer professionals are aware that today's most advanced large-system technology was developed by a company that, not too long ago, was virtually unknown.

Now the phenomenon is widely known. Amdahl's 470V/6 performs as promised. And the company performs as promised: our hardware and software support exceeds the established standards.

Not well known, however, is that this major supplier of large systems is still, in terms of staff size, relatively small. At Amdahl, you're not lost in a sea of people: we began 1976 with less than 400 people and ended it with less than 800. There's still room on the ground floor.

We're looking for above-average talent. You can expect an above-average compensation and benefits package. Please direct your response to Employment Manager, Amdahl Corporation, 1250 East Arques Avenue, Sunnyvale, CA 94086. We are, of course, an equal opportunity employer.

Immediate openings throughout the U.S. and Canada. Field candidates will undergo a training period in California on full salary with housing, transportation, and other expenses provided.

FIELD ENGINEERING SPECIALISTS

You will have a minimum of 5 years' experience in maintaining large-scale systems with in-depth training on compatible CPUs. You will have company support in assisting the Amdahl customer in his mixed-vendor environment to maintain full operations in his center. Openings in several major cities and at Amdahl headquarters in California. Please indicate 560-E on your response.

FIELD ENGINEERS

You will carry the Amdahl philosophy of customer service as well as your expertise into the field, utilizing your initiative and talents to aid the customer in restoring computer center operations regardless of the origin of the failure. Large system experience essential, preferably on compatible equipment. Please indicate 567-3E on your response and direct it to the Amdahl regional office nearest you as shown below.

ACCOUNTING SOFTWARE FOR DEC RSTS/E CTS-500 USERS

From one of the pioneers in commercial data processing using RSTS. Successful installations in manufacturing, distribution, service bureau uses. Completely on-line, interactive systems. If you are installing or have installed a RSTS/E or CTS-500 system, contact us first for cost-effective solutions in: **ACCOUNTS PAYABLE; GENERAL LEDGER; FINANCIAL REPORTING**

The design specifications for these packages were developed by accountants for use by accountants. All packages provide excellent audit-trail, extensive user prompting, fast data entry, full file maintenance and inquiry capabilities, modular design and construction.
These are consolidating packages and support multi-division company and multi-company corporate accounting functions.
For more information, contact us at:

Q.

Where do I turn
for the best software
packages available?

Personnel Management and Reporting

MSA'S Personnel Management and Reporting System keeps records on more people than live in Atlanta, San Diego, Boston and Los Angeles combined.

If you'd like to find out how this system can help you keep comprehensive personnel data in compliance with Federal Governmental EEO, ERISA and OSHA requirements, call Marge Kimbrough at (404) 262-2376 or send us this coupon.

Caution: CRTs May Be Eye Hazard

By John P. Hebert
Of the CW Staff

There are thousands of people currently using display terminals in this country. Some of them may unavoidably fall asleep doing their jobs – and not because they had one too many the night before.

Eyestrain is the culprit, according to Dr. Jeryl Sparks, a Dallas optometrist who said his office is frequented by Texas Instruments, Inc. and Collins Radio Co. employees who use CRT terminals in their jobs each day.

Although the problems of a loss in visual clarity and soreness and swelling of the eyes are shared by people in any job requiring "detail" work, a few could be caused by the terminals or the places in which they are found, according to Sparks.

His observations are supported by a study of CRT operators in Europe published by Air France.

As of December 1976, there were 58,000 conversational CRT terminals and 294,500 editing CRTs in use in this country, according to figures published by International Data Corp. in a recent study on data entry and data communications equipment.

These figures are probably slightly higher now, according to a spokesman for the market research firm. It is unknown, however, how many CRT users actually suffer eye problems.

The elements contributing to eye discomfort could range from the brightly lit air-conditioned offices where the terminals are located to glare from the devices' reflective faceplate and the dot-matrix characters displayed on the screens.

President Carter, flanked by privacy commissioners, reaches for report.

Carter Pledges Influence To Develop Privacy Policy

By Edith Holmes
Of the CW Staff

WASHINGTON, D.C. – President Carter pledged last week to use his "Influence as President" to help develop a national policy governing the treatment of personal records in public and private data banks.

The pledge was made at a meeting in the White House Cabinet Room last Tuesday morning with David F. Linowes, chairman of the Privacy Protection Study Commission, and members of his staff. At that meeting, the fruits of the commission's two years of work were formally presented.

Carter agreed to discuss the study with his Cabinet members at a meeting today and ask them to read the commission's 638-page report.

And on Capitol Hill reaction to the report was swift. As many as 11 separate bills were offered to help turn the commission's recommendations into reality.

The Privacy Protection Study Commission was established by the Privacy Act of 1974 to study whether the business community should be required to protect the confidentiality of records they maintain on individuals.

At a joint hearing of the Senate Committee on Governmental Affairs and the House Government Operations Committee's Subcommittee on Government Information and Individual Rights, Rep. Barry M. Goldwater Jr. (R-Calif.) and Rep. Edward I. Koch (D-N.Y.) – both commission members – gave "legislative expression" to the privacy group's recommendations.

This took the form of 10 separate bills that Goldwater said he hoped will "ultimately be incorporated into the Omnibus Privacy Act of 1977."

The bills, designed to provide privacy guidance for the private sector and to clarify the government's role in assuring that privacy, deal with consumer and commercial credit, banking, insurance and medical records, the Social Security num-

Firmware Lets Mini Emulate IBM 370

RANDALLSTOWN, Md. – Interdata 7/32 minicomputers can now be outfitted with firmware that allows them to emulate IBM 370 mainframes, according to the developers of the firmware, Kardios Systems Corp.

With the enhancement, the Interdata system can run any of the IBM 370's applications programs, according to the Kardios spokesman.

The company is making the firmware available to present 7/32 users or will offer its own version of a configured 7/32, the Duo 70, complete with the firmware enhancement.

When outfitted with the enhancement, the system can run both Interdata applications programs under the Interdata instruction set and IBM application programs under the IBM instruction sets, the spokesman explained. The firmware can include a Basic Assembly Language (BAL) instruction set, commercial instruction set and a scientific instruction set.

Upgrading from the Interdata 7/32 to the Duo 70 takes about a day, the company noted, and Interdata will maintain the system with the enhancement.

In a job stream, the system will switch back and forth from applications written under Interdata to those written under IBM. The firmware runs under Interdata's OS/32 MT multitasking operating system, in two distinct operating modes, the spokesman added.

The Duo 70 costs $15,000 plus the cost of an Interdata 7/32 system configuration for the enhancement including the BAL instruction set. The commercial instruction sets and scientific sets have not yet been priced, a spokesman noted, but delivery can be 60 days after receipt of order. Kardios Systems Corp. is at 3820 Courtleigh Drive, Randallstown, Md. 21133

New Yorkers' Systems Hit Hard By Mid-Week Lightning Storm

NEW YORK – Computer systems were hit hard here last week when a lightning bolt knocked out a Consolidated Edison power substation, shutting down the utility's service to 2.7 million customers.

More than 3,300 computer centers were in the affected area, but at press time it was difficult to determine how many had been operating when the power went off at 9:33 p.m. on Wednesday.

But the reliance of business and industry on computer systems and the impact of such systems on the public was evident in the crisis.

With the shutdown last week, for example, all types of reservation systems – from airlines to hotels – were crippled, stranding travelers with and without reservations.

At both the Holiday Inn and the Sheraton Hotels the personnel could not make reservations – or confirm those already made – even at hotels in New Jersey, which was not affected by the outage.

All of those hotels' reservation systems operate through switches in New York and with switches down, reservations were

IBM Break-Up Seen as Only Solution

By Catherine Arnst
Of the CW Staff

NEW YORK – The only way to remove IBM's monopoly power over the computer industry is through divestiture, according to Dr. Alan K. McAdams, chief economic adviser to the Justice Department's trial team in the U.S. vs. IBM antitrust suit.

That is precisely the remedy the Justice Department plans to recommend if it wins the suit, according to Justice Department attorney Lewis Bernstein.

Without divestiture, there is very little that can be done to prevent further anticompetitive practices by the firm, McAdams testisfied at the trial recently.

"No institution is capable of monitoring IBM" in a manner that would allow competition to grow because of the complexity of the industry and IBM's ability to take disadvantages and change them into advantages, he added.

"I see no threat to IBM's monopoly position at this time [from existing competitors] . . . In order to affect behavior which limits competition you must remove the power that IBM has . . . The only mechanism capable of achieving that is to go to the heart of IBM's power – the general-purpose computer systems market," McAdams said.

IBM has been able to maintain its monopoly power because it dominates both the general systems and the plug-compatible peripherals market, the Cornell University economics professor explained. IBM was able to offset losses in one market by raising prices in the other and "the user received no benefits from such market control," he said.

Fixed-Term Lease Plan

Examples he gave included IBM's Fixed-Term Lease Plan (FTP) instituted in May 1971. The FTP offered low rental prices to users who signed on for long-term leases, but it penalized those who cancelled before the lease termination date.

The IBM task force that recommended the FTP forecast it would cause a revenue reduction of more than $75 million in 1971 to 1972. In order to recoup its losses, IBM announced price increases on CPUs and other portions of the system not covered by the FTP in July 1971 (which didn't go into effect until July 1972 because of the price freeze at that time), the prosecution's pretrial brief stated.

A 'Wash'

In August 1971, IBM predicted that "the net effect of the FTP and (CPU) price changes will be a wash insofar as business volumes are concerned," an internal IBM document said.

IBM could also change the interface design of its CPU to undermine competition in the peripherals market – another example McAdams gave of the firm's ability to dominate one market through its dominance of another.

This was a favorite strategy with the 370 systems line, all the components of which IBM originally intended to be fully interchangeable, McAdams testified.

The result of the several changes was "a great proliferation of interfaces" with accompanying inventory control problems for IBM and an undoing of the benefits interchangeability offered users, he said.

Interlocking Strategies

The FTP and the interface changes are two of the interlocking strategies IBM orchestrated to erect barriers to entry into both the general-purpose and the peripherals markets, McAdams said.

He illustrated the effectiveness of these barriers with a case study of General Electric's (GE) attempts to enter the general systems market. A test of whether a market is truly competitive is the ease of both entry and exit, McAdams said.

GE decided to enter the systems market in the late 1950s, and a feasibility study predicted its first break-even year would be 1976, McAdams said. Before it reached that point, howver, the study determined the firm could expect to incur before-tax losses of $250 million.

The only type of company which could sustain such losses is one that operates in several markets, as GE does, McAdams said. Consequently, the firm, which ranked ninth in the Fortune 500 list, was willing to go head-to-head with IBM on a systems basis, he testified.

GE and IBM development activities paralleled each other, McAdams said. Both attempted to develop a comprehensive time-sharing system data base management system. Both had the same degree of difficulty achieving those goals.

The difference was that IBM showed substantial profits while GE suffered substantial losses.

IBM could use its dominance in the peripherals market to offset its losses in the systems area and was able to "outpromise" GE; when both parties failed, the advantage reverted to IBM, he concluded.

When GE quit the business the user and the industry lost a highly innovative firm that was willing to take risks in its development efforts, McAdams said.

IBM Memo: 'A Smoking Gun'?

By Catherine Arnst
Of the CW Staff

NEW YORK – A 1968 memo indicating IBM was aware actions it was taking could be regarded as anticompetitive was introduced here recently in the government's antitrust case against the firm.

The memorandum, which IBM considered "privileged" and fought to keep out the case for nearly two years, concerned its introduction of the 370/155 – a system the government contends IBM announced to contain any threat a Memorex computer system might possess.

Described as a "smoking gun" by several members of the Justice Department team, the document is one of 14,000 ruled not warranting privilege claims.

The two-paragraph internal memo from the general counsel of IBM's Data Processing Group to the assistant general manager and senior vice-president of that group, dated Sept. 23, 1968, states: "If the [370/155] announcement is in any way accelerated, it is vitally important that no anticompetitive motive be spread in the files.

"I have alerted Mr. Wunderli, Systems Development Division counsel, to handle this with Mr. Branscomb, but it is of even greater significance that our files be clean."

At the top of the memo is the legend: "privileged communication – to be kept in a segregated file and not to be summarized or reproduced without permission of the law department."

According to testimony by Dr. Alan K. McAdams, the prosecution's head economic advisor, the memo offers one hypothesis of why no IBM analyses of Memorex's general-purpose computer system were available to the government.

IBM had conducted extensive studies of Memorex's entrance into the plug-compatible peripherals market with disk drives that were widely accepted and considered generally superior to IBM products, McAdams testified. This, he indicated, was based on IBM documents previously available to the government, and "I was very surprised no such analyses relating to the Memorex computer system were found," McAdams said.

Memorex's entry into the general-purpose computer systems market "would have been taken very seriously by IBM," making it even more unusual that no analyses of that aspect of a potential competitor's business was found, he added.

CAVEAT

If you're about to become the *Emptor* of a sort product, benchmark it first!

(It's the best "warranty" you'll ever get.)

Call (201) 568-9700

Make a date with a free six-step sorting survey.

Datapro, we love you! We think that piece you published on "How to Buy Software Packages" contains some of the sagest advice since *Poor Richard's Almanac*.

If we had our way, we'd engrave the following excerpt on marble and put it in every computer center in the world:

> "Preparing and running benchmark tests on your computer system is by far the most convincing way to assure the selection of a software package."

Hear, hear! We couldn't agree more. In fact, we market SyncSort *only* via the benchmark route. Our free six-step sorting survey is about the safest "warranty" you'll ever get:

1. A technical presentation in your office.
2. Sort-load analysis.
3. Test outline.
4. On-site demonstration.
5. Tabulation of results.
6. Free testing period.

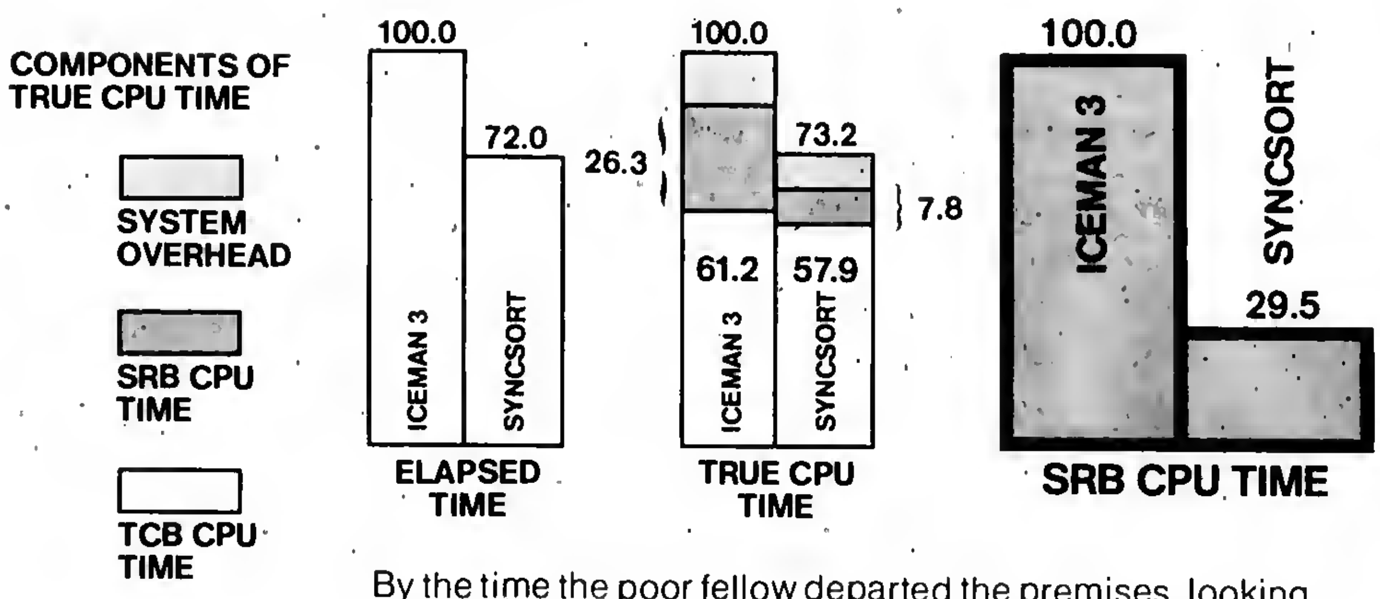
Not every sort vendor shares our passion for benchmarking. In fact, some of them view it as an opportunity to be carefully avoided. Like an all-expense vacation to Devil's Island.

The reasons are not hard to find. Benchmarking can be dangerous—to the health of a sort product that doesn't *really* perform. It can also be embarrassing—to the salesman who's trying to sell a born loser.

Take the incident that occurred a few weeks ago in a data-processing center that Must Remain Nameless.

In came a very nice, very upstanding IBM representative. His intent was to prove, once and for all, that IBM's new SM1-5740, Release 3, was superior to Whitlow's SyncSort III-and-a-half.

As the sun sank slowly in the west, the IBMer rolled up his sleeves and set to work. Benchmark followed benchmark. Hours passed. Results began to emerge. Inevitably, they looked like this:



By the time the poor fellow departed the premises, looking a bit crestfallen, even he was admitting that SyncSort was probably the data-processor's best bet.

It was one of the nicest recommendations we ever received!

Privacy Principles Ignore Global Needs

By G. Russell Pipe

Special to Computerworld

AMSTERDAM, The Netherlands – Opponents of strong, comprehensive private-sector privacy legislation may have won a major victory in the U.S., but framers of European privacy laws are likely to be sorely disappointed.

Analysis

The 600-page privacy study containing scores of policy recommendations appears oblivious to the labors of some 18 countries working on nearly identical issues. Indeed the extensive elaboration of legal reforms needed in personal data practices, tepid as they are, may seem to be a stamp of disapproval of American recordkeeping.

Europeans expected an extension of the Privacy Act of 1974, albeit with modifications, to give blanket coverage over personal records maintained by commercial organizations. Most countries of Scandinavia, Central Europe and the UK are approaching privacy by framing laws of general application, usually a single statute for public and private records. This has become a sine qua non for transfer of data between countries.

Without common basic rules, such as the Swedish and German laws provide, the U.S. DP industry will have to rely on congressional action in some 14 fields.

Because the commission saw a need for specific recommendations in these areas, European officials are likely to take this as evidence of deficiencies in collection, maintenance, use or dissemination practices which, they believe, must follow their data wherever it is located. Thus, until separate medical, banking, insurance, personnel record and other sectoral laws are enacted, some foreign governments may contend that the absence of protection should result in restricting personal data sent to the U.S.

The scantily detailed Federal Privacy Board proposal would not meet even minimum objectives of most such bodies being considered by other countries. The likelihood that such an American board would meet basic reciprocity requirements is, at most, wishful. Further, since such a board would be limited to monitoring federal agency activities, leaving the private sector unshepherded, a large gap exists in the jurisdiction it would have with European counterparts.

94% DISCOUNT
IN QUANTITIES OF ONE

Why spend $150,000 or more for a firmware system when our's can give you the same End results for less than $300/mo, (60/mo lease plan). Remember us! We're that "FREE SOFTWARE" company that provides you with thousands of dollars of software for just a little more than the cost of the paper its' printed on. NOW we are going to virtually give away our "Firmware System" at mere fractions of everyone else's prices. How can we do it? Well – Just like we did with our software: by providing a quality product at very nominal prices and relying on volume for our profit instead of making it off you! Unlike some of the other advertised systems we offer a TOTAL system package with mass memory, video display, line printer, operating system, plus a full Application Software Library. Software packages available with the system include: Payroll, Inventory, General Ledger, Medical Record Keeping, Word Processing and more. Entire package includes everything above plus system tutorial, more than 600K Bytes of formatted disk storage and over 65K Bytes of RAM. Assembled and ready to use. Complete Unit price $8999 plus shipping. Leasing plans and national service available from any of our 134 dealers.

Carter Pledges Support

(Continued from Page 1)

ber, Internal Revenue Service records, public assistance, social services and government access to personal information.

Not to be outdone, Sen. Birch Bayh (D-Ind.), who chairs the Senate Judiciary Committee's Constitutional Subcommittee, also chose the day the privacy commission's report was released to introduce legislation designed to prevent the indiscriminate use of polygraph tests by government and private enterprise employers. His subcommittee will soon hold hearings on this "Polygraph Control and Civil Liberties Protection Act," Bayh promised.

Sen. Charles H. Percy (R-Ill.) summed up the mood in the Capitol concerning the commission's report when he observed during the hearing that "privacy makes strange bedfellows . . . It is an issue that cuts across ideologies."

Linowes repeatedly expressed his appreciation for the enthusiastic response to the report, entitled "Personal Privacy in an Information Society." He added his hope that that response would be just the beginning of "vigorous and quick action" on the part of the President and the Congress to rectify "some of the systematic problems" identified in the commission's 162 recommendations.

Referring to the Koch-Goldwater bills, Linowes noted that "a single sweeping solution to the privacy problems this nation faces won't do justice to our economy." Accordingly, the report's recommendations and their attendant legislation seeks "to keep clearly in mind" the diversity of the institutions, records and rights of individuals involved.

Tailored to Specific Industries

While privacy laws for each area of the economy will be tailored to specific industries under the commission's plan, certain guiding privacy principles will be found in all this legislation, the chairman added [CW, May 9].

These principles include the right of an individual to see, copy and correct his record and the right to authorize an organization to transfer the information it has about him, Linowes said.

Organizations – public or private – should use personal information only for the purpose for which it was collected, he stated. In addition, they should collect only that information which is relevant to the decision being made.

Organizations would also be expected to put an end to secret records and holding investigative interviews under false pretenses, Linowes stressed.

If these principles are followed, the nation will go a long way toward preventing unwarranted intrusion into an individual's private affairs and keeping inaccurate records from causing unfair decisions about an individual. It should also help protect the individual's interest in disclosures made from records about him, the commission's report stated.

The privacy commission concluded that Congress should not apply the specific requirements of the Privacy Act of 1974 outside the federal government. Instead, Congress and state governments should mandate access and correction rights tailored to particular types of recordkeeping relationships as proposed in the Koch-Goldwater bills.

The commission intends, through a mixture of legislation, regulations and voluntary compliance, "to tell society how it expects it to behave and then leave it alone as to the details by which it reaches privacy answers," Commissioner William O. Bailey said.

"We have no desire to bind private institutions into a straightjacket of rules and regulations," the insurance company executive added.

There are only two areas of the private sector in which the commission recommends voluntary compliance with privacy guidelines, however. These are employment and mailing records, Linowes said.

A "legally enforceable expectation of confidentiality" should be applied to the records that credit grantors, banks, insurance companies and doctors and hospitals maintain about individuals, the commission concluded. Long-distance telephone records should also be covered.

"We aren't saying the government doesn't have a legitimate interest in examining records on an individual in some instances," Linowes noted. "But the individual should have the right to protect that record. The government shouldn't be allowed to conduct a fishing expedition."

The chairman maintained there are "no burdensome costs" in any of the commission's recommendations. While individuals would be able to seek damages for privacy infringements in the commission's scheme, the liability of the record keeper that complies with an individual's request for access to its records about him would also be limited.

"The commission wants organizations to invest in improving their recordkeeping practices, not to spend their money in costly litigation over past practices and honest mistakes," Linowes said.

The recommendation that the President and the Congress consider establishing an independent privacy "entity" to monitor the implementation of the commission's suggestions and to help streamline the federal privacy protection requirements that now apply to government agencies drew considerable comment and several questions from the senators and congressmen.

The commissioners stated they made this recommendation deliberately vague.

"The only message this commission wants to get across is that privacy is a phenomenon that should be dealt with in a centralized fashion," Linowes stated.

Added Bailey: "We've been very specific about the functions this board would have." Among that entity's functions would be advocating privacy, giving the issue "front burner concern," he said.

Commission vice-chairman Dr. Willis H. Ware noted that much has been accomplished in the past two years by the Privacy Protection Study Commission operating with a staff of 25 people. "The entity we have in mind would involve tens of people – not hundreds or thousands," he stated.

In the course of its study, the seven-member commission held 60 days of hearings and meetings and took testimony from more than 300 witnesses including credit-card issuers, banks, department stores, mail-order firms, insurance companies, educational institutions, doctors, hospitals and federal agencies, including the Justice Department and IRS.

New York Systems Hit By Blackout

(Continued from Page 1)

impossible. Without any written backup of reservations made, confirmations were also impossible.

When the blackout occurred, the computerized radar systems used to control air traffic at Newark, Kennedy and LaGuardia Airports switched automatically to stand-by gasoline turbine generators, and air traffic radar control was uninterrupted, according to an FAA spokesman.

Some ground facilities at the airport were knocked out, however, and both Kennedy and LaGuardia Airports were closed down temporarily by the Port Authority.

Elsewhere, even within the LaGuardia terminal buildings, all was in darkness, a traveler said.

During the great power blackout of 1965 when the entire east coast from Maine to Washington, D.C., was affected, there were few computer systems in operation that had a direct impact on the public.

Award 'Irregularities' The Issue

HEW Investigators Probe On-Line Systems' Contract

By Don Leavitt
Of the CW Staff

WASHINGTON, D.C. – An internal investigation at the Department of Health, Education and Welfare (HEW) is probing how a computer services contract was awarded two years ago and if the winning bidder had an unfair advantage.

The investigation is centering on "possible favoritism, gratuities or other irregularities" in connection with the original contract award, and not particularly with the performance of work done under the pact, according to Robert Wilson, spokesman for the department's Inspector General.

Edwin B. Parker III has been relieved of his duties in connection with the Office of Education project covered by the contract. He has been "detailed to other duties at full salary pending completion of the investigation," Wilson added.

The project involves the automation of the Guaranteed Student Loan Management System under which HEW monitors the status of "millions of students, 8,000 post-secondary schools, 10,000 to 15,000 banks and loans amounting to some $10 billion," according to Parker's replacement, Maurice Tansey.

HEW auditors and investigators are also looking into the close relationship between Parker and Gilmore S. Wheeler, a consultant hired by On-Line Systems, Inc. (OLS) of Pittsburgh, to whom the contract was awarded in 1975, according to a report in the Detroit News.

An article in the *Wall Street Journal* quotes an unidentified HEW official as saying the probe is focused more on HEW employees than on the contractor. The department is concerned there may have been violations of its code of conduct for employees, he said.

Punishment could range from a reprimand to firing, the *Journal* added.

The Detroit News quoted OLS president Jack Roseman as saying he was "shocked" that the probe was "even referred to as an investigation.

"As far as I know it's just a review of our program to make sure everything is documented. We welcome that kind of review," he added.

OLS issued a statement earlier this month, acknowledging that HEW is conducting an "audit and investigation" of the procurement of the original contract and "certain OLS expenses, primarily related to business meals of [Office of Education] employees incurred during its term."

The company also "understands" HEW is investigating "certain other" contractors for similar reasons, the statement continued.

Wilson clearly disagreed with those assessments. "This certainly is an investigation. It is not a common thing. It is unique," he countered. He would not say, however, how many people are on the investigative team, how it is organized or how long the probe will last.

'Matter of Some Priority'

The investigation began two or three months ago and the department now senses that it is "a matter of some priority to get it done," he said, lending credence to estimates that the probe will wind up within months and "possibly within weeks now," in the words of one observer.

The Inspector General's office at HEW was created by Congress late last year and is organized as three groups, focusing on auditing, investigations and health care system reviews. *Detroit News* reporter Seth Kantor said both auditing and investigative groups were active in the probe.

The ties between Parker and Wheeler are social as well as professional, according to Kantor, who noted that the consultant served as best man at Parker's wedding in June.

That had no effect on the contract award two years ago, according to Wheeler, who told Kantor that Parker "insisted on withdrawing himself" from participating in the contract review at HEW which led to OLS getting the contract.

Wheeler admitted to Kantor, however, that one of the charges HEW is probing is that "information was supposed to have been advanced from inside HEW to On-Line before the bidding began." If true, that could have given OLS an advantage in making its presentation to HEW, Kantor noted.

The loan program started in 1969 and by 1975 there was a pressing need to get the automated management system up and running on equipment outside HEW since in-house facilities were already overworked, according to Tansey.

There was no time to develop custom software and the OLS proposal, involving the use of software capabilities the network already had in place, was the best of all that HEW received, he added.

Contract Terms

The contract, initially for one year but with two one-year extensions at the option of the government, covered adapting OLS software to the project needs and processing the work once the programs were ready. Both extensions have been exercised by HEW and the contract has amounted to a $7.5 million piece of business for OLS.

Essentially all of the system is operational now, tied to the On-Line data center in Pittsburgh, Tansey said. Development work continues, however, as the original programming is optimized to particular tasks and modified to meet changes in the law.

In an interview, OLS chairman John Godfrey took exception to news reports which focused on how the contract has grown in value. He said he was bothered, for example, by stories which compared the first year price of $1.6 million to the three-year figure of $7.5 million.

He also noted that OLS was able to implement the system faster than expected – "thanks to our software" – and production work, "which is absolutely essential if the government is to control the loan program," got started earlier than initially expected.

You're not looking for a job... but we're looking for YOU.

You've made a significant contribution to the company that you are with. You're in a comfortable position, but all that new technology intrigues you, and you know that given the right environment you can create.

We're INTERDATA, and our technology and opportunity for people to create has brought the industry the 32-bit mini and the microprogrammed mini. Our Advanced Development Group needs more hardware and software professionals who are as confident as we are. Together, we can be the future of computing.

Is 5x7 Dot-Matrix CRT Terminal Tomorrow's Endangered Species?

By John P. Hebert
Of the CW Staff

Could a CRT terminal that displays characters in a dot matrix format be on the endangered species list in the near future because it's hard to read?

Definitely not.

But although terminals with the 5 x 7 dot-matrix type of character generation are most widely used because these units are cheaper, other types of terminals are currently available, and at least two manufacturers are experimenting with still other alternatives.

Some commercially available models generate characters composed of a greater density of dots or use line segments or strokes for character generation.

Other terminals use plasma gas, light emitting diodes (LED) and liquid crystal media. However, these are limited to displays ranging from a few characters to a line or two – and rarely more than three dozen characters – according to a report on alphanumeric display terminals published by Datapro Research Corp.

Datagraphix Corp. introduced a relatively inexpensive display that utilizes fully formed characters at the National Computer Confernece, and IBM is experimenting with a laser beam technology.

Although the present dot-matrix display method is adequate for information reference, it can promote eye fatigue or strain for operators who use CRTs under the wrong lighting conditions and/or for extended time periods.

Fully formed characters are theoretically less fatiguing to read. But eye fatigue or its absence is also dependent on where the terminal is located and how much it is used at one time, optometrists agree.

If a CRT is used intermittently, the operator can get by with the standard 5 x 7 dot-matrix display. But full-time CRT operators using the same display might experience eye discomfort, as might the programmer who spends two hours in front of it in a brightly lit room.

Datagraphix spokesmen declined to comment on the new product.

Experimental Terminal

At IBM's San Jose, Calif., research laboratory, scientists who have built an experimental terminal to demonstrate the laser beam display technology suggested the laser beam terminal as a replacement for certain applications such as engineering graphics or newspaper page formatting.

For most applications, however, they also agreed the CRT terminal presently in use is here to stay.

The major drawback of CRTs, an IBM scientist said, is the cost barrier to displaying more than one million picture elements on a single screen. The laser-written displays do not have that limitation, the spokesman said.

Further, the laser-generated characters are more sharply defined than in CRT displays and appear black on a white background, giving the look of a typewritten page, according to IBM.

The technology utilized in the IBM experimental device has the potential to display characters in a 20 x 40 spot format, the IBM spokesman pointed out.

"We think we can put more elements on the same size screen," in addition to making the screen itself larger than the conventional CRT found in computer terminals, according to the researcher.

There is a drawback, however. This method of scanning takes the laser 50 milliseconds to form a character – or about 20 char./sec.

Although the speed is sufficient for entering information from a keyboard, it is much too slow for displaying information that is already stored in a computer, IBM admitted.

CRT-Bound Workers Strain Eyes

(Continued from Page 1)

Sparks said.

The people most affected by the terminals, he explained, are those who use the device day after day without any breaks. "They are asking too much of their eyes," he said.

The muscles of the eye are like any others – "If you run for 10 miles, your leg muscles will hurt.

"Some people are not suited for this kind of work," according to Sparks, who sees the problem as symptomatic of our society as a whole.

"This computerized world of ours is creating problems for our eyes. The population is becoming more and more nearsighted because more people are working in closed rooms and confined spaces," he said.

Recommendation to Doctors

Sparks believes doctors should observe and experience first-hand the conditions related to patient complaints. His travels through computer rooms and CRT terminal clusters have led him to some conclusions concerning those who use and manufacture the devices.

Vendors could come up with a better glass to prevent glare, he said. Employers should eliminate glare in offices and try to achieve a point of equilibrium between the brightness of the room and the brightness of the CRT screen.

Related to this is the use of the proper lighting on the screen. A CRT terminal should always display illuminated (light) characters on a dark background.

The dot-matrix print displayed on the terminal screen or found on a computer printout is "horrible," Sparks said. This type of character – generated by a wide variety of CRTs and computer printers – is very difficult on the eyes. The operator or printout reader must constantly try to bring the characters into focus, forcing the eyes to work harder, according to the doctor.

Breaks Suggested

For people who use the terminals, Sparks suggested they often look up from their work, take at least a couple of nonreading breaks during the day and blink their eyes.

Full blinking, he said, is very important because it ensures the eyes get necessary oxygen. Depriving the eyes of oxygen will cause them to swell, as it will any other body tissue, he added.

Apparently, there never has been a formal or informal U.S. study performed on the effects of CRT terminals on their operators.

Dr. Paul Lappin, dean of the New England College of Optometry in Boston, doesn't think working with a computer terminal is any more stressful for the eyes than reading a book.

"If you do it all day long, it will be fatiguing," Lappin said, but "there is nothing about the [CRT] per se" that contributes to eye stress any more than other close-work situations.

Old Question

The question of whether eyesight is adversely affected by such situations is an old one, Lappin said, recalling experiences with radar screen operators' complaints of fatigue.

"Eye fatigue in the radar operators was difficult to diagnose or even define," he explained.

Congressional DP Service Seen Enmeshed in Politics

By Edith Holmes
Of the CW Staff

WASHINGTON, D.C. — Politics inevitably becomes an element in the systems design of any DP effort which directly impacts members of Congress, according to Dr. Frank Ryan, former director of the House of Representatives Information Systems (HRIS).

Speaking at a conference of DP executives here recently, Ryan, who left HRIS to become director of athletics and a member of the mathematics faculty at Yale University, compared his old operation to a service bureau created to develop applications that would better serve Congress.

Service to Congress, however, is more an art than a science, Ryan said. He found the systems developed to meet particular problems of members of Congress during his tenure as HRIS director are valued by the Representatives for very different reasons.

The beginnings of HRIS itself are rooted in politics. When the idea of using computers in the House was first discussed in 1971, Wayne L. Hayes (D-Ohio) had just risen to become chairman of the Committee on House Administration and the number of telephone lines running into each member's office was the primary information issue, Ryan said.

HRIS was initially "a little vendetta" started under the Administration Committee as a result of a debate between Hayes and the Clerk of the House over who should be responsible for House DP, he stated.

Ryan, who played quarterback for the Cleveland Browns and then for the Washington Redskins, said he was thankful to have been in football before he got to the House. "There are anxious, hungry and tough people in the House as well as on the field," he explained.

When Ryan and his staff designed the House's electronic voting system, they thought that it would help Representatives vote faster. Used for the first time on Jan. 23, 1973 for a quorum call, the system, which runs on dual Control Data Corp. 1700 mainframes, saved approximately 500 hours of legislative time that would have been needed to answer roll calls without it.

'Strategy Devices'

But the Representatives liked the system for reasons other than its reduction of voting time from almost 45 minutes to 15 minutes. For example, the manual voting system had had a high instance of errors in recording votes.

It also permitted "ghost voting" by members not even in the Capitol when a vote on an issue was taken.

Today, members of Congress can look at almost any subset of Representatives whose votes they want to track using CDC terminals on the House floor and in their own offices. The CRTs have become "in-progress strategy devices," Ryan said. He added that the system has given the leadership in the House more control over its followers.

Members now vote about twice as much as they previously did, but gamesmanship has come into play in the casting of votes, the former HRIS director noted. The House has had an unprecedented set of tie votes, for example.

When the CRTs were first installed on the House floor, Ryan said, members reportedly sat at the terminals, pressing the buttons to change their votes back and forth and watching the changes register on the display panels located around the chamber.

Another system designed to track the status of legislation has been very popular, attracting approximately 1,200 phone calls on particular bills each day with a 2:1 busy signal ratio at the Bill Status Office, Ryan said. The system relieves congressional staff people from the tedious chore of following a bill through the legislative process.

Resistance to Comis

Still another system, the Committee Meeting Information System (Comis), intended to alleviate the high instance of schedule conflicts on a given legislative day, also has run into flack.

The problem is that the committees don't want other committees to know which of their rooms are available. The dynamic scheduling system would have all committees report the meetings they plan to a central data base that would help staff workers assigned to arrange meetings avoid conflicts.

HRIS has tried to get the committees to use Comis for two years. In addition to not participating in the system, the committees have also created "ghost meetings." HRIS is now trying to bring committee meeting information together without room information, Ryan said.

Explaining HRIS' current effort to develop a communications network with a terminal in every member's office, Ryan said when they have their own devices, they're "generally happy, regardless of what they do."

He cautioned DP professionals to be aware of the perception Congress has of computing.

Representatives will look at issues in the industry, like those involved in the Consumer Communications Reform Act — better known as the Bell Bill — with the same understanding of DP that they have in their own environment, he said.

Three Managers
we can
probably get home earlier:

OS, OS VS Our PLAN IV program product processes IBM SMF data to provide comprehensive information for system management — all levels. Highly readable reports add perspective, sharpen tuning, balancing, capacity planning. You'll wonder how you lived without it.

MVS Our PLAN IV:MVS uncomplicates the most complicated system going. Provides meaningful correlations, analyses needed for capacity planning, tuning, balancing, leveling, more. Uses built-in SMF, MF/1, RMF facilities. Produces concise, graphic reports.

COBOL Using techniques inaccessible to programmer or compiler, our OPTIMIZER II automatically sharpens, cuts, produces more efficient object code. Results: an average of 10% saving on CPU time, 20% on real store needs. Any IBM 360/370 OS, OS/VS system. Another big aid: our COTUNE II analyzes program execution, shows if all paths have been tested and where CPU time is consumed. Leads quickly to more reliable, efficient programs.

Each of the software packages above is thoroughly detailed in individual literature. You name it, we'll rush it.

Micro-powered Chess Challenger provides chess enthusiast with built-in opponent — all for $200.

Micro-Controlled Challenger Plays 'Unnerving' Chess Game

By Molly Upton
Of the CW Staff

ROCKVILLE, Md. — Those who have the urge to play chess but who can't find a partner can eliminate their frustrations hy playing with Chess Challenger, a microcomputer-controlled game.

The player indicates his moves by inputting the position to which he is moving a piece on a 12-key control pad. There is no need to identify which piece is being moved because the Challenger retains that information from previous moves, according to Harry Krause, marketing manager for Chafitz, Inc., an electronics specialty store here.

The game then responds with its own move, usually within one second, and the new and old positions of the Chess Challenger are displayed in four light-emitting diode characters, Krause said.

The game was developed by a medical electronics engineer and incorporates an Intel Corp. 8080 microcomputer, which is programmed to play an aggressive game, Krause said.

The Challenger assigns a value to each piece and goes for board control. "If you're not very careful, you lose," Krause said.

Improves One's Game

One can also improve one's chess game through repeated encounters with the Challenger, he said. When Krause started, he lost 18 out of 20 games, but he is now splitting on a 50-50 basis, he added.

However, having one's opponent react so quickly can be "a bit unnerving," he warned.

"We've even had parents who play chess buy a Chess Challenger for their children who are just learning the different pieces and moves," a spokesman said. Once beginners learn the basic moves, they can practice games and strategy and hecome a decent player in a relatively short time.

Chafitz is the exclusive direct distributor, although the unit can be found in some department stores, Krause said.

Beginning in July, Chafitz expects to offer two other degrees of difficulty for the game by incorporating another micro, he said. First priority will be to retrofit current customers' games, he noted. The upgrade will cost ahout $75, and the Challenger costs $200.

The existing game has instructions enahling players to make the computer move first or set up special problems, Krause said.

Chafitz is at 1055 First St., Rockville, Md. 20850.

EFT Commission Gets Revealing Feedback From General Public

By Frank Vaughan
Of the CW Staff

HOUSTON — When commissions meet to ponder such weighty issues as electronic funds transfer systems (EFTS), even the hest minds can overlook the questions which are of great concern to the public.

Wayne Boucher, who has been serving on the National Commission on EFTS, related one of the unusual aspects of the commission's efforts at the 5th Annual International Conference of the EDP Auditors Association here.

As a result of an erroneous wire service news story, the public was told the commission was seeking public comments on EFTS, and 6,000 letters arrived at the commission's offices. Only 11 were in favor of EFT, 10 were "uncertain" and the rest were against it.

Rather than ignoring the letters, the commission compared their contents with its concept of what constraints should be placed on EFT systems.

The commission had been examining such aspects as controls, use, impact on fiscal and economic policies, cost henefits, the management of information and privacy, recordkeeping and telecommunications.

Religious Implications

The concerns of the puhlic matched the areas the commission was examining with one exception: religious implications. A good numher of the letters received quoted the Bible's Book of Revelation and voiced a concern that the move to electronic funds was one step further in man's race to the "last days."

People feared they would soon have their Social Security numbers printed on their foreheads by laser beam without their knowledge," he explained.

Determining Your Direction.

As you continue to expand your Data Processing operations and serve more and more users, the requirement to better manage the direction you are taking increases.

One of the first steps in determining the direction your data processing operations are taking requires that a reference point or a data base of operating information be available.

The Value Computing Comput-a-Charge system provides you the facilities to develop your data base of operating information.

Next, you require a set of tools and facilities which will allow you to analyze your data base of operating information to determine the direction you are going.

The direction or trend of your operation may vary from month to month. A question you must ask is what is your current direction or trend in the following areas:

- Detail device utilization information
- Demand for resources by application
- Trends among various applications
- Daily shift performance
- Reruns & Abends
- Troublesome application programs
- Device contention problems
- Consistency in billing and cost distribution

With the Comput-a-Charge system you have available a complete set of reports and graphics that will pinpoint your trends and direction.

To satisfy your special reporting requirements, Valu-Gen, the Comput-a-Charge report writer subsystem, is available and enhances the use of the data base of operating information.

Comput-a-Charge is currently assisting data processing managements account for and better manage their total operating environments. The system supports *all* IBM operating systems environments including IMS and CICS. Comput-a-Charge is also available for Burroughs, CDC and Univac environments. If you're interested in defining the right direction for your operations, contact us at **800-257-8242** or send us this coupon.

Attn: Mr. James Byrne · Vice President

ABSOLUTELY NO DISTRIBUTED PROCESSING SYSTEM OFFERS YOU ALL THESE 10 FEATURES EXCEPT SERIES 21 FROM MDS:

1. An intelligent data entry system which installs as easily as a keypunch and is fully operational as soon as you plug it in.

2. Formatted data entry software—fully developed and ready to use.

3. On-site upgradability so you can utilize a powerful programming language specifically developed for interactive processing with CRT/Keyboard.

4. Growth capability so you can accommodate your peak production periods by allowing expansion to up to four operator stations—any time—on one controller..

5. Modular design so you can configure a system to fit the requirements of your various locations—exactly, now and for the future.

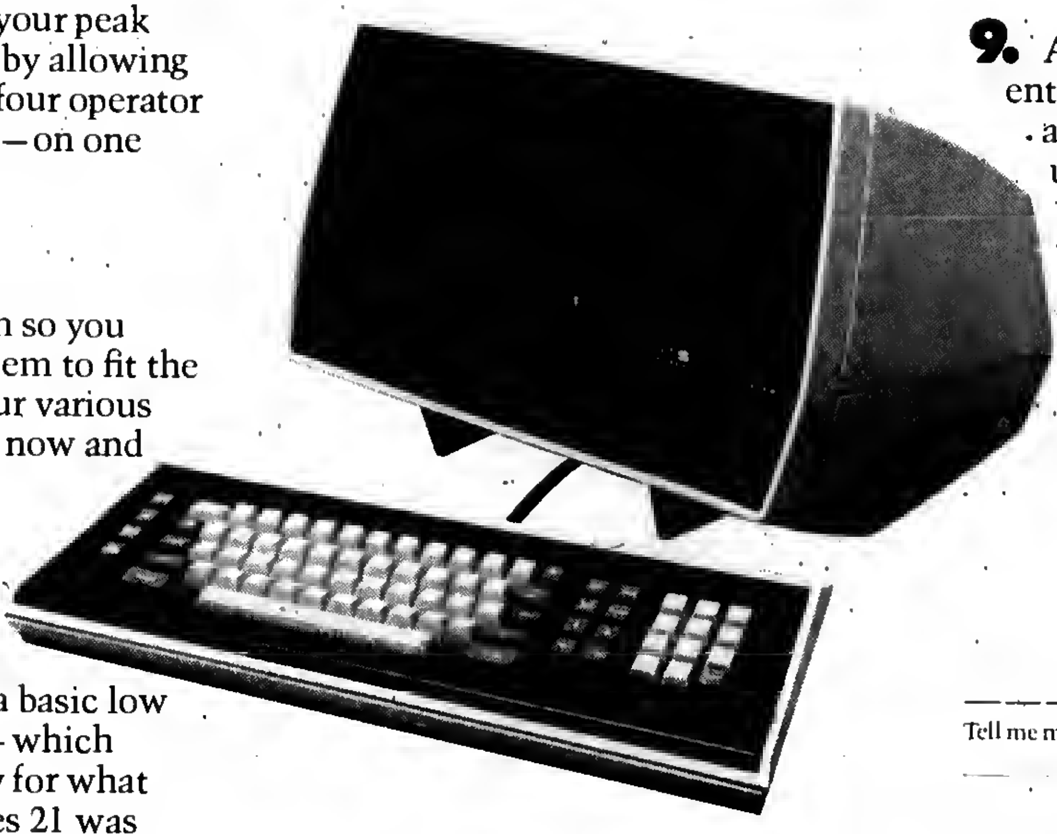
6. A comprehensive line of peripherals, like large capacity disk drives, tape transports and printers, together with powerful systems software enabling high performance transaction processing.

7. Communications in BSC or SDLC, or both.

8. A large 15-inch CRT display in 480 or 1920 characters for easy operator prompting and sight verification of data.

9. A choice of either data entry or typewriter-style movable keyboards so you can use experienced data entry people or those with only clerical experience.

10. Popular flexible diskette recording media using IBM Basic Data Exchange conventions.



You can start with a basic low cost configuration—which means you pay only for what you need now. Series 21 was designed to take into account all your future distributed data processing system requirements by way of its upgradability. A Series 21 system with 4 operator stations costs only $110.50 per month per operator station, including maintenance, on a 3-year lease.

We would like to tell you more about Series 21—and why we say it's absolutely the best distributed data processing system available anywhere.

Series 21—a solution for today—and tomorrow. Call MDS Executive Headquarters at 201-540-9080, or fill out the coupon and find out more.

THERE'S A WORLD FULL OF MDS SOLUTIONS.

Technicians Prepared for Tomorrow

DP Operator Training Seen Aimed at Today's Tasks

By Ann Dooley
Of the CW Staff

DALLAS — The training provided for computer operators in a production-oriented DP center has different goals from that aimed at a more technical and highly educated staff, two DP training experts at a recent conference here agreed.

Because of time and money priorities, operators are trained to function at their assigned tasks, while a more technical staff is often trained for career growth and knowledge enhancement, they said.

Jack Stone, owner of Computer Education International, Inc., described to attendees his method for improving performance and employee activity in medium- and large-scale computer centers.

Training is an art form, Stone said, but trainers must get more responsibility in order to be more effective at their jobs.

Sometimes various kinds of employees are included in the training sessions — secretaries as well as DP personnel — and everyone wants help with their particular problems. And when the training period lasts only a few days, it's impossible to solve all the problems, he said.

One way of alleviating the difficulties is to find out what the key problems are before the training begins, Stone noted.

A training proposal should be circulated to the client so employees will start talking and thinking about the program. The proposal should he sent all the way down the line so the operators, who will be most directly affected, will have a chance to contribute their ideas, he said.

Such an effort is worthwhile since the students appreciate being included in designing their own development program, Stone added.

For the most part, the attitude of the operators and other DP pesonnel is very negative. "There's a lot of hostility," he said, because they feel undervalued and ignored."

Problem of Resentment

When a problem with the computer occurs, the operators don't know what to do, so the system analyst comes in and takes over and the operator resents it.

While there is a growing awareness of the need for training, it is often done in a "slapdash way." The usual excuse is that a company's employees are too busy to take time out for training.

But what kind of product are they developing? Stone asked.

Cost-effective training should teach only the skills that the operator uses today's DP environment, according to Stone. "That's all you can expect — better skills today," he said.

Providing training time away from the current job is crucial to learning, he said. People must have time to think and reflect on what they've heard or they won't remember it, he stated.

The program should offer only a limited objective as to how much the trainees should learn, he said. They don't need to know more than the elementary concepts of the system. But right now, they don't know anything about what's going on and "yet we entrust them with a thousand-dollar environment," he added.

A basic problem with which operators must deal is that they have no identity — they have no desks of their own or individual working areas. They want to become programmers because they feel they will be identified then, Stone said. The problem is that many of them don't have the communication skills or business backgrounds to be programmers, he said.

Honeywell Program

In contrast to Stone's training program, Lawrence Lunetta, manager of the Advanced Engineering Program at Honeywell Information Systems described how Honeywell's program attracts and places "knowledge workers." It must be determined who the knowledge worker is, what he's doing and where he works best, and that can't be found out in a typical training program, he said.

The Advanced Engineering Program helps the knowledge worker determine alternatives by rotating his work assignments, Lunetta explained. Each student is provided with a wide variety of experience in hardware and software over the three-year program, he said.

Each program member receives a graduate or doctoral degree from Arizona State University, time off from work and most expenses paid, Lunetta said.

In addition, internal training is offered including lectures, seminars and hands-on training, most of which is customized to Honeywell equipment, he said.

Students Recruited

Although program members were originally recruited from within the company, today most students are recruited from universities. It was discovered that employees with well-established lifestyles found it difficult to devote the 60 to 80 hours a week the program sometimes demanded, according to Lunetta.

Recruiters look primarily for someone with a B.S. in electrical engineering or computer science who is in the top 5% of his class, he said. Applicants must be highly motivated and regard the program as a reward because they consider themselves "more special than others," Lunetta said.

Currently, there are 26 students in the program, with a yearly turnover rate of 10 to 15 people in the form of incoming and graduating students, he added.

The program offers education plus experience, special opportunities, a company commitment to develop each member's skills, varied work assignments, internal training and "being exposed to the leading edge of technology," Lunetta said.

The company benefits by bringing in top talent from around the country, he added, and the retention rate has been over 80%.

The program creates a balanced system providing the student with career flexibility while the company gets critical work accomplished. The student has special opportunities and the company is provided with future leaders.

While Stone admired such a program, he said it was unrealistic to attempt in a production-oriented environment.

The pioneer of small business computers now makes small business computers.

Actually, Basic/Four Corporation has been making its own central processing units since August, 1976. We now make our own terminals, too.

We wanted tighter rein on manufacturing and testing, choice of the latest components, total control of quality, production and delivery. So we could offer even more reliable, better products.

Now we do.

The Basic/Four® CPU's new semiconductor memory means 40% faster cycle time, down from 1 microsecond to 600 nanoseconds. New models make expansion even easier, accommodating one to 16 terminals. There are other improvements, too, with more to come.

And the Basic/Four systems we make have been running, bug-free. Just like before—only better. The best small business computers available.

All-around simplicity

We also made sure our system would be the easiest to install. And operate.

The software uses BUSINESS BASIC. And we have applications modules that are preplanned and packaged, including such eminently usable programs as CBS (Comprehensive Business System) and EASY, an exception analysis system. Plus a multitude of specialty packages. For hospitals, insurance, travel agencies, bond brokers, banking, the apparel industry, trucking, publishing—literally dozens, and more on the way.

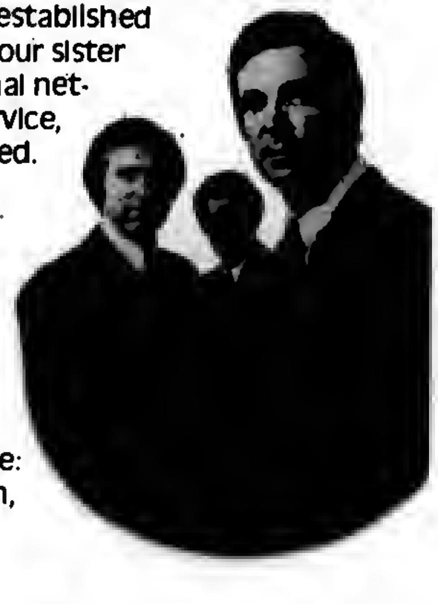
Full time commitment

Our specialty is small business computers; it engages our full attention, dedication and effort. And, of course, as the pioneer, we've been at it longer. Long enough to have established through SORBUS INC., our sister MAI company, a national network of support and service, 24-hours a day, if needed.

All this leadtime and concentration keeps us ahead.

And now we make our own. So we *know* we're offering the best.

If you'd like to know more, call or write:
Basic/Four Corporation,
18552 MacArthur Blvd.,
Irvine, CA 92714



Look to the pioneer

Ever since we pioneered the field, our operating system has been acknowledged as the best of any small business computer. It had to be—because our systems were always interactive, even when others were batch.

Nowadays, everyone in the field is talking "transaction processing"—following our lead, some six years later!

"IDMS has the best documentation."*

*say users in Datapro study

In the fourth annual Datapro Research survey of software users, Cullinane's IDMS was rated #1 among all Database Management Systems. #1 in Overall Satisfaction. #1 in Ease of Use. #1 in Ease of Installation. #1 in Training. #1 in Vendor Support. And #1 in Documentation.

Being tops in documentation isn't easy. It takes serious commitment. It also took a big investment, and outstanding technical writers, editors and production specialists to create the best DBMS documentation in the industry. Through the dedication, enthusiasm and leadership of William Casey, a vice president of Cullinane Corporation, our documentation team has a long list of important developments to its credit.

This past year alone they've introduced: 1. Quick-Reference Cards for programmers and DBA's. 2. IDMS Database Design & Definition Guide. 3. IDMS Installation & Operations Guide. 4. IDMS Concepts & Facilities Guide. 5. Regular Technical Bulletins, including hints on system use, etc. 6. IDMS Programmers Reference Guide. And that's just part of it.

For the complete story — including technical literature on IDMS and a schedule of seminars for your area — complete this coupon or phone us at (617) 237-6600.

Think twice. You'll pick the database system users rate #1.

Pushbutton System Gives Teacher Students' Feedback

By Ann Dooley
Of the CW Staff

CLEVELAND — Students at Case Western Reserve University here can tell at least one of their professors what they think of his teaching under an experimental program designed to improve communication.

The Olin Experimental Classroom study utilizes student-activated electronic push-button boxes, TV cameras and a Texas Instruments TI 960 process control computer, according to associate professor James L. Rodgers.

While student response systems have been used in this country and the Soviet Union for some time, these previous systems would allow the students to respond only at the teacher's initiative and only on a multiple-choice format, Rodgers said.

Using the experimental classroom and a 12-button key set, each student can respond within the format provided by the teacher. Although the student is limited to 12 responses in declaring his actual feelings, he can indicate such feelings as confusion over a lecture point, the wish to speed things up, the fact that he's bored with the material, or anything else that has been programmed, according to Rodgers.

The system isn't limited to any one set of responses, either, he said, since an instructor can change the labeling on the response buttons at any time. The computer, which displays and prints the responses, can also handle data in different forms.

Students Take Initiative

"The most distinctive feature of the Olin classroom is that students can respond at any time on their own initiative. A student who does not understand a point can indicate his confusion as soon as he realizes he is missing something," Rodgers pointed out.

The instructor has the ability to either monitor student response on the TI desk-top terminal during class or review the class on videotape with the tabulated responses superimposed on the image, he said.

Prof. Krishna Kumar used the Olin classroom for his statistical methods class during part of the spring semester in order to encourage more participation.

"A student may hesitate to slow down the instructor in a traditional classroom because he fears his peers or the instructor may think he is 'dumb.' If the students feel the response is anonymous, they will ask for clarification when they need it," Kumar said.

While the class is in session, the instructor is unaware of who is pushing a button, but the videotape indicates which button on which desk was pushed.

Kumar is currently tabulating results that will indicate whether the system has increased participation by his students.

He compared last year's responses with this year's by counting how many times each student pushed a button and the number of times each of the 12 buttons was pushed. The most commonly used button was "repeat," he said.

Most students liked the experimental classroom because they felt it made the professor more responsive to their needs.

The teacher response has been mixed. Those who might need it most could also be the ones least willing to try it, Rodgers noted.

Another problem is that an interested professor must get his own funding for the classroom since the university does not provide any money toward the operation of the experiment, Rodgers said. So far, only Kumar's class has used the classroom.

Since the project doesn't have any operating money, student programmers were originally used, but the results proved to be very inconsistent, Rodgers said. The project was able to hire a part-time programmer and everything has gone more smoothly since then, he said.

The Cleveland Board of Education recently used the classroom as part of a federally funded project to improve the quality of classroom observation and evaluation. Administrators watched videotapes of several classes and used the response buttons to evaluate the teachers. With a printout of the evaluations, their supervisor was then able to discover areas of agreement or inconsistencies within the group.

COMPUTER FACILITY
BALTIMORE, MARYLAND

1st class computer facility is available on December 1, 1977 as follows:

- 4500 Sq. Ft. 1st floor, consisting of 2000 sq. ft. raised floor computer room 215 sq. ft. tape vault, 2285 sq. ft. of office and data preparation area.
- 1800 sq. ft. basement, consisting of 800 sq. ft. finished office area and 1000 sq. ft. of storage space.
- Computer room and tape vault protected from fire by a Fenwal Halon 1301 detection and suppression system.
- Electrical service to computer room consists of two (2) 400 AMP 240 Volt main feeders, plus transformer for 208 Volt system.
- Forty (40) tons of computer room air conditioning from two (2) units.
- Entire facility wired to an outside security system.

Entire facility is in excellent condition. Most equipment is less than two years old.

The entire 6300 sq. ft. with all improvements is available on a two-year least at $4,000 per month net of utilities and maintenance.

An additional 7800 sq. ft. (4400 recently paneled and carpeted) is available in whole or part and would give tenant occupancy of entire building if desired. Convenient location at I-695 Beltway Interchange.

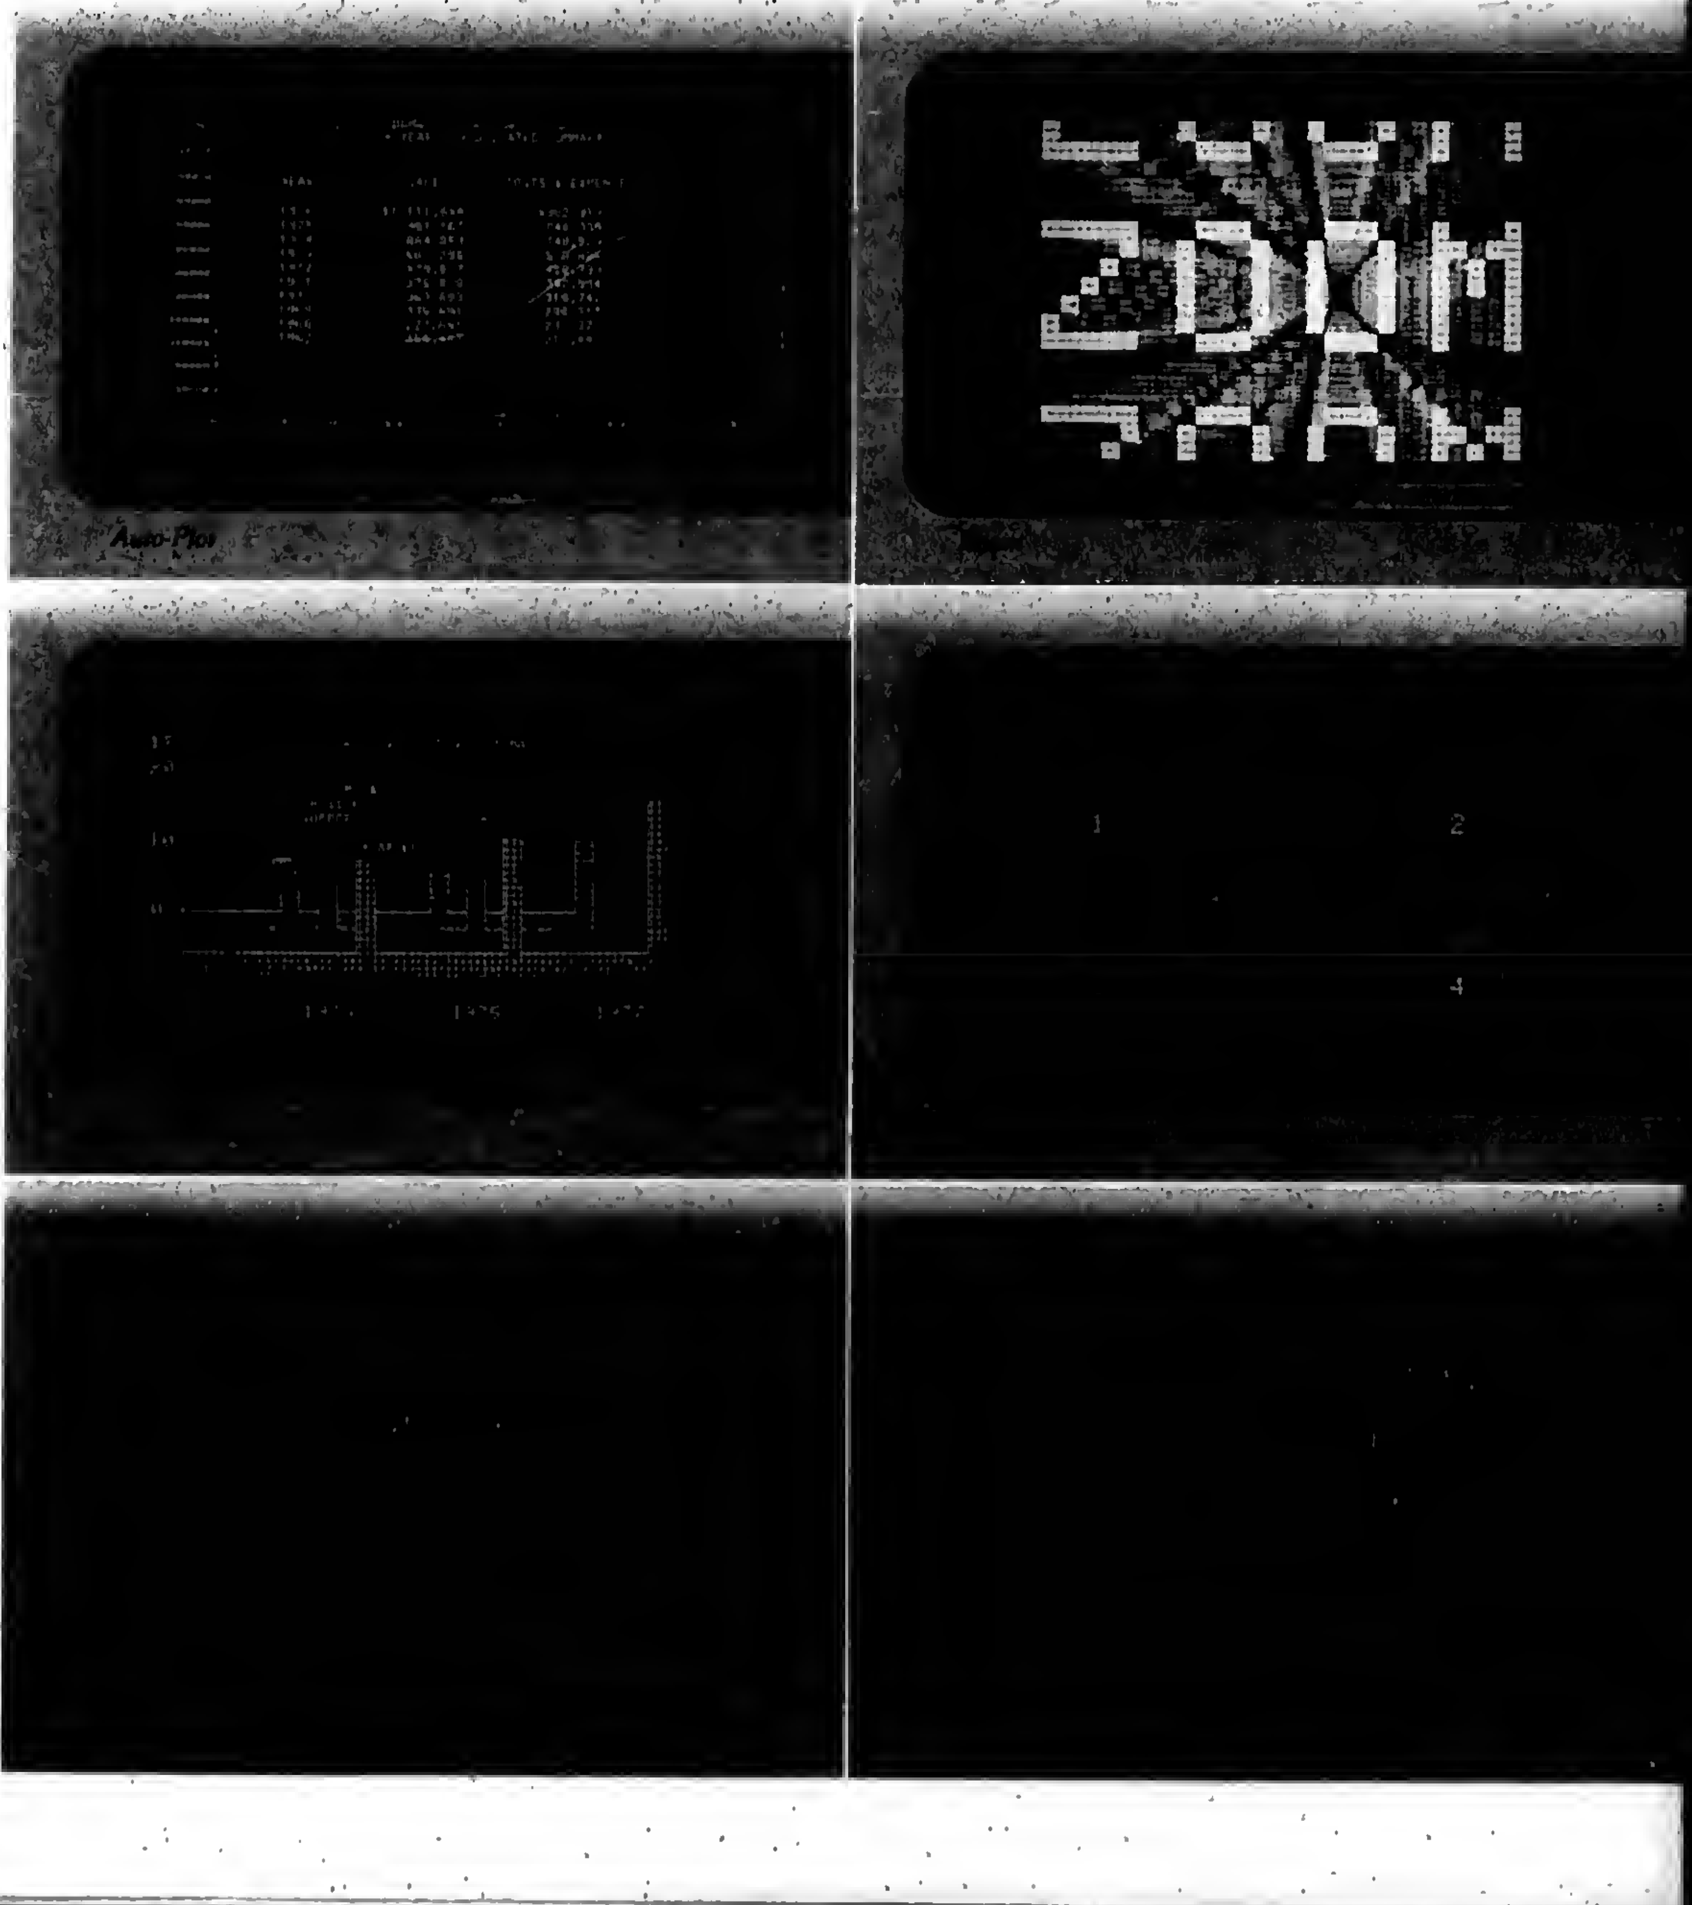
Hewlett-Packard brings a bright new look to low-cost graphics.



ICCP Honors Top CDP Exam Scorers

CHICAGO — Two DPers who received top scores on the 1977 Certificate in Data Processing (CDP) examination will receive cash awards and CDP keys and certificates.

Paul Rosenthal of Gottfreid Consultants, Los Angeles and Samuel T. Redwine of Applied Management Sciences, Inc. of Silver Spring, Md., will receive $250 each from the Institute for Certification of Computer Professionals.

Four individuals shared the top score in programming. They are: Robert L. Schwenk, employed by Pacific Mutual Insurance Co. of Newport Beach, Calif., William LaPlant Jr., who works for the United States Air Force in Washington, D.C.; Manley Reynolds of Mountain Bell in Denver, Colo.; and Moshe Rabinowitz, who works with Metropolitan Life Insurance Co. in New York.

Fred L. Potter, who is employed by Sulloway, Hollis, Godfrey and Soden in Concord, N.H., received top honors in the management portion of the examination, the ICCP said.

Top scorer Rosenthal received the highest grade in quantitative methods and Howard Glen Weekley, who is employed hy the Texas Air Control Board in Austin was the nation's top scorer in systems analysis.

All receive CDP keys and certificates reflecting the award of Excellence and will be honored in their local organizations by ICCP representatives.

ACM Plans Job Register For Computer Specialists

DETROIT — An employment register for matching computer scientists and DP specialists with employment opportunities will be conducted again at the Association for Computing Machinery's Sixth Annual Computer Science Conference here Feb. 21-23.

Previous registers have attracted thousands of applicants who are both experienced professionals and new graduates as well as employers in business, industry, government and academic institutions, according to Orrin E. Taulbee, director of the register.

Anonymous applications are accepted, he added.

How It Works

The register works as follows: Each applicant completes a form giving identifying information, education, publications, experience, interests, references, position and salary desired.

The employer completes a similar form giving identifying information, position available, starting date, salary and benefits as well as education, experience and specialization required for the position advertised.

Three different forms are required, so when requesting forms, people are urged to identify themselves as applicants or employers in academic institutions, business, industry or government, Taulbee indicated.

A separate form is required for each type of position available, but only one form is needed in the case of several identical positions.

Must Be Typed

Completed forms must be typewritten since they will be reproduced exactly as submitted, and no photocopies will be accepted, he said.

Filing fees are as follows: applicants $5 plus $5 extra for an anonymous listing (students are free); and $20 for employers for each job form submitted.

A check for the appropriate amount, payable to the Computer Science Employment Register, must accompany the forms.

Requests for forms should he addressed to Taulbee at the Department of Computer Science, University of Pittshurgh, Pittsburgh, Pa. 15260.

NCC Board Elects Chairman

SUNNYVALE, Calif.— Ralph R. Wheeler of Palo Alto, manager of computer time-sharing services at Lockheed Missiles and Space Co. here, has been elected board chairman of the National Computer Conference.

This policy-making body is responsible for arranging and conducting the annual meeting sponsored by the American Federation of Information Processsing Societies.

Wheeler will serve a one-year term beginning July 1. He moves into the chairmanship after serving on the NCC's board of directors as the representative from the Society for Computer Simulation.

The new Hewlett-Packard Graphics Terminal uses a microprocessor and raster scan technology to combine high performance with low cost.

The HP 2648A introduces a whole range of bright ideas to graphics. There's so much power built into the terminal itself that you can perform everything from auto-plots to zoom without any CPU help at all.

Auto-Plot. You don't need to know programming or invest in costly software. Once you've entered your facts and figures from the alphanumeric keyboard, press a few keys and your tabular data is plotted instantly.

Raster Scan. No more pulling down the blind to make your plots visible. Our display is clear and easy to read even in bright light. And the raster scan technology permits selective erase, cutting down the time it takes to modify your picture also.

Zoom and Pan. This lets you magnify any area of the display up to 16 times. And you can pan in any direction for closeup investigation of complex designs, without having to reinitialize the data.

Area Shading and Pattern Definition. This makes it easy to distinguish areas with similar shapes, such as bar charts, mechanical parts and architectural drawings.

Rubber-band Line. You can draw trial sketches, such as architectural floor plans, with or without CPU connection. Think of the time and money you'll save by cutting down mistakes.

Independent Display Memories. Both alphanumeric and graphic data can be shown independently or at the same time. And you can carry on a dialogue with the CPU without disturbing the picture.

The HP 2648A also has all the advantages of our popular HP 2645A alphanumeric terminal. Specifically: mass-storage on 110K byte cartridges (you can store graphics as well as data); 'soft keys' to speed up repetitive jobs; one-button self-test; plug-in PC boards for easy maintenance; extensive data communication and off-line capabilities.

This bright new look in graphic terminals is designed for such applications as electrical, mechanical and architectural design. For process and control. For scientific plots. And for business planning.

We'd like to give you a graphic demonstration of everything the HP 2648A can do. Send us the coupon and we'll set it up. Or contact the nearest Hewlett-Packard sales office listed in the White Pages. We're sure you'll get the picture.

Yes, I'd like to take a closer look at your low-cost HP 2648A Graphics Terminal.

☐ Contact me to arrange a demonstration. ☐ Send me complete information.

Record Keeping Under Scrutiny

The reprieve is over. With the final report of the Privacy Protection Study Commission last week (see story on Page 1), the record keeping practices of the private sector are now going to be coming under ever greater scrutiny.

The report does not call for blanket federal regulation of private-sector record keeping, but rather points to 14 areas where there is a need for new legislation to help safeguard personal privacy.

However, all people involved in private-sector record keeping — particularly users of computerized systems — should be aware of the report's recommendations and its proposals for legislative action.

The new regulations could affect almost every DP shop in existence in one way or the other over the next few years.

All DP managers should become informed about the potential effects on their operations and should be willing to inform their congressmen about parts of the legislation they feel will either be too restrictive or not restrictive enough.

Only with constructive participation from those familiar with DP will Congress be able to sort out the myriad issues raised by the commission's work. The commission did an excellent job, but its recommendations will now be reviewed by Congress and possibly changed.

Your participation in the process is needed.

It's Time for Ifip

The 1977 Congress of the International Federation for Information Processing (Ifip) in Toronto next month (Aug. 8-12) promises a wide-ranging technical program that should be of interest to many people in the computer community.

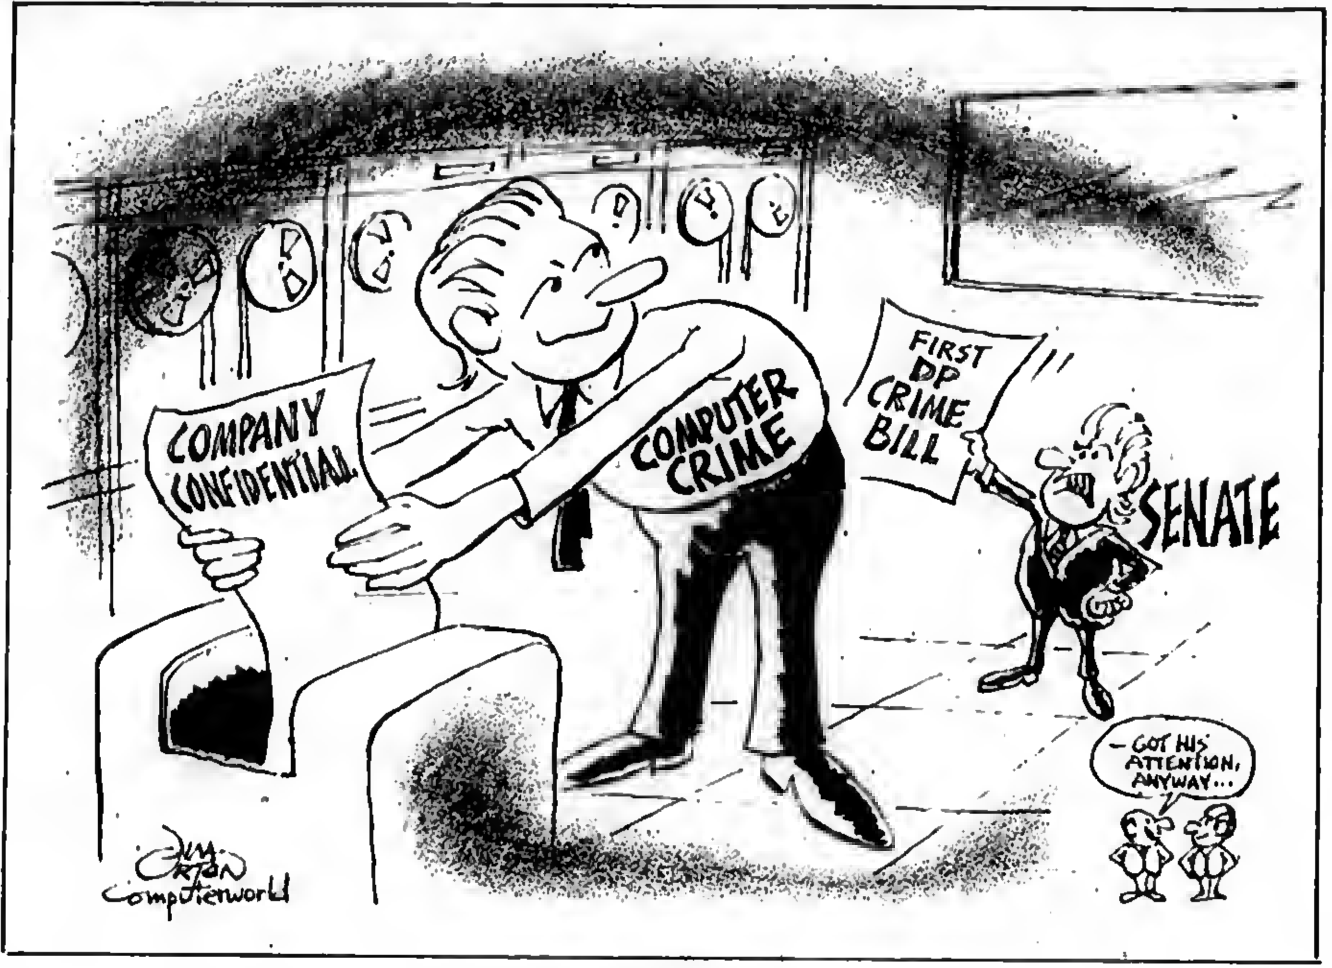
But conferences such as Ifip can only really be successful if they draw a large number of well-informed participants — not only on the dais but also in the audience.

So this is a reminder that there is still time to sign up for the conference program, even though it does carry a rather stiff $145 price tag. Out of the 108 sessions and 30 "mini" symposia there is something for everyone.

What is needed is participation by users, vendors and the assorted other folk that make up the U.S. computer scene.

You can get complete information from the Organizing Committee for Ifip Congress 77, c/o Canadian Information Processing Society, Suite 214, 212 King St. W. Toronto, Ont., Canada M5H 1K5.

These triennial congresses only rarely visit North America (the last was in 1965) so this may be your last chance for years to take part in this most international of all computer conferences.



'Stop, Thief, I Say! . . . '

Letters to the Editor

Reports of Successful NCC Elicit Response: 'For Whom?'

As I read your editorial extolling how smooth and well-run the recent National Computer Conference in Dallas was, it reminded me that it was the most frustrating experience I have ever had in attending a computer convention during my 20-odd years in the field.

You must have received different treatment from that given the average attendee. I heard many complaints, especially about the parking and lack of space at the various technical sessions.

Personally, because of a lack of space, I was able to get into only one of the six sessions on microcomputers I wanted the attend. The Afips (American Federation of Information Processing Societies) people I talked to were not even sympathetic about the situation. Their best answer was: "Yes, isn't the convention a big success?"

My question is: "For whom?"

In addition, the Dallas Convention Center was designed without any consideration for getting a wheelchair from one level to another. Furthermore, none of the guards or information center people could help us or showed any concern.

It was only through the help of some of the center's maintenance personnel and one of the college women passing out literature that we found the freight elevators that allowed us to go from one level to another.

Thanks for your good coverage of the convention, as I have been able to read about several of the sessions I was unable to attend because of the space problem.

System/80 Features Here Now

I don't claim to be an expert on the subject, but if I'm not mistaken, many if not most of the "advanced" features Lecht foresees for the IBM System/80 ["The Waves of Change," CW, July 4] have been in use for some time on such Burroughs systems as the B1700 and B6700.

This makes it all the more frustrating that Burroughs hardware reliability and maintenance are so notoriously inadequate.

ACM Ombudsman Explains Goals

In his column [CW, July 4], Alan Taylor attempts to tell the world what the ACM (Association for Computing Machinery) Ombudsman Program "apparently intends to do." What amazes me is that at no time did he ask me.

The ACM Ombudsman Program exists to resolve difficulties that may arise when people interface with computers. Specifically, our goals are to:

1) Educate the public concerning the computer's real capabilities.

2) Identify and help resolve any generic cause of computer-related problems.

3) Act as a third-party fact-finder.

4) Strive to improve interfaces between individuals and computers.

5) Respond to instances of "blaming the computer."

The program is much more extensive than Taylor imagines. In fact, it has been very successful in:

1) Analyzing computerized election systems in Detroit and Los Angeles.

2) Reporting on EDP schools in Nebraska, New Jersey and southern California.

3) Publishing a report entitled "Privacy, Security and the Information Processing Industry."

4) Studying the Bay Area Rapid Transit System in San Francisco.

In short, the advancing knowledge of computers is becoming understood both inside and outside the ACM.

LOS ANGELES — An investigation into the possibility that fraud could be committed with computerized voting was ordered by the Los Angeles County Board of Supervisors. Critics charged it was possible to rig elections with the system being used, an IBM Votomatic.

'People's Computer Center'

DP Education Program Reaches Inner-City Residents

By **Jack Stone**
Special to Computerworld

It is commonplace these days to read of the marvelous achievements of computer technology in industry, science, commerce and government. And it is normal for one to relate these successes to one's own professional and personal situation. As the members of the DP industry are reasonably well-off economically, socially and culturally, advances in computing are directly coupled with our personal growth and development aspirations.

But there is another segment of our society which has an entirely different viewpoint toward computers. I refer to the citizens of the inner-city segments of American urban communities.

Because of a long history of economic and social deprivation, most of these people view the computing industry as a source of fame, fortune and riches for higher ranking social clases and perceive advances in the technology only as serving to widen the gap between rich and poor. For those few who have made a successful transition from poverty to a decently paying DP job, success came only after intensive competition with better educated people.

In summary, it is difficult to identify those areas where computer technology has been of particular benefit to the poor, except possibly for the prompt and accurate distribution of welfare checks.

Recently, I learned of a movement toward the establishment of a "people's computer center" located in the heart of the inner city, whose goal is to apply computer technology to the solution of some of the social problems in these communities.

In the District of Columbia, Afro-American Datanamics, Inc. provides such a capability. Milton White, board chairman, and Teixeira Nash, executive director, consented to an interview with me.

Q: Can you summarize the major aims of Datanamics?

White: Our motto succinctly characterizes the nature of our work: "technology for community effectiveness." Specifically, we are a nonprofit organization whose purpose is to provide computer technology for the use and benefit of the black community. However, while using the computer in community development, we are also striving to prevent the social abuses and dehumanization that tend to accompany modern technology.

Q: What is the nature of your organization?

Nash: We are a group of social scientists, social artists and social technologists. We view ourselves as a mixture of community people working within the unique and unifying socio-cultural framework provided by Datanamics. We hope that by bringing these three diverse disciplines together at the same computer consoles we will develop greater strength in solving the problems of the black society in America today.

White: You see, the arts of our community have for too long been at odds with the science of our community, even though these were often two approaches to the same goal — making it. The black community gambler and hustler are not far in a technological sense from the mathematician and the Wall Street broker. Datanamics must identify the strengths of these native technologists and apply these strengths for their utilization to community development as well as individual growth.

Q: Dr. White, what is your background and how did you get involved with Datanamics?

White: I am a part of black American society. I strengthened my knowledge of this society when I received my doctorate in political science from the University of California. I have had considerable academic experience at the university level, in both teaching and administrative positions, and am currently an associate professor of political science at Howard University. I helped organize Datanamics three years ago when it became clear to me that the university establishment was not doing enough for deprived people in urban areas.

Q: What are the major services that you render?

Nash: Our primary service is that of computer-based education and training.

The Human Connection

Toward this end, we have installed a Digital Equipment Corp. PDP-11/45 with 96K words of main storage, which is configured with 10 DEC terminals, six teleprinters and four video. The machine system was provided as the result of a grant from DEC, to whom we are deeply grateful.

Through the use of these teaching terminals, we offer courses to advance the basic skills of math and reading, plus courses in DP. The DP courses include machine operations, programming and data entry, and the terminal training sessions are, of course, supplemented by "hands-on" experience. We have programming courses in Cobol, Fortran and Basic.

With our computer capability, we are able to help support and rehabilitate organizations in our community, such as neighborhood employment services; religious groups and economic development projects.

Q: Can you describe your educational software, as it were?

White: We have two general types of terminal-oriented educational programs. We call the first one "computerized learning," in which all instructional material is presented at the terminal. The student works at the terminal on an individualized basis, moving at his own pace.

The second is called "computer-assisted" or "computer-managed" instruction, in which the terminal serves only as a tutor — a "homework coach," if you will. The material in this case is of the drill and practice variety and requires that an experienced instructor be present.

Q: Where do you obtain your educational software?

Nash: Well, we tried very hard to use commercially available packages. However, they don't work well in our environment because our students have difficulty understanding their questions. So we develop our own, using teams of instructors and neighborhood citizens which we call "cultural language committees." We use high school dropouts in the course authoring process to help compensate for the language gap of our staff caused by social and age factors.

I should note that we have had about 200 citizens pass through our terminal training and have more than 1,000 waiting in line. All training is provided at no cost to the student.

Q: And what does the future hold for you?

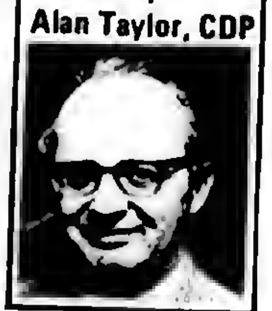
White: I visualize growth in three areas, depending on availability of external funding: extension of instruction into the home to accommodate the inner-city stay-ins, via combined TV and computer technology; computerized community support of health clinics, cultural events and tips on nutrition and energy; and the expansion of our concept into other major cities to create a network of community computer centers to serve more of the economically and socially deprived people of this country.

Additional information may be obtained by writing to Datanamics at 3201 14th St. NW, Washington, D.C. 20010.

Advent of 'Vax'

Large Minis Could Signal End to Huge Price Markups

The Taylor Report
By
Alan Taylor, CDP



The relationship between the manufacturing costs of computers and their selling prices has traditionally been one of very high markups, at least with the traditional "carriage trade" firms. A markup of 500% over cost has not been considered unusual, and 600% or more is not unique, by any means.

Moreover, these prices have been charged for equipment that recovered all its research costs years ago, so the standard excuse that manufacturing costs are only a small part of actual costs really did not hold water. Technology appeared to insulate prices and keep them high.

But now, a new, officially unannounced computer from the minicomputer market seems destined to break the immunity from market economics that has kept maxicomputer prices at such high levels. Called Vax, and scheduled for announcement in October by Digital Equipment Corp., this 32-bit system is priced according to the economics of the mini industry — which has never been able to establish the complete financial control over its products to which maxi marketeers have been accustomed.

Even the initial price for this computer and its successors has to be established recognizing the strength of competition from the mini market and its ability to produce effective hardware at lower prices. So the markups will not be extremely high to start with, and they will come down as time goes on.

Really, what is happening is the beginning of the merger between minis and maxicomputers — with considerable benefits for the current customers of both types of systems.

Through emulation and through language facilities, the minicomputer user will get both the additional power that is often needed and the ability to use his current programs, to match in with traditional 16-bit minis.

The maxicomputer user will get the ability to use a system much like the ones he has grown up with, but at reduced, competitive hardware costs not offered by the traditional maxicomputer market.

Powerful peripheral and communication flexibility in particular will be economically available. In addition, this flexibility can be expected to be enhanced by the ingenuity of the many smaller specialized manufacturers who have already gained considerable understanding of DEC's bus architecture and how to use it to its best advantage.

Maxi Future

What this development will do to the maxi market is anyone's guess. The key point appears to be that the end to users' automatic growth demands seems to be here, and with it the end to automatic renting of larger and larger systems.

Most high-volume applications are already up and running. Despite great progress in theoretical understanding of optimization and transportation algorithms, invoicing and payroll-type applications as opposed to weather-forecasting are what the maxi user sees his computers handling in the next few years.

The maxi user's confidence in his own DP staff's abilities has also grown. The necessity for constant reeducation has dropped off from its Sixties peak, when it seemed that no sooner was an application working than something had made it obsolete.

At that time the carriage-trade maxi manufacturers were really providing their users with something essential in return for the high markups they charged — but that time has long gone.

> *'Really, what is happening is the beginning of the merger between minis and maxicomputers — with considerable benefits for the current customers of both types of systems.'*

Yet, inertia among computer users is high. The maxi manufacturers will certainly be around for a long time to come, although one or two may succumb. There will still be various announcements and plenty of marketing department fireworks.

Software suppliers, who are doing a booming trade and producing some excellent products these days, will still concentrate upon supplying the needs of the maxi market first, as a proving ground for their products.

Progress will be slow on the surface. After all, it is nearly a decade since DEC announced the Decsystem 10 as an entry into the maxi market by a mini manufacturer. But that was always a maxi machine, sold a little bit differently from other manufacturers' large systems.

It was not, and could not be, what the Vax family is going to be. Vax will gradually put to rest the concept that minicomputers are one area where the user can get hardware value, while maxicomputers are another area where the user can't get hardware value, but does get other compensations. In just another decade that concept will be gone.

Vax comes from, and will live in the era when additional logic is cheap and when language packages, operating systems, flexible input/output and applications are much more readily available than was ever anticipated.

Vax will have its successors and competitors which, among them, will provide service as good as that any maxi manufacturer can offer to the average user.

Reader 'Horrified' by Stone

Is Supplying DP Training to Iranian Police Ethical?

Reader Commentary

Dear Mr. Stone:

I read with absolute horror your column of June 20. With all the recent talk of ethics in the computer field, to write an article about training Iranian policemen in computer technology without any consideration of how this technology might be used seems incredible to me.

Are you not aware of the horrors perpetrated by the Iranian police? The tales of torture, suppression of dissent and other acts of official terrorism are almost endless and well documented. Do you not have any qualms about facilitating this brutality?

It seems to me that if our profession is ever to confront the problem of ethics, it should start with the most blatant of abuses — and it appears that this training program could very well constitute such an abuse.

Since I do not know precisely what this training was for and how exactly it will be used, I cannot say for certain that this was a breach of what I would consider professional ethics. However, the possibility exists and I would not have participated in such a program until and unless I was fully satisfied the end result would be benign.

Perhaps the thought that Iranian policement are attaching electrodes to the genitals of an uncooperative peasant who was located by use of a computer system your students helped design does not bother you. Personally, I could not live with that on my conscience.

Let me say that I enjoy your articles and appreciate your usual sensitivity to human issues in computing. This article, however, was such a depature from your norm that I felt compelled to call your attention to it.

I would be pleased if you could devote further articles to the ethics of supplying technology to persons who might misuse it. It is certainly an important but often ignored subject.

Saul I. Tannenbaum

— — —

Dear Mr. Tannenbaum:

The seriousness of your accusations and the ethical issues you raised have led me to ask *Computerworld* to put both your letter and my response in print.

The project you question was originated in March 1975 by the Iranian Police Department as part of a long-range training program to upgrade its computer center personnel, broadening their skills from those relating to a second-generation batch processing operation to those relevant to a fourth-generation distributed processing environment.

The Iranian Police Department had hopes of using U.S. systems development firms to construct and implement national police systems. In anticipating of this, it wanted selected members of its staff to gain a working knowledge of American computing and police management systems.

I believe the Iranian government approached Languge House of Chicago and the Public Management Systems (PMS) division of Planning Research Corp. (PRC) of McLean, Va., to handle the English language upgrade and technology segments of the programs, respectively.

I have been an entrepeneur for 10 years and owner/managing director of my own education consultancy firm for nearly five years. I believe I conduct my business at the highest level of ethical standards present in the computing industry.

Further, though the industry has been very good to me, I feel I have given much to it through the courses I have taught, lectures at public forums, papers at professional societies and my column in *Computerworld*.

With that in mind, it should be easy to see why I took this assignment. First, I was asked to do it by PMS, which sought me after receiving a recommendation from a sister division for whom my colleagues and I had worked over an 18-month period. PMS/PRC is a big company, listed on the New York Stock Exchange; it could have gone anywhere in the world to obtain a training subcontractor, but it came to me.

I had a very strong business obligation because PRC is a major customer of mine and it needed my help in solving a very, very difficult training problem.

Second, all of the training performed by my organization is aimed at building the skills, attitude and motivation of DP managers and technical personnel to do a better job. We do not design or construct systems for customers.

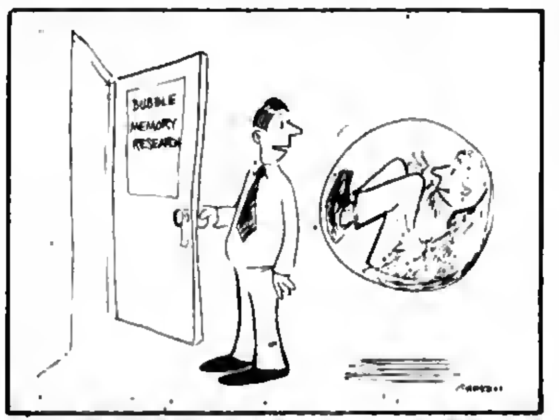
As a citizen of the U.S. I strongly deplore the suppression of human rights anywhere in the world, including our own country, and I completely endorse President Carter's policy in this regard. But how do I deal with the allegations or even documentation of such violations of basic human rights in other countries?

Do I become a committee of one and reject my students and turn aside my customer and, in another dimension, discard the policy of friendship with the Iranian government, which is the established policy of the U.S.?

No, I don't believe my actions were a violation of professional ethics. Instead, I would have felt I had violated the trust my customer placed in me and would have ignored the established foreign policy of our country were I to have rejected the project.

Jack Stone

Tannenbaum is a programmer in Boston, Mass. Stone is president of Computer Education International in Washington, D.C., and a regular contributor to CW.



'I'll Call the Boss, Jack . . . You May Be Onto Something . . .'

"Funny, it doesn't look like an IBM."

Naturally. You're looking at Interdata* hardware while you're executing IBM* software. And it's all very reminiscent of the 370, thanks to the Kardios Systems Corporation.

The new DUO 70™ has more to offer than a mind of its own. Interdata's 7/32, a multi-tasking processer, will now concurrently execute both IBM and Interdata applications programs with performance comparable to the 370-145 system.

The new DUO 70 is going places. With Interdata's maintenance, and with software support from IBM, Interdata and Kardios, the system is a solid performer with unlimited application possibilities.

The new DUO 70 won't keep you waiting. For 7/32's already in place, a field upgrade package with one day installation is available. A brand new system will be delivered on 60 days notice.

*IBM and Interdata are registered trademarks of the International Business Machines Corporation and the Interdata Corporation, respectively.

The new DUO 70 doesn't cost like an IBM. It's available at 1/10th the comparable cost.

And there's nothing funny about that.

(If you can't wait to know more about the new DUO 70, please call Kardios collect: 301-542-6826.)

THE KARDIOS SYSTEMS CORPORATION
3820 Courtleigh Drive
Randallstown, Maryland 21133

I'd like to know more about the new DUO 70.

Reading Mail Pays Off

Package Leads to Simpler Coding of CICS Programs

By Don Leavitt
Of the CW Staff

SAN FRANCISCO — Every once in a while, the flow of sales literature that passes over a DP manager's desk leads to something really worthwhile. That at least is the experience of a manager for an air freight forwarding firm based here.

Novo Air Freight has both domestic and international operations. The data center here, based on a 256K IBM 370/135 and a 512K 370/145 under DOS/VS, handles all accounting and shipment information for the corporation, according to Al Patrizio, director of management information systems.

The 145 supports all the teleprocessing for the firm including 40 local terminals and 110 more "spread from Alaska to Florida to New York to California," Patrizio said. The network is used for inquiry and data entry applications for a CICS/VS-driven data base residing on multiple spindles of 3340 and other disk space.

The programming staff, split into teleprocessing and batch groups, amounts to seven people with another slated to come aboard shortly. It is, in Patrizio's view, a limited but extremely talented staff.

Not long ago, Patrizio received a brochure describing a package from Oxford Software Corp. The full name of the package is User Files Online, but Oxford stressed the shorter name UFO in its brochure, and Patrizio admitted he was intrigued by the name and the artwork.

Beyond that, he "had to read it because of the application we were addressing at the time," an international shipment system. Classified as a display management system for CICS, UFO seemed to offer a way to avoid excess programming, he added.

Patrizio sent for more information but never built a formalized rating scheme to see how well UFO compared with other packages. He looked at one IBM offering, but that was "a batch-oriented thing," no comparison to UFO's on-line support. The initial UFO packaging was "rather limited," he said. However, Oxford added procedural language support and that "tremendously enhanced" the system so Novo acquired it.

The vendor offered two ways of installing the package: remotely, in which the user does all the work, or with support including a stand-up trainer. "We chose the latter path. I wanted to make sure we understood how it worked. If there were any problems, we'd settle them right away," he explained.

Pleased With Training

Patrizio was pleased with Oxford's approach in the training class. "We tried to get help with our priority application, but Oxford told us to do it our way: training wasn't supposed to be programming class."

The manager had all of his staff sit in on the training sessions and that had an unexpected benefit. Having been introduced to the teleprocessing environment and an easy way to work with it, Novo's batch-oriented staffers "suddenly realized they didn't need 10 years experience to do well in it."

The batch programmers were familiar with CRTs and they continue to write batch programs, "but they have the feeling they can cope with TP if the need or the opportunity arises." They'd been using source statement maintenance from IBM on the terminals, but now they were picking up the attributes of the 3270.

Even though the teleprocessing application program end-product looks very complicated, they could see it was really quite simple, Patrizio continued.

Anything as simple to use as UFO "has to have overhead," he admitted. The software is a dictionary-driven system and in a test comparing the speed of copying data from Isam files and from UFO files, UFO "came in about two seconds slower" but for Novo's purposes that "isn't all that big a deal."

In any case, UFO code is supporting customer inquiries at two customer locations where it is satisfying an immediate need and doing it well, according to Patrizio.

The manager semed to like the speed with which UFO can be used as much as any of the special capabilities it offers. He said his staff uses the package to develop ideas during application design time.

The center is a service unit for three or four subsidiaries of the Novo Corp. When these "customers" say they want something but then change their minds "it's not a disaster" to rearrange data elements with UFO, Patrizio said.

'Jobdoc' Tracks TSO Jobs, Run Books

HOUSTON — The Job Documentation System (Jobdoc) from Gulf Computer Sciences, Inc. is described as a series of programs operating under IBM's OS/360 or OS/VS for the centralization and control of computer jobs and documentation.

The system, which gains its on-line capabilities through an interface to IBM's Time-Sharing Option (TSO), keeps operators posted on what a job or program can do, what input is needed for it, how the work is run and what information can be obtained from it, according to a Gulf spokesman.

The software provides standardization and centralization, with all information available to authorized personnel at any specified location and with on-line instructions for obtaining it. A synopsis of all assembled data for each job contained in the system is also available, he added.

On-line inquiry and update facilities eliminate cards and card-handling operations on each job. On-line data entry and editing of stored documentation also eliminates the need for a run book, he continued.

By automating the documentation, the system frees the programmer from both the initial preparation and the equally important, and often equally burdensome, need to update the documentation, the spokesman claimed.

The instructions provided by Jobdoc include assistance to the job setup and control clerk on the one hand and help to cope with Abend/Restart situations on the other.

The system also includes systematic control for disaster planning including identification of critical jobs and their degree of criticality as defined by the user. Part of the disaster support includes creation of a special portable data base to get work started, if required, in a new location.

The package includes Cobol and ALC modules in source form for compilation and input to IBM's IEBUPDTE routine; reader-interpreter and analysis modules in object form; and manuals describing the system.

Organizations willing to serve as demonstration points for Jobdoc can have the product installed for a one-time cost of $17,000. As of Sept. 1, the cost will go up to $21,500, the Gulf spokesman said from 1775 St. James Place, Suite 160, Houston, Texas 77056.

'Blis/Cobol' Interfaces Trident Disks, Novas

WINTER PARK, Fla. — The Blis/Cobol operating system has been enhanced to support Trident disk systems as well as other peripherals attached to Data General Corp. Nova and Eclipse systems, according to the Blis vendor, Information Processing, Inc. (IPI).

Among the Trident units supported in this upgrade are the T-25, T-50, T-80, T-200 and T-300. With them in place, Blis/Cobol users can work with indexed files containing up to 16 million records, with 500M bytes each, spanning eight drives, IPI claimed.

The software enables users to retrieve data from the files sequentially, randomly or by alphabetic keys. Working from the ANS Cobol-74 compiler that makes up the system's backbone, users can access records by four different alphabetic keys, the spokesman stated.

While Blis/Cobol provides the software interface between the Trident disks and the DG minicomputers, the hardware linkage is provided by Minicomputer Technology 802A controllers.

The multiuser Blis/Cobol operating system includes record-level lockouts to avoid simultaneous updates. Indexes are maintained dynamically to avoid the need for periodic file reorganizations, the company noted.

The stand-alone software system can be used on DG computers with 16K words, but 32K words is a better environment for it, the spokesman said. Blis/Cobol costs $4,000, he added from Suite 320, 1850 Lee Road, Winter Park, Fla.32789.

Correction

NEW YORK — Copies of the June 1977 issue of the *SigCSE Bulletin*, cited in "ACM Programmer Curriculum Sets College Guidelines" [CW, June 27], are available for $2 each, according to the Association for Computing Machinery (ACM), 1133 Avenue of the Americas, New York, N.Y. 10036.

IF YOU'RE MAKING FINANCIAL DECISIONS WITHOUT TIMELY INFORMATION, YOU NEED THE MMS GENERAL LEDGER.

When your financial management makes decisions without accurate, timely information, they might as well be blindfolded.

But you can give your decision-makers *all* the information they need, in any format they feel comfortable with, and deliver with fast-ball speed.

All you need is the MMS GENERAL LEDGER. The proven financial reporting system, it's scoring an impressive record in more than 800 major corporations around the globe.

A data-base system, MMS GENERAL LEDGER knows how to handle all the league-leaders, including DOS, O/S, IMS, IDMS, DL/1 and TOTAL.

If your requirements need a heavy-hitter, the MMS GENERAL LEDGER is available with an additional *ON-LINE MODULE* that makes financial reporting a whole new ball game.

Best of all, MMS GENERAL LEDGER is only one member of Software International's all-star team, which features Accounts Receivable, Accounts Payable, Net Change MRP, Filetab Report Writer and three for Systems/3 — General Ledger, Accounts Payable and Accounts Receivable.

When the pressure is on and you can't afford mistakes, call or write Software International. Get the champion performer, MMS GENERAL LEDGER.

Take me out to a whole new ball game of financial reporting. Please send me more information about:

ABEND AGAIN?

A lot of abends occur due to lack of disk work space. Programmer overallocation, Format 5 errors, and uncompressed PDSs all take up space that is difficult to trace and impossible to use . . . unless you have the Pansophic software solution, PAN*DA.

PAN*DA is the automatic DASD management system. It reports by volume, user, or track to graphically show the location of all data sets. Comments on each report flag potential problem areas, obsolete data sets or wasted space. PAN*DA then acts upon the DASD population to return unused space to the system: Dynamic Space Allocation releases overallocated space; automatic Scratch deletes unauthorized or unwanted data sets; automatic PDS Compression saves effort and creates free space; and Format 5 error space is reclaimed automatically.

PAN*DA is the only disk management utility under OS with so many automatic features, and the only one that identifies VSAM data areas. End surprise abends with PAN*DA.

Pansophic is the leading systems software company dedicated to solving your software problems. Call or write today for further information on our complete line of proven software products.

Survey Flaws Seem Obvious. . . But Challenges Have Flaws Too

By Sam Levine
Special to Computerworld

In "New Ideas Sought to Bring Order to Package Surveys" [CW, Apr. 4] Don Leavitt raised pertinent questions concerning the value of the Datapro Honor Roll. He said the statistical sample used in rating the packages is too small and the honor roll only benefits those vendors "elected" to it. I agree on both counts.

One factor the article didn't address is the validity of the questions used to rate the packages. Specifically, Datapro's seven questions deal with overall satisfaction, throughput/efficiency, ease of installation, ease of use, documentation, vendor training and vendor technical support.

The respondee is asked to assign a weighted value to each question based on a 4.0 perfect scale — just like college grades. Unlike college grades, however, the scores are not based on an accurate measure, but rather on the opinion of the person answering the questionnaire.

There is no guarantee that person is the primary user of the package; consequently, he may not be in a position to accurately grade it. In addition, since the "grades" are purely subjective, I dare say they'd vary greatly depending on the mental frame of the person when he is answering the questionnaire.

The Datapro questions themselves are also ambiguous. What does "overall satisfaction" mean? Can a user really judge "throughput/efficiency" without accurately measuring it?

"Ease of installation" also puzzles me. Just about every vendor I've talked to will install the package (IBM is a large exception). So why would anyone care about how easy or hard it is to put the package on the computer? If Datapro means "ease of installation" to be a measure of machine time to install the package or program modification effort, it should say so.

The remaining four questions — ease of use, documentation, vendor technical support and vendor training — are equally ambiguous and misleading. Shops might have greatly different opinions concerning how easy a package is to use, how clear the documentation is or how good the vendor training was depending on the quality of the user's staff. As for technical support, well, vendors are only as good as their last performance.

Levine is a consultant in New York.

By Don Leavitt
Of the CW Staff

In fairness to the work Datapro puts into gathering its user ratings of proprietary software, I think Levine deserves a response.

Contrary to his understanding, for example, I have no gripe with the size of the statistical sample the researchers use. They send questionnaires by first class mail to 30,000 individuals drawn from a list indicating they have a substantial interest in DP. Even if half these recipients are not from using organizations, the base itself seems adequate.

I am concerned, however, about the minimal number of ratings they accept as a basis for possible inclusion on the Software Honor Roll. With the wide distribution of packages today, it is wrong to let as few as half a dozen raters "make or break" a package.

Happily, most of the 1976 "winners" had many times the minimum number of good ratings to qualify. Yet precisely that fact should encourage Datapro to boost its requirement in this respect.

DP Community Benefits

Incidentally, vendors "elected" to the honor roll are not the only beneficiaries. The whole DP community gains if the vendors compete — through enhancements, not handholding — to make sure their products show up well on such an open forum.

On the details of the rating scheme, Levine is right — they are subjective. If there were some accurate and objective measures, there'd be no need to check user experience. The basic problem, I think, is that installations and what they try to do with packages vary widely, and standard measures just don't apply.

But by gathering and averaging a good number of individual, admittedly subjective ratings, I think Datapro can come up with reasonably valid ratings on how well a product measures up in a typical (whatever that means) situation.

The real problem, and one that Levine recognizes too, is that Datapro has no control over who actually answers the questionnaire. I'd like to see a good solution to that one.

I agree the questions are ambiguous, but for the same reason the ratings are subjective: we have no fixed metrics applicable to software. Despite possible disagreement over detailed meanings of any term, however, most of us can appreciate the basic meaning of the final scores.

Because they are averaged, they probably reflect how well a package does in a typical situation. And it probably is reasonable to compare ratings of competing packages to see which seem worth evaluating in depth.

Any survey that can help users that much has to be a welcome addition to the community.

Card Readers Tied To MDS Series 1200

PARSIPPANY, N.Y. — Mohawk Data Sciences Corp. (MDS) has enhanced its System 1200 data entry/communications software to support the use of card readers as well as keyboards for input operations.

The changes have been included in both the stand-alone Key-Display Operating System (KDOS) for data entry and the "Concurrent" version, which allows communications functions to proceed at the same time, according to a spokesman.

The upgrade lets users move data from a card reader directly to the system's disk file, eliminating tape transfer operations, or directly to a communications line to a host mainframe, he explained.

With the enhanced software in place, the user can attach either a Mohawk Model 2453, which has a top speed of 400 card/min, or the 2455, which can operate at 1,000 card/min, he added.

Communications with the mainframe is handled under IBM's 2780 or 3780 protocol. System 1200 also allows users to transmit data from disk or tape under those protocols or under 2968 protocol and to receive data on tapes, disks or printers.

MDS is at 1599 Littleton Road, Parsippany, N.J. 07054.

XCS Offers Price Break On Distributor Service

EL SEGUNDO, Calif.— Xerox Computer Services (XCS) has reduced prices approximately 10% on the Xerox 1-2-3 System, an on-line service for wholesale distributors. Cost of the service can be as low as $750/mo, according to a spokesman.

The 1-2-3 System provides integrated order processing, inventory control, accounts receivable and sales analysis applications for distributors with annual sales as low as $500,000, he explained.

The $750/mo figure is a minimum charge for use of the system but seems to apply to many of the users on this "start-up" service, he added.

XCS provides remote computing network facilities throughout much of the country and is headquartered here at 701 South Aviation Blvd., El Segundo, Calif. 90245.

THE NEW METHODOLOGY:

"SDM/70 helped us increase staff effectiveness 40 to 50%; it's everything you say it is."

—Norman Scott, *Manager, Technical Support Services, Data Processing Department, City of Detroit*

In Norman Scott's opinion; front-end user involvement is a major benefit of SDM/70; he reports, "We have been getting true user involvement since we installed SDM/70."

What is SDM/70? It's a comprehensive set of guidelines that steers a project team through the design of systems. SDM/70 covers all of the system life cycle phases, from initiation through the implementation phase and, for operational applications, including guidelines for post-implementation review and for maintenance-related work.

The SDM/70 structure includes five components: Methods guidelines that describe how each task of a given phase is to be performed; documentation guidelines that describe how to prepare the documentation for a given phase; forms guidelines that describe how to complete the SDM/70 forms; estimating guidelines that describe how to estimate costs and schedules for the project (5 to 10% accuracy is now a reality), and administrative guidelines that describe how to administer and control project activities.

To find out how SDM/70 can help you, call or write today.

Progress Report:

370/145 USERS: HERE ARE TWO NEW CAMBRIDGE OPTIONS NO ONE ELSE GIVES YOU.

OPTION #1: GET YOUR NEW 148 MEMORY NOW– BEFORE YOU GET YOUR 148.

If you are waiting for a 148 CPU, you don't have to wait for the memory. Buy a Cambridge 370/STOR 145 now–and you get a 148 interface conversion capability built in. The day your 148 arrives, you unplug our memory from the 145, plug it into the 148 in less than a shift, and start to work–at a savings of more than 50% of what IBM charges.

OPTION #2: GET MORE 145 MEMORY NOW– FOR ONLY 90 DAYS– AT 50% LESS.

If you want to wait until you get your 148, don't go without the memory capacity you need right now. Cambridge is offering a 90-day rental plan on 370/STOR 145 memory*. You can add up to two megs today, keep it for as little as three months or as long as you want, and still save 50%. Not only that, but Cambridge will do something else for you that no other supplier does: we'll guarantee delivery in just two weeks.

*Offer applies only to Cambridge equipment currently available, not including 148 interface conversion features.

These two options are typical of what our 700 users expect from Cambridge, and why one out of every 12 370/145 systems uses Cambridge memory. Here's what else you will get with every 370/STOR 145 memory:

- 2K static MOS or 1K bipolar storage devices, just like the ones IBM uses. Static means safety, simplicity and assured compatibility with IBM memory techniques. No one else has it.
- Maximum failure protection. Cambridge gives you a memory exerciser for off-line, worst case testing; a maintenance panel for elimination of single-bit errors and fast fault isolation; and a reconfiguration switch that lets you dial out trouble in 128K increments. No one else has all three.
- Console file transparency. With Cambridge 145 memory, you *never* tamper with your console file routines. 370/STOR 145 has no effect on them, regardless of the capacity. No one else has it.
- The third port. It means that any 145 Mod I or Mod II can be upgraded–in any size increment, on top of any resident memory–up to a full two megabytes. The ultimate flexibility and economy. Only Cambridge has it.

Find out more about 370/STOR memory. Send us the coupon, or call us on the OptionPhone: 617-271-6400.

Data Briefs

Metric Publication Lists Test Equipment

BURLINGAME, Calif. — Metric Resources Corp. has published an eight-page brochure covering rental and lease of telecommunications and electronics test equipment.

The brochure lists more than 400 model numbers, descriptions and monthly rental rates of test sets for data communications, computer/protocol, carrier, cable fault locating, microwave, mobile communications and video equipment, according to the firm.

A separate section presents a brief economic analysis of the user's "rent vs. buy decision," illustrated with a graph of effective monthly equipment expenses.

The brochure offers a convenient listing of equipment available, but does not offer in-depth product descriptions.

Metric Resources is located at 822 Airport Blvd., Burlingame, Calif. 94010.

Lear Cuts ADM-3 Price

ANAHEIM, Calif. — The Data Products Group of Lear Siegler's Electronic Instrumentation Division has dropped the price of ADM-3 Dumb Terminal $100 and included a once-optional feature in the lower cost.

The base price is now $895. In addition, the 24-line, 1,920-char. display capability, formerly an option at $250, has become a standard item, according to the firm.

TCTS Expands Service

OTTAWA, Ont. — Four serving areas have been added to The Dataroute, the digital data network provided by The Computer Communications Group of the TransCanada Telephone System (TCTS).

The addition of Brantford, Chatham and St. Catharines in Ontario and Charlottetown in Prince Edward Island on July 1 brought the number of Dataroute serving areas to 36.

For Business Users

Datacom Inaugurates Usage-Sensitive Net

By John P. Hebert
Of the CW Staff

MEMPHIS, Tenn.— The Datacom Co. based here is offering a usage-sensitive data communications network alternative for business users which reportedly can interface any terminal protocol.

The nonprofit wholly-owned subsidiary of Data Communications Corp. (DCC) here operates a nonregulated national packet-switched network service which converts users' terminal-to-CPU data communications into a standard speed and code format. The service utilizes microprocessor-based communications controllers developed by Datacom and Universal Data Systems, Inc., according to a Datacom spokesman.

Any users opting for the full-duplex transmission network service can save money compared to the costs of using any other carriers' network, he claimed.

The network uses leased, unconditioned voice-grade lines from AT&T to transmit users' data at 4,800 bit/sec, he said.

Because the network was originally developed for — and is still shared by — users of the parent company's Broadcast Industry Automation System (Bias), business users are given a discount on data transmitted between the hours of 8 p.m. and 6 a.m. the following morning, according to the spokesman.

Datacom transmits users' data in 132-character packets. Subscribers are charged to transmit kilopackets of data anywhere in the continental U.S. at a rate of $1.70 per kilopacket during the daytime hours (between 6 a.m. and 8 p.m.) and $.85/kilopacket at night, he said.

Users, however, are not restricted as to when they are able to access and use the network facilities, the spokesman explained.

To access the network, users must either buy or rent a microprocessor "black box" from Datacom for $2,000 or about $100/mo on a one-year lease, he said.

Procuring a line interface between the users' terminal or CPU and the network nodes in 85 U.S. cities is up to the user and is not an extra network cost, according to the spokesman.

The company guarantees users their buffers will arrive at destination; and the network also offers other features, he said.

Datacom may upgrade the network to operate at speeds above 4,800 bit/sec if there is a need, he said, adding the company is looking into the possibility of changing from voice-grade lines to Bell's Dataphone Digital Service digital line offering.

The Datacom Co. is located at 3000 Directors Row, Executive Plaza, Memphis, Tenn. 38131.

For January Operation

ITT Readies Shared User Network

By John P. Hebert
Of the CW Staff

NEW YORK — ITT Corporate Communications Services, Inc. (ITT-CCS) late last month received approval from the Federal Communications Commission (FCC) for an interstate common carrier service for primarily voice but also business data communications users.

In addition, CCS has already installed the first and largest of its planned nationwide computerized telephone and data switching centers here for what it calls the Switched Private Network Service (SPNS).

CCS filed with the FCC in May 1976 for SPNS, which is aimed at low- to medium-sized users.

Its Corporate Communications Switching Equipment (CCSE) offering for large-volume users did not require FCC approval [May 31, 1976].

The company expects to launch the two services by Jan. 1, according to a CCS spokesman.

SPNS will provide four-wire switched private line facilities on a dedicated subscriber-to-subscriber basis utilizing ITT-CCS switches and shared-user, leased transmission lines between cities, the company stated.

Since the SPNS network lines are leased from other carriers, CCS will guarantee 4,800 bit/sec transmission for data users, the spokesman noted.

SPNS features will include privacy, detailed per-call billing, traffic statistics, desk-to-desk dialing, abbreviated dialing, hotline service, conference calls and project billing for specific subbilling accounts, according to CCS.

Voice-grade telecommunications services will be provided through the SPNS network switching-center and tariff-extension cities, which will include Atlanta, Baltimore, Boston, Chicago, Dallas, Los Angeles, Milwaukee, New York, Philadelphia, San Diego, San Francisco and Washington, D.C., according to a CCS spokesman.

ITT's seven proposed switching centers in the system are designed to provide users with network management controls of line and trunk equipment on a real-time basis, he said.

CCS anticipates filing rates with the FCC for

(Continued on Page 25)

'Calrs' Diagnoses Phone Faults

HAMILTON, Ont. — A service operator for Bell Canada here responds to telephone subscriber trouble calls by using a Westinghouse Canada Ltd. W1600 CRT terminal to input the subscriber's telephone number into Bell's Centralized Automated Loop Reporting System (Calrs).

Calrs is designed to reduce to minutes the time required to diagnose and take corrective procedures on customer telephone or telephone line problems.

Mini Technology

The system uses minicomputer technology to store and retrieve information and to perform up to 15 measurements plus operating checks to diagnose faults in customer equipment, according to Westinghouse.

The operator of the computer terminal asks a series of questions and then types the subscriber's answers into the system, which diagnoses the problem. More complicated problems are transferred from the operator's terminal to a senior repair technician for analysis and solution, Westinghouse said.

CLIP AND RETURN FOR FAST RESPONSE

ComData

☐ Series 200 frequency division multiplexer

Data rates: Mixture of asynchronous channels up to 300 baud
Channels: Maximum of 18 channels
Diagnostics: Remote and local loopback, test, busy-out, indicators
Multi-drop: Drop one or more channels at a number of locations
Multiple access: Multi-drop channels have equal opportunity for processor channel
Line: Dial or dedicated
Options: Voice-plus-data, data regeneration

$465 basic unit
$325 channel end

codex

☐ Series 900 time division multiplexer

Data rates: Mixture of synchronous or asynchronous up to the high speed modem aggregate
Channels: Up to 64 channels
Diagnostics: Remote and local loopback, busy-out
Line conditioning: C2 conditioning recommended
Options: Auto speed detection, multi-drop

$1283 base unit
$152 async channel end

Computer Professionals...

Your career is 1/3. Your life is 2/3.

You'll all like NCR-Wichita.

We provide a state-of-the-art challenge in realtime architecture, develop network design and communication control for distributive processing in a revolutionary data processing minicomputer environment. Here you are given the chance to create and are treated as the unique individual you are. In our metropolitan location, the old west hospitality still prevails. In the midst of modern shopping centers, great restaurants, theatre groups, 52 parks, a solid school system and an opportunity for continuing education at three state universities. You can see the night sky like you have never seen it before and if you like outdoor sports, you will find this location gets your muscles working up to par. The people are friendly, the air clean, the water pure and there is plenty for all. Some of our opportunities are:

COMPILER DESIGN PROGRAMMERS

Serve as a team member for design development documentation testing and enhancing of large compilers.

MINICOMPUTER OPERATING SYSTEMS

Responsible as a team member for design, implementation and testing of interactive general purpose operating systems to support COBOL applications and utilities, written and assembly language.

DIAGNOSTIC DESIGN & PROGRAMMERS

Design, modification and support of diagnostic programs to provide for testing on new mini/micro processor based hardware systems.

WE'RE WORTH AN EXTRA-SPECIAL LOOK

Firms Set Sights on Competing With IBM High-Capacity CRTs

By John P. Hebert
Of the CW Staff

DALLAS — Shortly after IBM announced a 3,440-character-capacity screen for some 3270 series CRT terminals, Four-Phase Systems, Inc. and Harris Corp. tested their competitive reflexes and met the mainframer's challenge.

At last month's National Computer Conference here, Four-Phase demonstrated an operational IBM 3270-compatihle CRT with the 43-line by 80-char./line display format. The terminal was operating as part of a live demonstration of the company's stand-alone System IV/70 operating with IBM 3270 simulation software, according to a company spokesman.

Four-Phase was demonstrating the large-capacity CRT solely as a competitive response to IBM's announced intentions. The terminal does not yet have a model name, price or delivery schedule, the spokesman stated.

The company also did not research the advantages or disadvantages to users of the 3,440-character display, the spokesman admitted. He said it did, however, alter the necessary electronics in the terminal within two weeks after IBM announced the model 3276 and 3278 additions to the 3270 CRT family [CW, May 23].

Harris also announced a large-capacity 3270-compatible CRT terminal, but did not show its engineering prototype to NCC attendees.

IBM's 3276 and 3278, however, have not been shown or demonstrated publicly. The terminals will not be available until well into 1978, according to IBM.

According to the Four-Phase spokesman, his company has no obligation to manufacture or deliver such a terminal to users until IBM does so.

The major reason for producing 3,440-character terminals, an industry source pointed out, is to display the contents of one standard typewritten, single-spaced page on the CRT screen.

For as little as $770 you can own our Video 100.

- Standard display capacity: 24 lines, 1920 characters.
- Addressable cursor for easy formatting.
- Host computer can lock the Video 100's keyboard and clear the screen remotely.
- Equipped for 103 or 202 type modem operation.

Our Video 100 is available at a very affordable price. Depending on the quantity you order, the cost can be as low as $770.

The Video 100 is perfect for in-house timesharing and remote inquiry applications. An optional full service maintenance contract is available for $20 per month.

For more details, call Joe Steele at 800-631-7050.

the SPNS services late this month or in early August, the spokesman said.

"Typical rates which might be expected" were filed with the FCC last year with the SPNS application, but the "whole world of communications has changed since that time," he pointed out.

Basically, SPNS users can expect to pay a monthly service charge, a one-time installation charge and a user charge varying with distance of network services, in addition to supplying their own modems, according to the spokesman.

Last year, the proposed, tentative charges filed with the application to the FCC showed a local access charge of $30/mo per channel with an $85 one-time installation charge. Usage charge per port was expected to be a minimum of $120/mo.

Beyond the minimum rates, the 1976 CCS application referred to eight categories based on distance and time SPNS is used ranging from 3 cent/min from one to 400 miles up to 39 cent/min at distances over 2,500 miles [CW, May 31, 1976].

These charges, however, could he much higher or lower than rates SPNS users will he charged when the network is operational, the spokesman cautioned.

The company's second offering, CCSE, will provide the user only with access to the high-volume-capacity switching equipment.

It will require that a large user contract for the use of a minimum number of ports; hilling will be based on a monthly per-port charge plus a one-ime installation charge for each port used, CCS said.

In 1976, the minimum number of ports was expected to be 96, the installation fee $60/port and the monthly charge was $120/mo port [CW, May 31, 1976].

CCSE will allow large telecommunications users to custom-design their own network using the ITT-CCS switching equipment in conjunction with transmission facilities they own or lease from any other common carrier.

CCS is located at One Whitehall St., New York, N.Y.

Pacer 103 Gets Interface

RIDGEFIELD, Conn.— Digitech Data Industries, Inc. has announced an interface option which reportedly allows their Pacer Model 103 data line monitor and simulator to operate on 50 kbit/sec circuits.

The interface consists of two adapters which connect to the modem and terminal side of the line, the company said.

The pair of adapters costs $995, Digitech said from 66 Grove St., Ridgefield, Conn. 06877.

When less computer equals more performance, small really is beautiful.

A special report on *Minicomputers and Small Systems* in the August 29th *Computerworld*.

Minis are now functioning at every level of business and industry, and *Computerworld's* August 29th special report, edited by Esther Surden, will focus on several issues that are currently the subject of widespread discussion and debate in the minicomputer field. We'll also cover minicomputer hardware in depth — including microcomputers being used in data processing systems. In all, you'll see a variety of applications stories and tutorials on topics like these:

- Programming languages for small business systems — commentary on languages that have the same name but because of the "improvements" added by competing vendors, may have wide variences in operating efficiency.
- How to evaluate technical evaluations — a look at what benchmark tests and product specifications mean.
- The evaluation and selection process — a case study.
- Minicomputer maintenance — analysis of possible methods (vendor maintenance, independent service organizations, and end user self-support) with an eye to cost savings.
- Minicomputers in distributed processing — stand alone and communicating.
- Using minicomputer equipment — including general purpose minis, small business systems, turnkey systems, miniperipherals and microcomputers.

If you're interested in finding new ways to make data processing more useful and cost effective throughout your organization, you should read our special report in August 29th issue And if you're a mini manufacturer, OEM or systems house who's interested in telling potential customers how your equipment can help them in their jobs — advertise here. Your *Computerworld* salesman can give you complete details. But don't miss the August 12th ad closing date. Call Terry Williams at (617) 965-5800 to reserve space for your ad.

Storage Capacity Up 75%

Arkansas 'Promoting Deflation' With Disk Upgrade

LITTLE ROCK, Ark. — "It's ironic; we're actually promoting deflation," according to James T. Randolph, director of Arkansas' department of computer services. Randolph was discussing the state's disk storage equipment.

With the installation of Memorex Corp. 200M-byte disk drives to replace the previous 100M-byte drives supplied by IBM with the state's two 370 CPUs, storage capacity of the disk subsystems has been increased by 75%, while floor space requirements have been reduced by over 50%, Randolph said.

At the same time, the state is able to charge all of its agencies 5% less for central DP services, he said, noting that with the expanded capacity, tasks such as a new sales tax application can now be added to the system.

A detailed 30-day study by an evaluation team of computer technicians ultimately led to the decision to award a contract to Memorex for its Model 3675 200M-byte disk storage drives, according to Randolph. In response to the state's request for proposal to four vendors, three responded as willing to undergo evaluation tests in accordance with the 95% availability requirements then set by the state department of computer services, he said.

Limiting Factors

Managers at the state's DP facility had several constraining factors affecting the decision to upgrade the disk subsystem, including limited floor space and an air conditioning system already at its peak, Hall explained. In addition, the new equipment had to meet the 95% availability criterion, allowing only 5% downtime for all maintenance, including preventive maintenance, over the 30-day test period.

In more recent months, the state has increased the availability requirement for all of its DP production equipment to 98%, a requirement the disk subsystem has also met successfully, according to a Memorex spokesman.

The state's disk storage subsystem, which is shared between a 370/158 and a 370/145, both of which operate under Release 6 of OS/VS-1, consists of four strings of Memorex 3675 disk drives and 3673 controllers. Interfacing between the Memorex strings and the IBM processors is accomplished through a pair of Memorex 3672 storage control units.

Total capacity of the 28-spindle subsystem is 5.6 billion bytes. The predecessor disk subsystem, consisting of 32 IBM 100M-byte disk drives, had a capacity of 3.2 billion bytes. Air conditioning requirements for the Memorex equipment remain about the same as for the replaced drives, Hall indicated.

The Memorex drives were introduced to the facility gradually, according to Hall. At first, one string of eight spindles were installed, and at two-week intervals the remaining three strings were added. The four 3673 disk controllers are connected to the two 3672 storage control units. All of the drives are switchable between both CPUs for maximum system reliability, he said.

"We can perform string switching between CPU channels and switch control units as well," Hall explained. "That is, if one controller develops problems, the other one is switched to carry more of the load. This capability ensures that we never lose an entire portion of the disk subsystem. Each 3672 has the capability to read all units in the subsystem."

The emphasis on reliability and backup has been maintained largely because the system serves the state's Criminal Justice and Highway Safety Information Network. This network operates 49 terminals located at state and local police departments and at the state's Criminal Justice Division, and it connects to the National Crime Informa-

Long-Range DP Planning Seen Business Challenge

DALLAS — Users of "information resources" need to do more long-range planning, but such planning will "challenge some basic ways we do business," Harvey L. Poppel, a consultant with Booz, Allen & Hamilton, Inc.

Maybe such planning will even cause some organizational changes, according to Poppel.

Information resources encompass much more than just DP, Poppel contended, noting "our professions go beyond the computer itself and encompass all the information resources of a firm."

In the 20 years of computer use, he said the technology had moved forward at a "startling" pace, but the ability of manufacturers to change that technology into products has lagged.

"But even more importantly, the ability to manage the technology has lagged way behind both the technology and the ability of manufacturers to translate that technology into products," Poppel said.

There are seven basic reasons for this, Poppel stated. There has been a failure of the people using the systems to understand the business they are in and a failure to grasp the total problem in using information resources.

In addition, DPers have failed to adequately explore alternatives, properly estimate development efforts in the area and properly anticipate the resistance to such projects, Poppel charged.

Finally, there has been a failure to gauge the impact of information resources and a failure to control the results of information resource efforts.

Today, users are facing an even "more difficult environment" where DP, communications processing and word processing are all interacting and affecting "human processing" within organizations, Poppel suggested.

You Get the Best Compact Terminals from CDI Because That's All We Make.

When it comes to compact printing terminals, we only know how to make the *best*. The MINITERM family!

We put extra design and engineering effort, plus the highest quality materials into our products so you get the most out of them.

You get more features and more quality in every CDI model. It all starts with the **Q-3 thermal printer** for OEM's, heart of the MINITERM family, followed by the **MINITERM 1201 Receive-Only** terminal, then the **MINITERM 1202 Desk-top terminal** and the **MINITERM 1203 timesharing portable** with acoustic coupler and exclusive three-way keyboard. And introducing the *NEW* **MINITERM 1204 ASR**, with Random Access Memory and integral magnetic tape cassettes for off-line data preparation and high-speed editing.

The most features, highest reliability, greatest versatility per dollar; that's the only way to make the *best* terminals in a compact package.

Get them all — and only — from CDI. Call or write today for the CDI office nearest you.

At last. The small business systems nobody's waiting for.

Data General's new Commercial Systems CS/40 models. They don't keep you waiting because they work the way business works. Interactively.

Multiterminals, no waiting. CS/40 puts data processing power right where your people need it, when they need it. In a distributed network or as a stand-alone system handling multiterminal applications or multiple single terminal applications or both. So some users could be updating inventory, while others enter orders, check payables, and process the payroll. All at the same time. And managers can still access the system any time.

It speaks your language. Interactive ANSI '74 COBOL, the standard business computer language and the language of large computers. With its COBOL, CS/40 has interactive debugging and workstation management, which makes it easier to use from the start.

Small doesn't mean limited. Three compatible models assure that as your company grows, CS/40 can grow along with you. And CS/40 can communicate with other popular commercial systems including our own. With features like up to 40 million bytes of online disc storage. And enough memory for large applications. Plus utility software you wouldn't expect on a small system. And a smart spooler that frees up terminals so your system can do more work.

And everything else you'd expect from Data General. Like innovation, because we put a larger share of our revenues into R & D than any other major computer manufacturer. Like reliability, because we make virtually everything we sell. Add attractive quantity discounts, solid systems engineering, field service and our superior price/performance and you'll understand why there are already over 39,000 systems installed worldwide.

Why wait any longer?

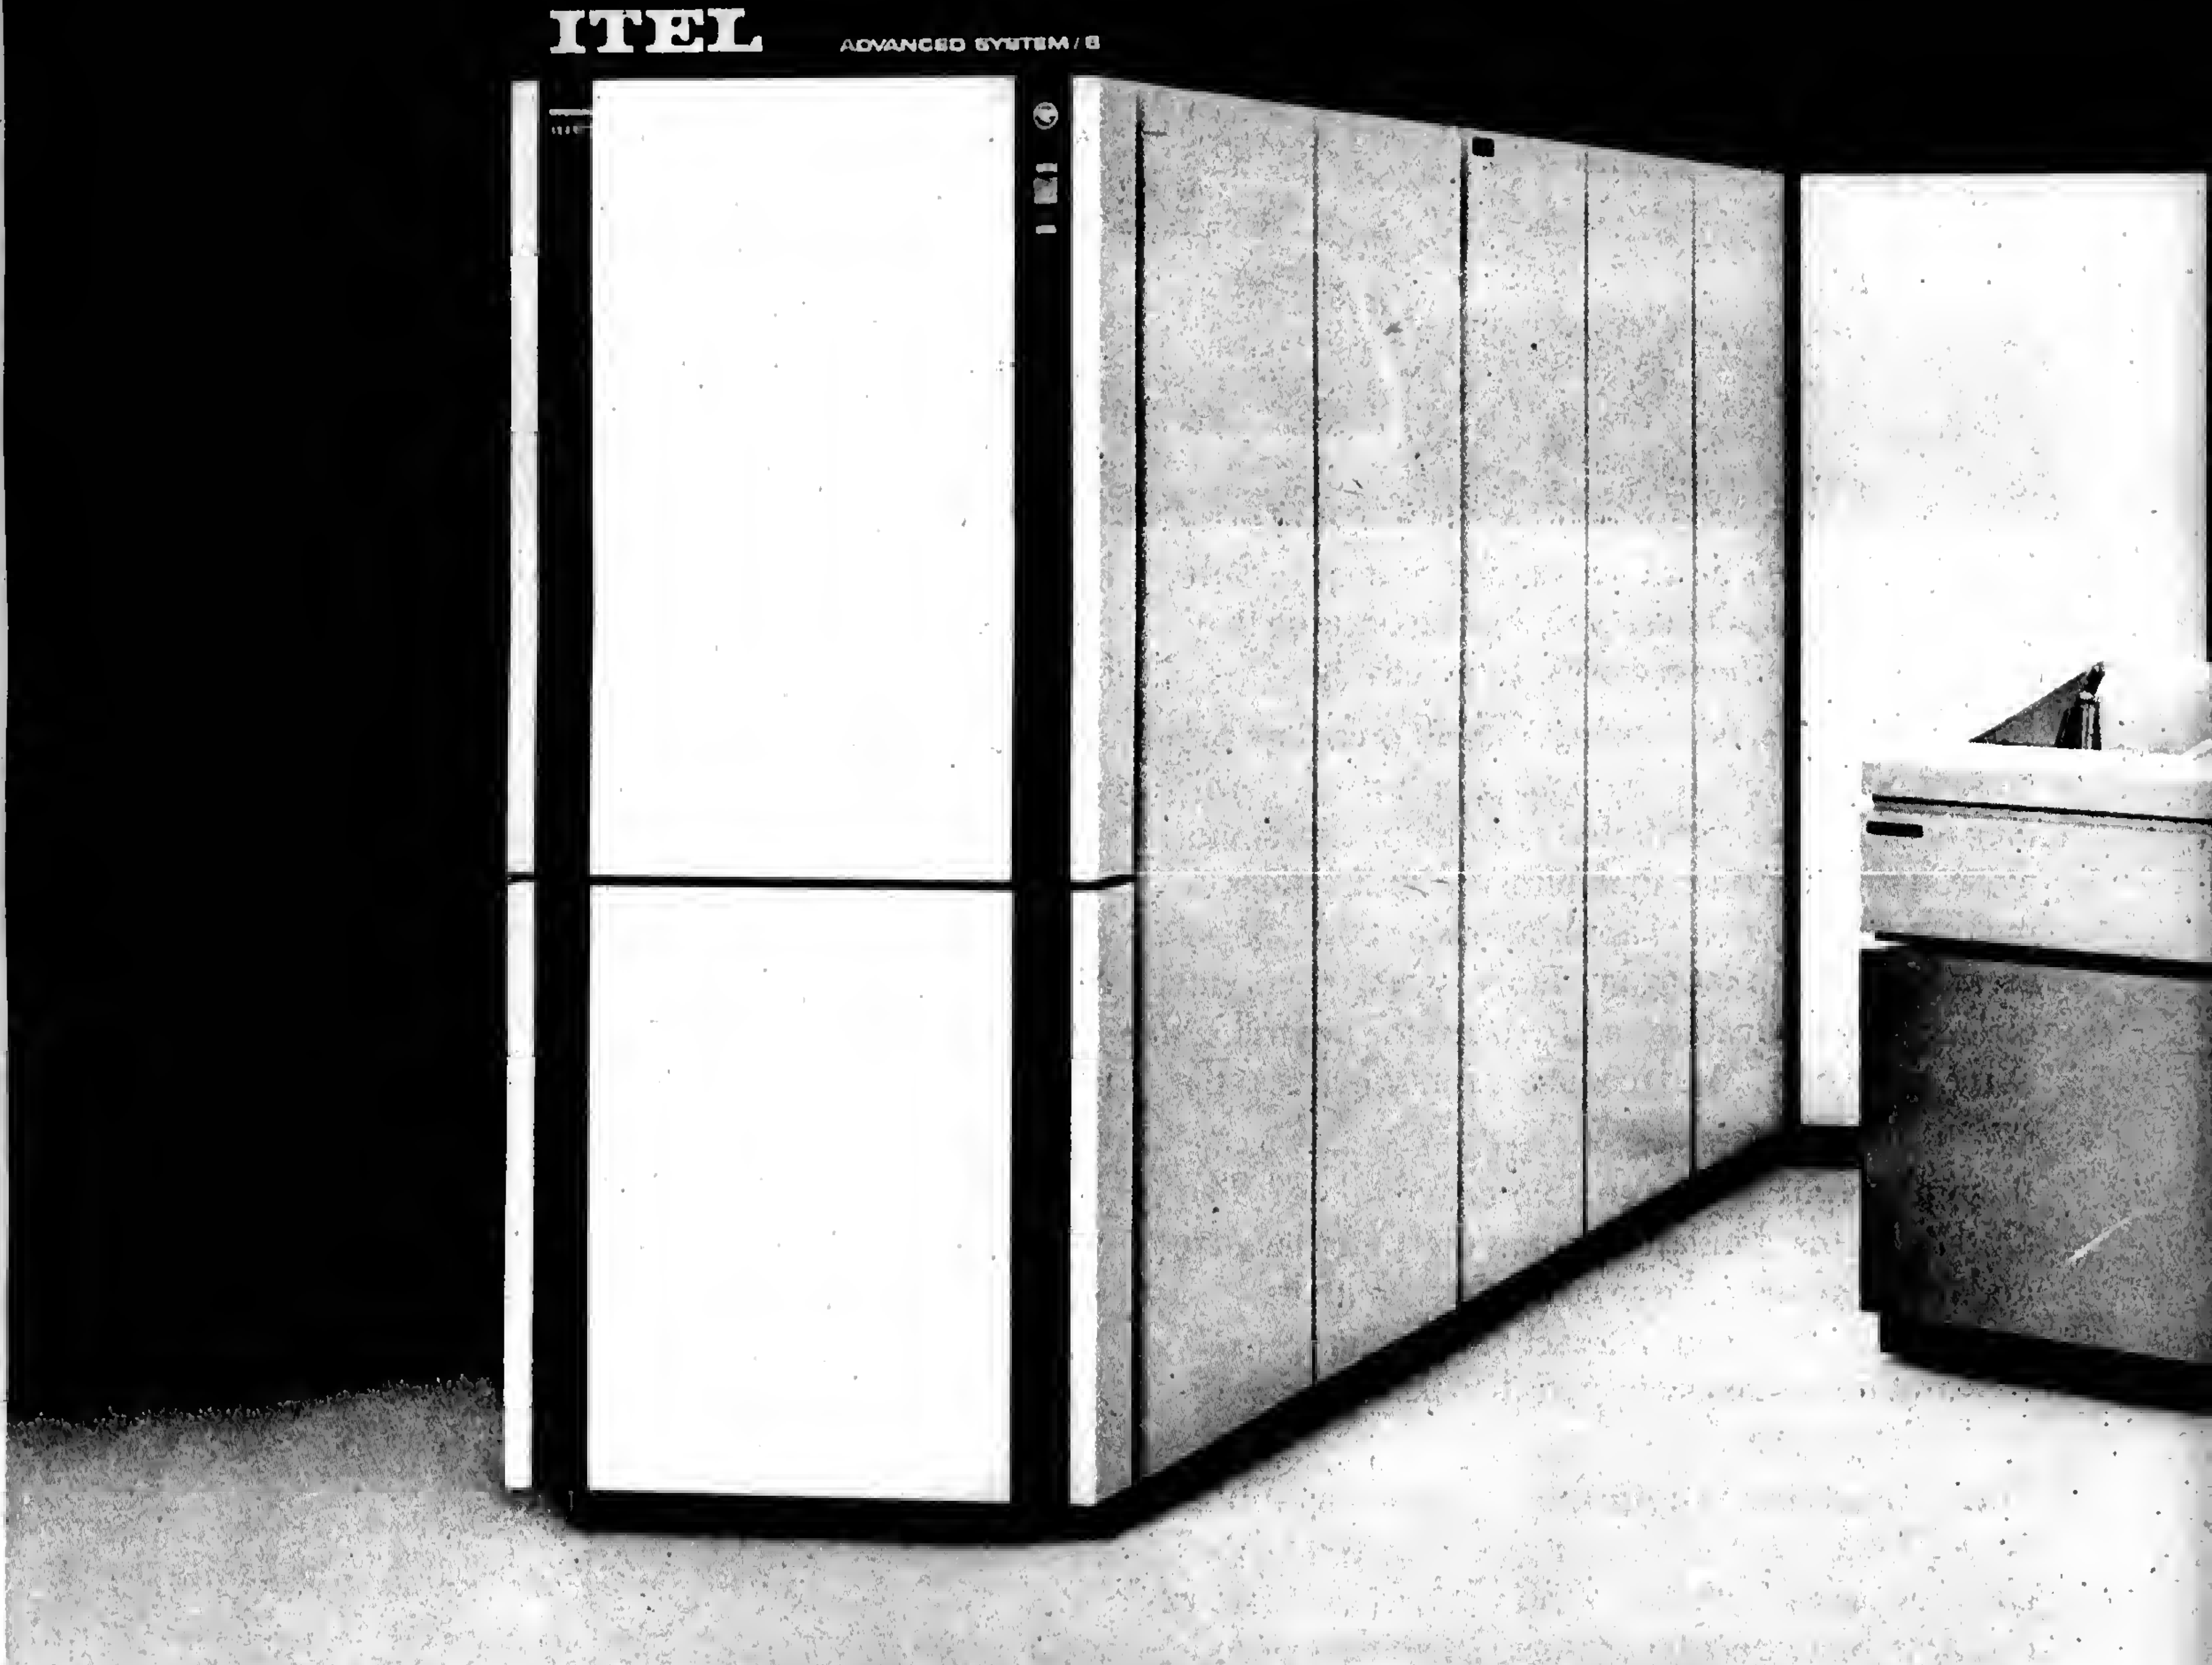
INTRODUCING A NEW ITEL COMPUTER



That's right, Itel's newest Advanced System™ can cost up to $1,000,000 less than its IBM equivalent, the 370/168-3. And featuring advanced technology utilizing high-speed Medium-Scale and Large-Scale integration circuitry, the AS-6 is three to four times more powerful than our AS-5.

Like the AS-4 and AS-5, Itel's AS-6 is designed to be a direct replacement for its IBM equivalent, and is fully compatible with IBM 360 and 370 software. And

AND A MILLION GOOD REASONS TO BUY IT.

our AS-6 has several clear advantages over its IBM counterpart. For example, the AS-6 takes up about half the floor space of the 168. And it's air cooled, so there's no need for the intricate water cooling systems required by comparable IBM CPUs.

With the new AS-6 and the rest of our Advanced System computer line, Itel now offers a broad range of sensible alternatives with substantial price/performance advantages. But then, when it comes to price/performance, Itel has always had a considerable edge. Not only in total computer capability, but in systems and software, in computer peripherals, in field engineering and in financial packaging.

Itel. The sensible alternative.

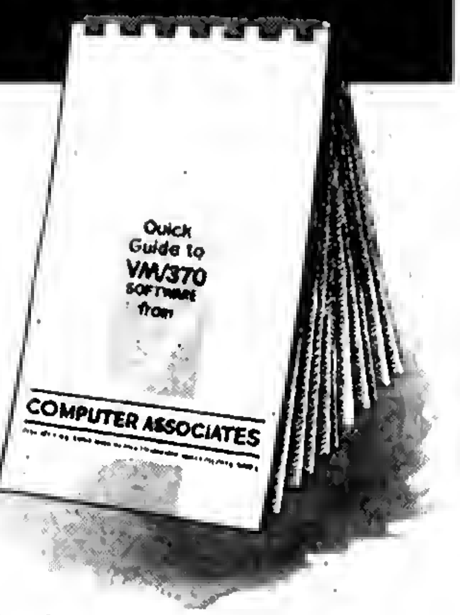
NOW... FOR VM/370 USERS



We have a new software systems catalog for VM/370 users and we'd like to send it to you.

BUT IBM WON'T TELL US WHERE YOU ARE!

You'll learn about the famed Computer Associates software products and systems that will far outperform any comparable ones you're using now. They'll save you time and money!

- **SYMBUG:** A completely integrated debugging system for the interactive debugging of COBOL, Fortran and Assembler programs.
- **IDOS/VS:** An interactive DOS/VS programming facility for VM/370 systems that allows DOS and CMS environments to exist concurrently in the same virtual machine.
- **VSORT:** Implementation of OS sort compatibility for CMS. Functions as a stand-alone utility, as support for COBOL Sort verb or callable from PL/I or Assembler routines.
- **ISAM:** CMS simulation of OS ISAM It also provides a CMS ISAM utility command to create, dump and reorganize an ISAM file.

COMPUTER ASSOCIATES IS ONE OF THE WORLD'S MOST DISTINGUISHED SOFTWARE RESEARCH AND DEVELOPMENT ORGANIZATIONS.

We serve you through offices throughout the United States and world-wide.

Inquiry System Helps Firm Style Product Line

MERRIAM, Kan. — A terminal-based inquiry system is helping the H.D. Lee Co., Inc. plan, monitor and react to the ever-changing needs of the apparel industry. The system meets these needs by allowing personnel to access files and ask spontaneous questions regarding all aspects of the company's clothing business.

With other systems, a program has to be written and stored for each specific question that is to be asked and answered. But with the system Lee uses, IBM's Interactive Query and Report Processor (IQRP), there is virtually no limit to the type and variety of questions: if the facts needed to answer them are on file, the system provides the answer in about 20 seconds. This can lead to another question, another answer, etc., in a conversational "what if" sequence, if desired, according to Peter D. Day, manager of merchandise planning.

To ensure that those facts are there for merchandise planning, for example, Lee has developed a file of sales history for previous seasons. Each lot number has been identified by some 20 variables. The system permits Lee management to look at trends by one or any combination of these variables. Also stored is data on the current season, including sales, forecasts, production quantities and a projection of sales data.

Clearer Picture

With this information available to be shuffled and manipulated as the terminal user wants, the system gives Lee management a view of the overall merchandising structure and complexity that was impossible to achieve before, Day said. It also provides a capability to survey and define, to clarify specific merchandising objectives and to analyze whether these objectives are being achieved.

"In the apparel industry we all recognize that mistakes lead to expensive obsolescence," Day said. "But since IQRP was implemetned in the spring of 1976 it has helped us make the positive decisions that generate profits, not mistakes," he added.

"For example, if we are to do the most effective job of planning our product line, making our piece-goods commitments, gearing up our manufacturing plans and sending our salesmen off in the right directions, we must have a good idea of how successfully each specific product classification sold in past years. But we must also look for ways of defining the product category in terms of what we believe current market conditions will be, not as we would have defined things two years ago," Day explained.

"Through its flexibility, IQRP enables someone like me who knows nothing about DP, to sit at an IBM 3270 video display terminal and interpret history so that we can redefine each marketing classification as it should be today. This was impractical to do manually," he noted.

"In short," Day said, "in preseason planning, the system enables us to formulate overall sales goals by product categories and give merchandise assignments, by type and quantity, of product needed to yield the desired goals by line."

Further, the data enables Lee personnel to develop a detailed merchandise planning report. It is set up by fashion group and within each group, by a breakdown of units, percentage to total for the season, count and yield — by month for the past six seasons, then the forecast for the next two seasons.

Lee managers can look at these figures over time and make a forecast through the next season by fashion group and by total for the division. Fashion groups change, of course, and IQRP enables Lee to change with them easily. Trying to do so with manual data would be difficult, Day noted.

"We can also do price-point analysis, breakdown fashion group forecasting by fabric type and tell the merchandiser what his budget is by each fabric type," he added. "Thus, we can start with the company budget for the year, then break it down by division, by season, by fashion group and by fabric type."

The system is also of value outside the merchandising area. For example, purchasing personnel needed to make a long-range commitment on corduroy. Therefore, Day just keyed in the words "subtotal corduroy by season" and the terminal displayed the needs companywide by season, plus an 18-month history of corduroy usage. By looking at trends, he could derive a reasonably accurate forecast.

In addition to preseason planning, Lee personnel use IQRP in season, mainly to summarize it into "blocks," which they use to compare with planned production by group and see immediately where problems of under- or overforecasting exist. Then they can turn again to the system and see, by lot number, specifically where the problem areas are — or they can look at the problem by a fashion group, fabric or type of garment.

"We can see what's going strong and boost its production, or what isn't and cut its production" Day said. "The system can also produce 'exception' data, such as a list of all items exceeding projections by 'X' percent, or falling below projected sales by 'Y' percent. The printout is generated by our IBM 370/158 and delivered to the planning department within about 30 minutes," he indicated.

"However, IQRP is not simply exception reporting," he claimed, "because it enables us to look at everything we want to. It's more of a management screening device. If you build the information file right, and we think we have, its potential is tremendous."

All data bases are updated at least weekly and some of the files, such as customer inquiry information, are updated daily. IQRP is also used:

- To produce accounts receivable data — such as the top 10 accounts in terms of purchases or a listing of those with certain credit problems.
- For checking raw material receipts, tyically to be certain they will meet production planning needs.
- For order status, usually on the day's expected shipments.
- By the DP department to check stored prices.

State's Disk Upgrade 'Promotes Deflation'

(Continued from Page 26)

tion Center (NCIC) in Washington, D.C.

The network permits immediate dissemination of data on crime and other vital data related to law enforcement and judicial activities, according to a spokesman.

Another user of the state's central DP facility is the Finance and Administration Department, which is responsible for budgets, accounting, drivers' licenses, motor vehicles, taxing and payroll.

Addition of the IBM IMS software, now possible because of the increased disk storage capacity, will allow support of the state's sales tax system. About 10 terminals will be installed for inquiry, correction of records and review of revenue accounts, he said.

Still other departments and functions supported by the facility include the state Social Security Division, the Governor's Office, the Teacher and Public Retirement Programs, Highway Safety Program, State Treasurer's Office and the Department of Corrections.

The Interconnect Answer

COMPUTE

Textile Rental Companies Cooperate on Mini Venture

By Esther Surden
Of the CW Staff

INDIANAPOLIS — It's sometimes difficult for a small business person operating within the confines of his specialization to find a DP system that fits his needs from among those offered by traditional minicomputer vendors.

So Commercial Towel and Uniform Service, Inc., here, a textile rental firm, took a different approach, according to Theodore Kline, vice-president.

The firm turned to a consultant familiar with both DP and the particular needs of the textile rental industry and then, with several other firms, underwrote the development of a turnkey system designed to fit textile rental industry's needs.

Each of the firms put up $25,000 to develop the small business system, in a venture that seems to have paid off well for the companies involved.

The mini was just recently installed, Kline noted, and is currently running only the route accounting and accounts receivable application. Future applications that should be running shortly include management information and payroll, Kline added.

Firm's Automation Roots

Like many small businesses, Commercial began automating its office with the installation of tabulating equipment some 15 years ago. Like others, the firm outgrew this equipment, so Kline began looking around for an alternative.

Although an industry-specific service bureau does exist, the firm thought it "expensive and not flexible" to take this route and so Commercial decided on an in-house system, he said.

But the expense of an in-house system configured exactly to the firm's requirements would have been exorbitant.

Commercial wasn't sure what to do until it turned to Markman and Associates of Bala Cynwyd, Pa., which specializes in DP consulting in the textile rental field. The consultants, Herbert Markman and Edward J. Keegan, had a reputation in the industry, Kline noted.

They suggested pooling resources with four other small firms to come up with a system, Markman explained. It seemed like a good idea, so the five companies got together to determine some general criteria for their system.

First, they wanted a system that would not only be adequate for present needs but would be expandable without reprogramming. The system also had to use state-of-the-art equipment, because none of the textile rental firms wanted to outgrow it too quickly or find it obsoleted as soon as it was installed.

All of the companies wanted the mini to be easily operated by present employees.

The selection of a vendor was left up to the consulting firm. "We have no one on our staff who has that kind of expertise," Kline explained.

The consulting firm then began its consideration of minicomputer gear. "We did a survey of vendors," Markman recalled; and the list was narrowed to either Hewlett-Packard or Data General Corp. because, among other reasons, "we wanted a financially sound vendor, someone who could give us a consistent supply."

HP "was not price-competitive at that time," he noted, so the firm chose a DG Nova or Eclipse as the basis of the system that was to be installed in each of the five firms. The consultants "sent us all the information and eliminated" all the vendors who did not qualify, Kline noted.

The installation at Commercial includes a 96K Nova 3 CPU with 92M bytes of disk, a 300' line/min printer, magnetic tape unit and three CRTs.

The system handles about 6,000 customers. When completed, it should provide the firm with information about customer history according to route, plant, customer, service detail and items served, he said.

It will also generate reports such as contract renewal reports, customer analysis reports, general ledger, sales analysis, items served, and a new and lost business report.

It also interfaces to industry packages sponsored by the Linen Supply Association of America. One called Computer Assisted Route Development runs on a Control Data Corp. system at the association and is a system for structuring route and optimizing truck routes to minimize time and mileage. The turnkey system produces a tape that interfaces with this system.

The Turnkey — Part 1

System Choice Demands User Initiative

By Vincent Deschamps
Special to Computerworld

When it comes down to the bottom line, the responsibilities for the installation of a minicomputer-oriented system ultimately rest with the user.

It is the user who has more to lose than anyone else who may be involved in the selection and installation of a mini-oriented, "turnkey" business system. It is the user's business that is at stake. And, for the most part, it is the user who knows the least about which system is right or wrong for the business applications he wishes to automate.

This is the first installment of a three-part series dealing with successfully installing a turnkey minicomputer. Next week's installment, also addressed to first-time users, will detail the selection process, contractual arrangements, implementation procedures and schedules.

Remember, a vendor knows little about your particular business. If it claims to have a 'do-all" system for everybody, be suspicious. This may represent a seller's motivation — not necessarily a buyer's solution.

Keep your eyes open wide. Here are some rules to help keep you out of the "divorce court."

Potential users should cling to real-world situations. Avoid positions, thinking or statements that your predecessors have made, such as: "I told those computer people I didn't know anything"; "I expect this computer system to do everything in the world"; "The salesman assured me my computer would never run down"; and "Why can't we transmit data via satellite from New York to New Jersey?"

Minicomputer vendors prefer to sell only the systems they've developed, often disregarding users' hardware and software requirements.

Because of the relatively low price of minicomputer systems, as compared with the price tag for more powerful mainframe configurations, "off-the-shelf" systems provide manufacturers with the profitability and simplicity needed for effective marketing.

Customized systems represent add-on costs and a possible trap for the manufacturer to end up building unique systems. With the rise in price to include user options or specialized hardware and software, a custom system can end up like Mr. Blanding's dream house — costing as much as or more than a large system.

The right hardware may not be the cheapest. Hardware should be evaluated after the user analyzes his own business applications and volumes.

Another user trap may be either the underengineered or overengineered minicomputer system. It fails to live up to vendor salesmen's promises or loads the user up with gear he doesn't need now or in the foreseeable future.

The user also occasionally falls into the "Numero Uno" syndrome. Impressed by the size and reputation of the giant, he feels safe in selecting No. 1's gear, which may end up giving the user the biggest headache. The giants shy away from turnkey, total responsibility systems.

Distributors of minicomputers now offer only one manufacturer's product to the end user. It is not unusual for so-called turnkey systems to suddenly, after installation, require additional, expensive software or add-on peripherals to meet user requirements.

It's your business. An unsuccessful installation can put a user out of business. It's difficult and expensive to convert from an in-house system back to your previous sys-

(Continued on Page 33)

Datapro Report Tackles Mystery Of Implementing Small Systems

DELRAN, N.J. — A 14-page report "designed to take the mystery out of acquiring and implementing an effective small business system" is available from Datapro Research Corp.

The report provides an introduction to small business systems and practical advice on justifying, selecting, manning, installing and converting to the units.

For example, users are often confused by specifications such as processor speed given by manufacturers. "The critical factor for judging a business minicomputer's useful speed is usually the speed at which the input and output devices operate, because the processor can operate far faster than you can either enter the data or see the results printed," the article advised.

Business people shouldn't be lured to a small business system just because the business's competition are all getting one, the report continued. If the system can help out in an area that is "chronically over budget, late in meeting schedules or effectively operating without management control," a minicomputer can be of help, the researchers noted.

Call References

"By all means, call the companies on the vendor's reference lists," the report continued. It suggested a list of questions to ask, including "Were the programs delivered on time?" and "Is the servicing of the equipment prompt and effective?"

Take the system for a test drive and insist on making some postings yourself, the report advised. That way you can find out if it is easy to operate and lets you correct mistakes easily.

The report also covers such topics as the rent/buy decision, requests for proposals, feasibility studies, vendor selection and converting to the system. It costs $12 from the firm at 1805 Underwood Blvd., Delran, N.J. 08075.

Switch From Service Bureau Saves City $2,700/Year

By Esther Surden
Of the CW Staff

CARIBOU, Maine — The city of Caribou is saving an estimated $2,700 yearly in service bureau fees and has cut part-time personnel with the installation of a small business system.

The city, with a population of 11,000, needed a system to perform its tax assessment billing application, a complicated task that had formerly been handled manually, according to Terry St. Peter, city manager.

"We looked at several small machines," he said, including systems from Burroughs, NCR, Olivetti and Digital Equipment Corp. The city also looked at IBM, but less closely than the others, he indicated.

"We looked at hardware and software together. We had no computer programming capability here, so we needed to buy packages.

"The DEC Datasystem 310 seemed to be the closest thing to an IBM 3 but for less cost. It seemed to have the advantage of flexibility but on a basis that we could afford," he said.

Turnkey Vendor

The city got its system through a turnkey vendor, Datasystems of Maine. "They were just starting up at the time we started this venture. I believe we responded to some circular. We have never had any direct dealings with Digital," St. Peter said.

Prior to the installation of the system, the city had hired an extra part-time person assigned to help with the tax assessment chore.

The clerk helped the existing office staff type the evaluation books, then followed that up by typing the bills one at a time — all 5,000 of them.

"Then we had to type a collection book," which records the receipts from the taxpayers.

Now the system takes care of the entire application from start to finish, according to St. Peter.

The city is also performing a payroll application for the municipal employees and the school district on the small system. Previously, although the city was responsible for the school department's payroll, it was contracted out to a bank to be done on its computer.

"We did our own municipal payroll of 90 employees by hand," St. Peter said.

Both payrolls are now handled by the small business system via two payroll packages bought from Datasystems. It covers about 330 people on the city's payroll.

The city plans to put additional applications on the system and is training one of the city workers at DEC's programming school.

"We would expect to still buy packages, but I'm hoping that this will give us the capability to make some changes and maybe do some small programs here," St. Peter said.

A voter registration package is on the agenda to be placed on the system as soon as it is programmed in-house, he added.

"The sewer district is now purchasing a sewer billing package for use on the system as well," he noted.

Slow and Careful

"We have really gone about this slowly and carefully. We recognized we were on the ground floor with this software house that was just beginning; and we have really had to make some changes in order to develop the system to our satisfaction with their cooperation," St. Peter said.

It took a little longer than anticipated, he noted, but presented no real problems to the city.

After Lightning Strikes

User Mixes Memory From Independents

By Frank Vaughan
Of the CW Staff

UPLAND, Ind. — Officials of a university computing center here are operating their minicomputer with add-on memories from two different outside vendors following a lightning strike that crippled the system last summer.

As a result of that lightning incident, Taylor University's Digital Equipment Corp. PDP 11/40 is currently operating with 28K words of DEC core, 32K words of Cambridge Memories, Inc. and 32K words of Fabri-tek add-on, according to John Kastelein, director of the computing center.

The university purchased its 11/40 in November 1973. The mini came configured with 28K of core and operated in that configuration until the summer of 1975 when the decision was made to use DEC's RSTS-E operating system, he said.

RSTS-E required 30K of memory, so the university purchased 32K from Cambridge to facilitate the operating system, he noted. No difficulties were encountered with the Cambridge add-on until the lighting strike crashed the system in June 1976.

"We had a DEC repairman come in and he worked on the system for three or four days and finally fixed the equipment. The Cambridge memory was knocked out, so we shipped the boards off to Cambridge and resigned ourselves to the fate of not being able to run our RSTS-E until they came back," Kastelein said.

Deadlines Closing In

One week after the boards were sent back, the Cambridge plant closed, because of financial difficulties, leaving the university with no memory, no commitments and no hope of meeting the requirements for grades, billing and registration deadlines that were drawing near.

"Since we had no idea what was going to happen at Cambridge, we made a commitment to purchase 32K from Fabri-Tek, providing they could loan us a system until they could ship a permanent replacement," Kestelein said.

"Fabri-Tek came through with the memory for us and we were on our feet again," he said.

Meanwhile, Cambridge Memories reopened and returned the lightning-struck boards to Taylor. The boards didn't work, so this time Kastelein shipped back boards, cage, power supply and everything, he said.

By December the university had both the Fabri-Tek and the Cambridge memories on-line and operating.

"At this point in time we are considering adding another 32K of Fabri-Tek, especially since the interfacing has gone so well," Kastelein said.

Micos II for Small Businesses Uses 'Proven' System Software

ELMSFORD, N.Y. — Minicomputer Systems, Inc. has introduced a lower cost version of its Micos small business system.

The Micos II is "a stripped-down version" of the larger Micos system and is designed to satisfy user requirements for a flexible system with proven systems software as well as applications, the vendor said.

It is said to be comparable to the Microdata Corp. Express and IBM System 34 and can accommodate high-speed data transmission either from terminals or in system-to-system networks.

The basic system includes a 65K Data General Corp. Nova 3/4 CPU, a 10M-byte disk drive, line printer, CRT and the Micos II operating system. The system takes advantage of a recently introduced application software product called Application Programming Tools (APT), the company said.

APT offers the facility of faster program development thorugh the use of program generators for input screens, files and reports. The programming language used with APT is called Extensive Basic, an MCS spokesman added.

The Micos II system can be used in stand-alone mode or in distributed processing applications.

The basic system costs $28,750 from the firm at 525 Executive Blvd., Elmsford, N.Y. 10523.

Sykes Floppy Fits IBM 5100

ROCHESTER, N.Y. — The Comm-Stor/5100 is a floppy disk system designed for use with the IBM 5100 portable unit, according to its vendor, Sykes Datatronics, Inc.

The system is said to fill several needs unanswered by the IBM 5100: it produces floppy disk media readable by larger IBM systems and provides a random-access capability, a spokesman said.

The microprocessor-based unit plugs directly into the IBM 5100's serial I/O port without changes to the 5100 hardware or software, Sykes claimed.

The Comm-Stor comes supplied with a tape cartridge containing 10 Basic key files and 14 APL functions.

A single drive costs about $3,000 and a dual drive is priced at $4,000 from Sykes at 375 Orchard St., Rochester, N.Y. 14606.

Aris Turnkey Performs Publishing Applications

PLAINVIEW N.Y. — Aris Associates is offering a minicomputer-based system for publishers with 2,000 to 4,000 titles in inventory.

The system can handle 300 to 600 orders per day, order picking, invoicing and accounts receivable, according to the vendor.

In addition, subscription fulfillment for up to 10,000 subscribers per issue can be processed on an on-line basis for monthly and quarterly issues in combination with book orders, according to a spokesman.

Other applications that can be handled on the system include purchase order control, inventory replenishment, accounts payable and general ledger.

A typical system includes 64K of memory, two 10 million-character disk files, a 600 line/min printer and two CRTs and costs $85,000 including software.

A basic system with a low-speed printer and one CRT costs $39,000. The firm is located at 20 Central Park Road, Plainview, N.Y. 11803.

Turnkey Choice Needs Users' Involvement

(Continued from Page 31)

tem, even if it doesn't live up to your expectations.

Sometimes, the programming you've requested and had delivered may be extremely costly and absolutely useless if you change over. And sometimes the whole matter ends up in litigation.

The user might be helped by comparing the purchase or lease of a minicomputer to the purchase of life insurance, You would not purchase life insurance on the basis of price alone, without assessing what you really need to protect yourself for the future.

With this in mind, be skeptical of companies offering the moon for 50% less than everyone else and double-your-money-back guarantees. The business may not survive to get double its money back.

In summation, the user must:

- Know what he wants to accomplish.
- Take the time to have a feasibility study done or have the system designed correctly, the first time.
- Test the system before it is installed.
- Run his existing parallel system before stepping into the deep unknown.
- Install a system slowly, making certain that it meets or exceeds established benchmarks and criteria.
- Visit other existing user installations and obtain a candid critique of their experiences with the system.

The hardware should be:

- Capable of performing present tasks and future, realistic tasks for five to seven years.
- Manufactured by a reputable hardware manufacturer.
- Cost-justifiable.
- Complete without hidden, open-end software programming charges.
- Proven effective as quickly as possible.
- Delivered, installed and operational within a few weeks.

The vendor's responsibility is to:

- Know what his system can't do.
- Not oversell or undersell hardware.
- Understand the software job the user wants and either be prepared to do it at a fair price or tell the user to get someone who can do it — before he accepts the order.
- Avoid agreeing to unrealistic deadlines.
- Respect the customer.
- Treat the customer's business as if it were his own.

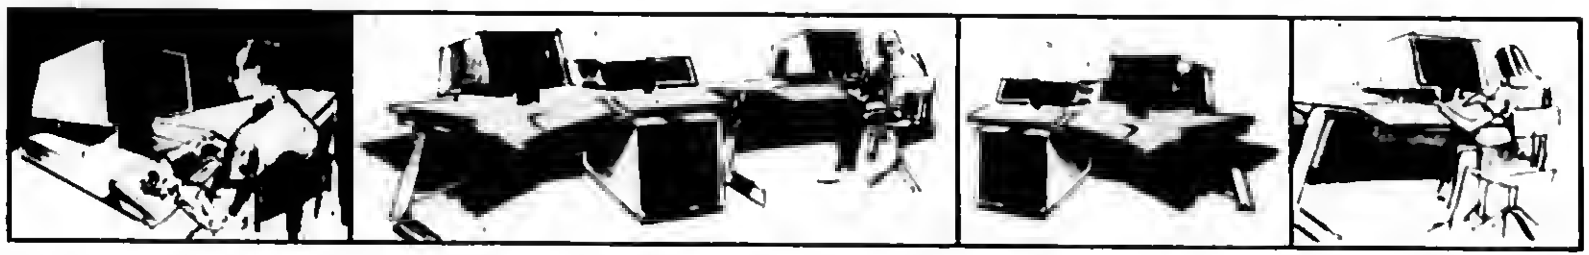
Deschamps is president of Turnkey Sales & Leasing, Inc., New York, N.Y.

Attention: Business Computer Distributors

Don't sell your customers just another computer...

when you can select from the most comprehensive family of business computer systems ever offered...

The SYNERGIST™
BUSINESS SYSTEMS



Start with the broadest choice of business systems ever offered. From a small business mini, to large shared-resource computer networks. Using the industry's most reliable, best price/performance computer mainframe. The Digital Computer D-116, already proven in over 10,000 installations.

Add the broadest line of disk systems, CRT terminals, workstations and printers. Designed and tested to operate together in nearly limitless combinations.

Add operating systems. Application libraries. Software support and our unique Executive Inquiry System, "EIS".

Training programs and maintenance support. Developed through years of business computer experience.

Put it together with one company responsible for system engineering, compatible operation and reliability.

End up with systems with a difference. Systems that can be scaled up without expensive reprogramming. That can start small without future penalty. With big system features. Like plain English requests for special reports. Text retrieval systems. Confidential file security. Spoolers. Editors. Performance at every size level at a price more businesses can afford.

We're still adding the most important part. The smartest, best managed distributors in the business. It's the final link that makes our systems work. If you're the link we missed, write, or call Ronald S. Harvey, Business Systems Sales Manager, 201-575-9100.

Ask about our "Master Distributor," "Private Label" and "Dealership" programs.

We're Digital Computer Controls, Inc. The company that other computer companies call *their* computer company.

Agents Match Clients, Houses With Help From Mini

Special to Computerworld

MELVILLE, N.Y. — A minicomputer has proven to be the key to opening doors for real estate agents here.

The system, located at Multiple Listing Service of Long Island, Inc. (MLS), has been credited with making the job of finding the right house for the right client more efficient.

MLS is an amalgamation of 659 participating offices in the resale home market in Queens, Nassau and Suffolk counties.

Of all the minicomputer's functions, the one that seems to trigger the most sales is a residential analysis done on the portable terminals the agents use. One broker reported the analysis has brought him a minimum of one home sale a month — at an average price of $60,000 — since the system was installed in April.

The analysis is often the clincher for the prospect who isn't sure he can afford the home, according to Val Mason of Butterfield Realty. The prospect is asked to provide the amount of his monthly rent and his estimated income. Once this data has been entered, the terminal prints out the price he can afford without spending more than he does now.

The terminal also prints the income tax benefits which will accrue based on his real estate tax rate and what his equity will be over the next five or 10 years based on amortization and a 5% increment for use "appreciation."

For example, a father of one earning $20,000 a year and paying $375 a month for rent finds that the same payment will bring him (after a downpayment of $9,000) a $45,000 house in which, based on the formula, he will have a $23,055.90 equity in five years and a $41,402 equity in 10 years.

According to realtors, the terminal's printout of these compilations is generally seized upon by the prospect for further study at home.

Listing Update

The bread-and-butter function of the system, and one which relates directly to MLS's prime function, is the listing update.

With the system, all listings received from the association are entered into the mini and are immediately available to the terminal subscribers. Members not on the system receive their information by messenger up to 24 hours later.

Because of the competitive edge it gives them, many of the subscribers request the listing updates three times a day.

Subscribing agents can also enter their prospects' requirements — such as number of rooms, baths and preferred neighborhood — by code so that another agent can search through them. If he has anything which satisfies the requirements, he can then contact the prospect's agent and suggest that a particular home listing with the calling agent be shown.

On the selling side, through its ability to list "comparables," what similar houses have sold for and are currently selling for, the system helps agents keep their clients attuned to reality.

When a homeowner comes in to list a house, he often has an inflated idea of what it will bring. The system can print out a list of comparable homes which are on the market now and against which his home is, in effect, competing.

Since it was introduced in April, the system has grown consistently. So far, approximately 18% of MLS's membership has signed up.

According to Margot Wolf, "that is about the number of agents and clerical employees which can be trained at MLS headquarters in Melville, Long Island."

The only charge for the system is $158 per month for the terminal.

One Complaint

The only complaint about the system is that when the new listings come in — seconds after they have been entered — they lack the photograph that is a standard part of the manually distributed hard copy.

However, as one broker pointed out, "We are beginning to find out that the lack of the photo is an advantage. If we get a match between a listing and what the prospect has asked for we can tell him we've got just what he asked for.

"Sometimes with the photograph we tell the prospect that and he says 'Yes. That's what I asked for, but I don't like it.' "

The system is a Hewlett-Packard 21MX, programmed by Realtronics, Inc. of McLean, Va.

Realtor Art Kaufman uses a portable terminal hooked up to a mini to find an appropriate home for his prospects.

Better Software for Minis Seen Future User Demand

By John P. Hebert
Of the CW Staff

WOBURN, Mass.— What is the most important trend in the area of minicomputers?

This question was asked of the four workshop session leaders at a meeting here recently and drew responses ranging from the need for better software to stiffer competition for vendors of only minicomputers.

Minicomputer vendors will have to provide better software and maintenance in the future to help the end user do his job in the easiest manner and bring up applications quickly, according to John Kogan, a consultant with Arthur Andersen & Co.

Eric Frey, president of Frey Associates, said he saw minicomputers doing exactly the same thing large machines were doing 10 years ago. As a result, Frey said, the future trend for minicomputers will be to grow the way mainframes have for the past 10 years.

Len Farano, executive vice-president of Gambit Management Strategies, Inc., saw two trends. One was a greater awareness on the part of users in making business decisions.

Shake-Out Predicted

Second, the arrival of mainframers in the minicomputer marketplace will bring about a "shake-out," Farano said. Users will get a better product from the resulting competition, he added.

The fourth speaker, Art Gravina, president of Cybek Corp., noted that although minicomputer hardware is far advanced, software for the machines is back in the 1960 to 1965 era. And "hardware without software is useless," Gravina said.

Megatek Turnkey Includes DG Nova

SAN DIEGO, Calif. — Megatek Corp.'s 5000 series is a turnkey graphics system based on Data General Corp. Nova equipment.

The system, which includes a graphics display and Nova minicomputer, has 12-bit screen resolution, a 21-in. monitor, hardware blink and translation, dashed lines and sharp constant intensity vectors, the firm said.

The Nova 3 is expandable to 128K words, comes with an upper- and lower-case keyboard with 20 function keys and features a desk that is used as an operator's work station.

The heart of the system is a microprocessor-based graphic display unit. Called the MG552, it occupies two slots in the Nova and provides graphic conversions, control and display functions.

A basic system with 8K words of semiconductor memory, graphics processor, keyboard, 21-in. electronic monitor, graphics software and desk costs $20,500, a spokesman said from 1055 Shafter St., San Diego, Calif. 92106.

CI Notes

Itel, Hitachi Cooperate On Large-Scale Systems

SAN FRANCISCO — Itel Corp. and Hitachi Ltd. have announced a joint development of large-scale computer systems.

"The companies have been working together for several years to combine the advanced computer technology and manufacturing skills of Hitachi with the extensive marketing, development and field service capabilities of Itel's Data Products Groups," according to John H. Clark, Itel's DPG executive vice-president.

Under the terms of the agreement, Itel will market and maintain the systems in the U.S., Canada, Western Europe, South America and Australia.

It is expected that the new computer systems, an extension of Itel's Advanced System family of computers, will play a vital role in the long-range strategy of penetrating the worldwide computer base.

STC, Memorex End Talks

LOUISVILLE, Colo. — Storage Technology Corp. (STC) and Memorex Corp. have terminated preliminary talks relating to a posible merger [CW, July 4].

Under terms of the Memorex offer, STC would have been merged into Memorex on the basis of .725 shares of Memorex common stock for each share of STC common:

"After giving careful consideration to all the terms and conditions, the Board of Directors of Storage Technology concluded that proceeding further with the merger discussions would not be in the best interests of [the company] and its shareholders," according to Jesse I. Aweida, STC chairman and chief executive officer.

Microdata Proposes Upgrade

IRVINE, Calif. — Microdata Corp. has announced its intention to supply a software-compatible upgrade path from its Reality small business system.

No prices or configurations were announced for the small business system — dubbed Reality Royale — which is expected to have four family members and accommodate up to 128K bytes of memory and 600M bytes of disk.

The system is said to have some of the operating system in programmable read-only memory to increase throughput.

All members of the family from smallest to largest, should be compatible.

Private Sector Emphasis

DOD Draft Stresses Competitive Bids

By Molly Upton
Of the CW Staff

WASHINGTON, D.C. — The Department of Defense (DOD) has prepared a draft updating its policies and guidelines for the acquisition of automatic data processing (ADP) equipment. A final directive is expected to be released in September, a spokesman said.

The draft stressed competitive bidding and increased reliance on the private sector for software and services.

Draft 7905.2, entitled "Acquisition of Automatic Data Processing Equipment, Software and Services," emphasized reliance on a vendor's standard executive software wherever possible.

DOD components should not modify such software themselves solely to improve ADP equipment processing time performance, but should contract with a commercial vendor to develop and maintain DOD-required modifications whenever a significant economic benefit over the life cycle of the system can be documented, according to the draft.

Only in three circumstances can DOD components perform in-house modifications of vendor standard executive software, the instruction said.

The first two exceptions are when mission requirements preclude waiting to have an obvious flaw or error corrected and when the vendor does not agree to develop and maintain a modification which is dictated solely by the need to safeguard DOD information.

The third exception is when the senior ADP policy official determines that modifications, under conditions not specified above, can be accomplished more effectively and efficiently in-house.

Focus on Standardization

The draft also focuses on standardization, and indicates Federal Information Processing Standards (Fips), other than those dealing with standard data elements and representations, shall be specified for mandatory use in procurement documents of software, services and equipment unless a waiver is obtained from the Office of the Assistant Secretary of Defense (Comptroller).

"All contracts for data systems development, maintenance or operations services shall specify the use of DOD standard data elements and codes to the extent they are available and applicable," the draft stated.

Methods of procuring ADP equipment, software and services were ranked in order of preference: functional systems requirements; equipment performance requirements; and a combination of these two, by specified make and model or by sole source.

Some portions of the draft will undergo changes following the recent receipt of comments from various agencies, a spokesman said. Among these are the point at which a single selection office will handle selection of equipment or services to be procured and the threshold level at which a delegation of procurement authority is needed, he added.

The original draft said each military department should establish and maintain a single selection office to develop solicitation documents and evaluate and recommend vendors' proposals.

This single office will handle selection when the value of the equipment or services to be procured is equal to or greater than $250,000, or if a dispersed system is to be centrally designed, programmed and maintained, the draft stated.

Where multiple vendors are involved, the DOD components "shall consider limiting the number of vendors to a practicable maximum of three" per system or installation, according to the draft.

Contracts should identify appropriate tests to validate the system's capability to meet performance requirements.

Value engineering incentive clauses should be used in solicitation documents and contracts in efforts to reduce costs and minimize technological obsolescence, the report indicated.

"Sharing of ADP resources and reutilization of ADP equipment shall be considered as the leading means for satisfying ADP resource requirements," it said.

IBM Trial Testimony Reveals CDC's Expectations, Plans

By Edith Holmes
Of the CW Staff

NEW YORK — Control Data Corp.'s peripheral systems probably won't do as well as the company forecasted they would during 1977, but the OEM business will do better than expected, according to Gordon Brown, CDC vice-president of marketing and planning.

Appearing as a witness here recently on behalf of the U.S. government in the trial of its antitrust suit against IBM, Brown discussed the anticipated percentage growths of various aspects of CDC's peripherals enterprises between now and 1980. He relied primarily on a document which CDC understandably wanted kept confidential — the latest draft of its current long-range plan.

Under that plan, CDC expects to grow in all areas of its peripherals business, Brown stated. Beginning with the OEM area, the CDC vice-president indicated his firm anticipates revenues to increase at a rate of 15% a year.

At one time, CDC had predicted OEM revenues would grow at a rate of 18% between now and 1980; however, this rate was considered too aggressive for "sound long-range planning," Brown said. He had personally recommended a 12% growth rate in the OEM area.

The OEM business is more sensitive to slowdowns in the economy as a whole, Brown told the court. CDC's expectation of two more recessions over the next five years accounts for its conservative revenue growth expectations for this area.

On the other hand, in times of economic recession or depression, users are more likely to invest in peripheral equipment in hopes of improving the overall performance of their computer systems, he said.

This is part of the reasoning behind CDC's expectation that its peripheral systems business, which includes IBM plug-compatible peripherals, will increase 22% each year in revenues for the next few years.

The corporation's business products area is expected to grow 10% in revenues annually through 1980, according to the draft plan.

Producing forms, a full range of disk products and computer room supplies, the business products business is a "cash cow," a business that generally has a positive cash flow, Brown stated.

Finally, the CDC executive noted that the data systems area of the peripherals business is projected to increase between 9% and 10% per year in revenues.

Much of the OEM business is free of the risks associated with the IBM plug-

Pansophic Marks Its Eighth Year With Record Sales

OAK BROOK, Ill. — On April 29, Joseph A. Piscopo cut the first slice of a giant birthday cake — a confection celebrating the eighth anniversary of Pansophic Systems, Inc.

Piscopo, president of the firm, founded it in 1969. Before the first year was over, its first software product had been written and by 1970 it was being vigorously marketed. That product, called Panvalet, has become a standard in program management, security and control, he said.

When Pansophic was formed — just prior to IBM's now-famous decision to "unhundle" and separately price its computer software and services from its computer hardware — it was initially engaged in consulting services, systems design and programming for firms in the Midwest. It had three computer software specialists and a small office just west of Chicago.

A great number of new firms appeared starting in 1969, since IBM's decision to unbundle provided the opportunity and the impetus for the emergence of a new subindustry of independent software suppliers.

The capital requirements were minimal. There was a vast opportunity available for the development of generalized computer software products which could be readily marketed to over 20,000 IBM computer users around the world.

The software industry has been volatile in the last eight years. Of the more than 700 software companies formed in 1969, only a handful are in business today, and only two are profitable, Piscopo said, noting Pansophic is one of the more profitable ones.

Sales Figures

"Pansophic reported a record $7.2 million in sales for the fiscal year ending April 30, 1977. This represents nearly a 45% increase over the previous fiscal period ending Apri 30, 1976," Piscopo said.

"Earnings for 1977 were 690% greater than for 1976. The major source of this increase was international sales, which increased approximately 80% over last year's figures.

"For the sixth year in a row, Pansophic paid $50,000 in dividends to shareholders," he added.

"We look for some reduction in overall processing costs resulting from hardware technology advance, coupled with a continued strong increase in user acceptance of packaged software," Piscopo continued.

"The software industry is maturing to the point where an ongoing research and devlopment effort will be sustained. We expect an explosion of innovative technological developments to occur over the next four to 10 years, particularly in systems software," he said.

Piscopo feels users can expect more variety of product offerings, improved reliability and flexibility, high performance and operating efficiency.

"Independent suppliers," he said, "will provide even more effective training, better documentation, and more capable product services and local support personnel to serve their users and support their products. Extended capabilities of improved features will be included in design consideration for future products."

Widely Used

Marketing of Panvalet in the U.S. began early in 1970 and expanded to worldwide markets in 1971. Today Panvalet is one of the most widely used software products ever developed.

In fact, at the recent international Computer Programs, Inc. (ICP) Million Dollar Awards in Chicago, Panvalet received awards for having sales over $10 million and having over 3,000 customers.

Pansophic acquired exlusive marketing rights in May 1973 to another product, Easytrieve, an information retrieval and file management system. Easytrieve has also been highly successful and received ICP awards for having sales totaling over $5 million and over 1,000 installations.

Pansophic has also developed Pan*Da, a disk analysis and data set management system providing large computer users with an effective tool for efficient management of magnetic disk storage devices. Total Pan*Da revenues to date exceed $200,000, with 200 installations.

Throughout its history, Pansophic has dedicated itself to market only software products of the greatest benefit to users and with high standards of technical excellence and reliability, Piscopo said.

The company has made a total commitment to support the needs of users through a high-caliber customer service staff, he indicated.

DP's Share of Health Insurance Dollars Seen Growing

By Toni Wiseman
Of the CW Staff

MENLO PARK, Calif. — Health is the third largest industry in the U.S., with 1976 expenditures of $140 billion and an additional $43 billion in federal expenditures, or 11.4% of the entire federal budget.

The data processing share of administrative costs ranges between 15% and 30%, yielding a commercial market for Medicare, Medicaid and Champus (a military payment system) of $292 million. Another $100 million is being spent in-house by the states and an additional $20 million goes for other expenses, according to a recent report by Input, Inc., a market research firm here.

This $412 million for fiscal 1976 does not include amounts spent by the federal government internally for DP, it added.

The report noted that the advent of National Health Insurance (NHI) could raise the federal expenditure forecast for 1980 by as much as 131%.

The Medicare, Medicaid and Champus programs are generally managed hy fiscal intermediaries, carriers and contractors, who subcontract DP activities to commercial vendors, Input said, citing California as an example. Maryland, it said, is an example of a contractor which does its own DP.

"The Blue Cross/Bluc Shield plans are the largest contractors, and Electronic Data Systems (EDS) is the largest DP subcontractor, with approximately $70 million in related revenues in 1976," the report stated.

The State of California, one of the largest beneficiaries of all three programs, contracts its $2.4 billion Medi-Cal program to a consortium of Blue Cross and Blue Shield plans in the state, the report said. The administrative portion of the contract is $43 million, of which EDS receives $13 million for DP and Blue Cross and Blue Shield retain $1.5 million for DP.

"The advent of NHI will cause considerable tremors through the existing Medicare and Medicaid systems and will result in DP expenditures in 1980 ranging between $667 million and $1.2 billion, depending on which NHI program is implemented," Input noted.

The report said the magnitude of the DP requirements for NHI are so great they will influence the way the NHI program is administered.

Processing Estimates

"System processing estimates carried out by one processing vendor currently operating under Medicare and Medicaid shows that an ultimate NHI would dwarf the size of the current Social Security processing resources, which themselves are among the largest in the country.

"NHI will create more DP dollar expenditures, greater standardization of functions, increasingly centralized control of decision-making and, because of the magnitude of even the smallest NHI proposal, will create a great demand for vendors with related capabilities and experience," Input stated.

Contracts will go to those vendors who are experienced in health insurance-related work, with an emphasis on turnkey experience, i.e., "the ability to provide the software and services related both to DP and to the allied administrative paperwork," the firm noted.

"Barriers to market entry, which can often be erected through proprietary software, will be less of a factor in the NHI environment for the first couple of years. This is because of the uncertainty, at this time, of the exact characteristics of the final legislation.

"HEW is most likely to take a model system approach with NHI. This method requires vendors who wish to obtain processing contracts to use software that conforms closely to the federal standards," Input said.

"One way for vendors to gain an early entry into the NHI world would be to participate in development of that model software," the report suggested.

Introducing the Model 770 Intelligent Terminal.

From the company that makes technology affordable.

TEXAS INSTRUMENTS.

The Model 770 Intelligent Terminal is a powerful system designed to meet your distributed processing needs. Better than sending your data to your host by mail or teletypewriter, better than entering it by keypunch or key-to-disc, the 770 provides the ideal, cost-effective solution for source data entry, data pre-processing and communications for your distributed processing applications.

Reduces your communications costs.
The Model 770 removes a substantial burden from your host computer and reduces your data communications costs. By pre-processing your data on the spot, errors are reduced, and speed and accuracy are increased. Additional communications savings can result by transmitting batched data at high speed during unattended operation when line rates are lower.

Totally integrated package.
The Model 770 terminal includes all the components of an entire system. It has features like dual mini-cartridge tapes, a 1920-character video display and up to 48K bytes of memory. And it's the first video display-based intelligent terminal on the market that offers a built-in 80-column printer.

For multi-copy and 132-column capability, TI's compact, microprocessor-based Model 810 impact printer is also available.

Model 810 Impact Printer

Easy-to-use software, easy-to-learn language.
Model 770 terminals are easy to program and operate with TPL 700, the flexible, powerful Terminal Programming Language. TPL 700 is a high-level business-oriented language that greatly simplifies forms generation and procedures for data entry and local processing. Programs can be developed interactively on the 770 without ever writing lines of code.

And, of course, TI offers total service and support, including flexible maintenance plans and a nationwide network of factory-trained customer service engineers. For your distributed processing needs, TI clearly has a better solution. For more information, mail back the coupon. Or call your nearest TI sales office or Terminal Systems Marketing, (713) 494-5115, ext. 3116.

Yes! I am interested in the Model 770 Intelligent Terminal.

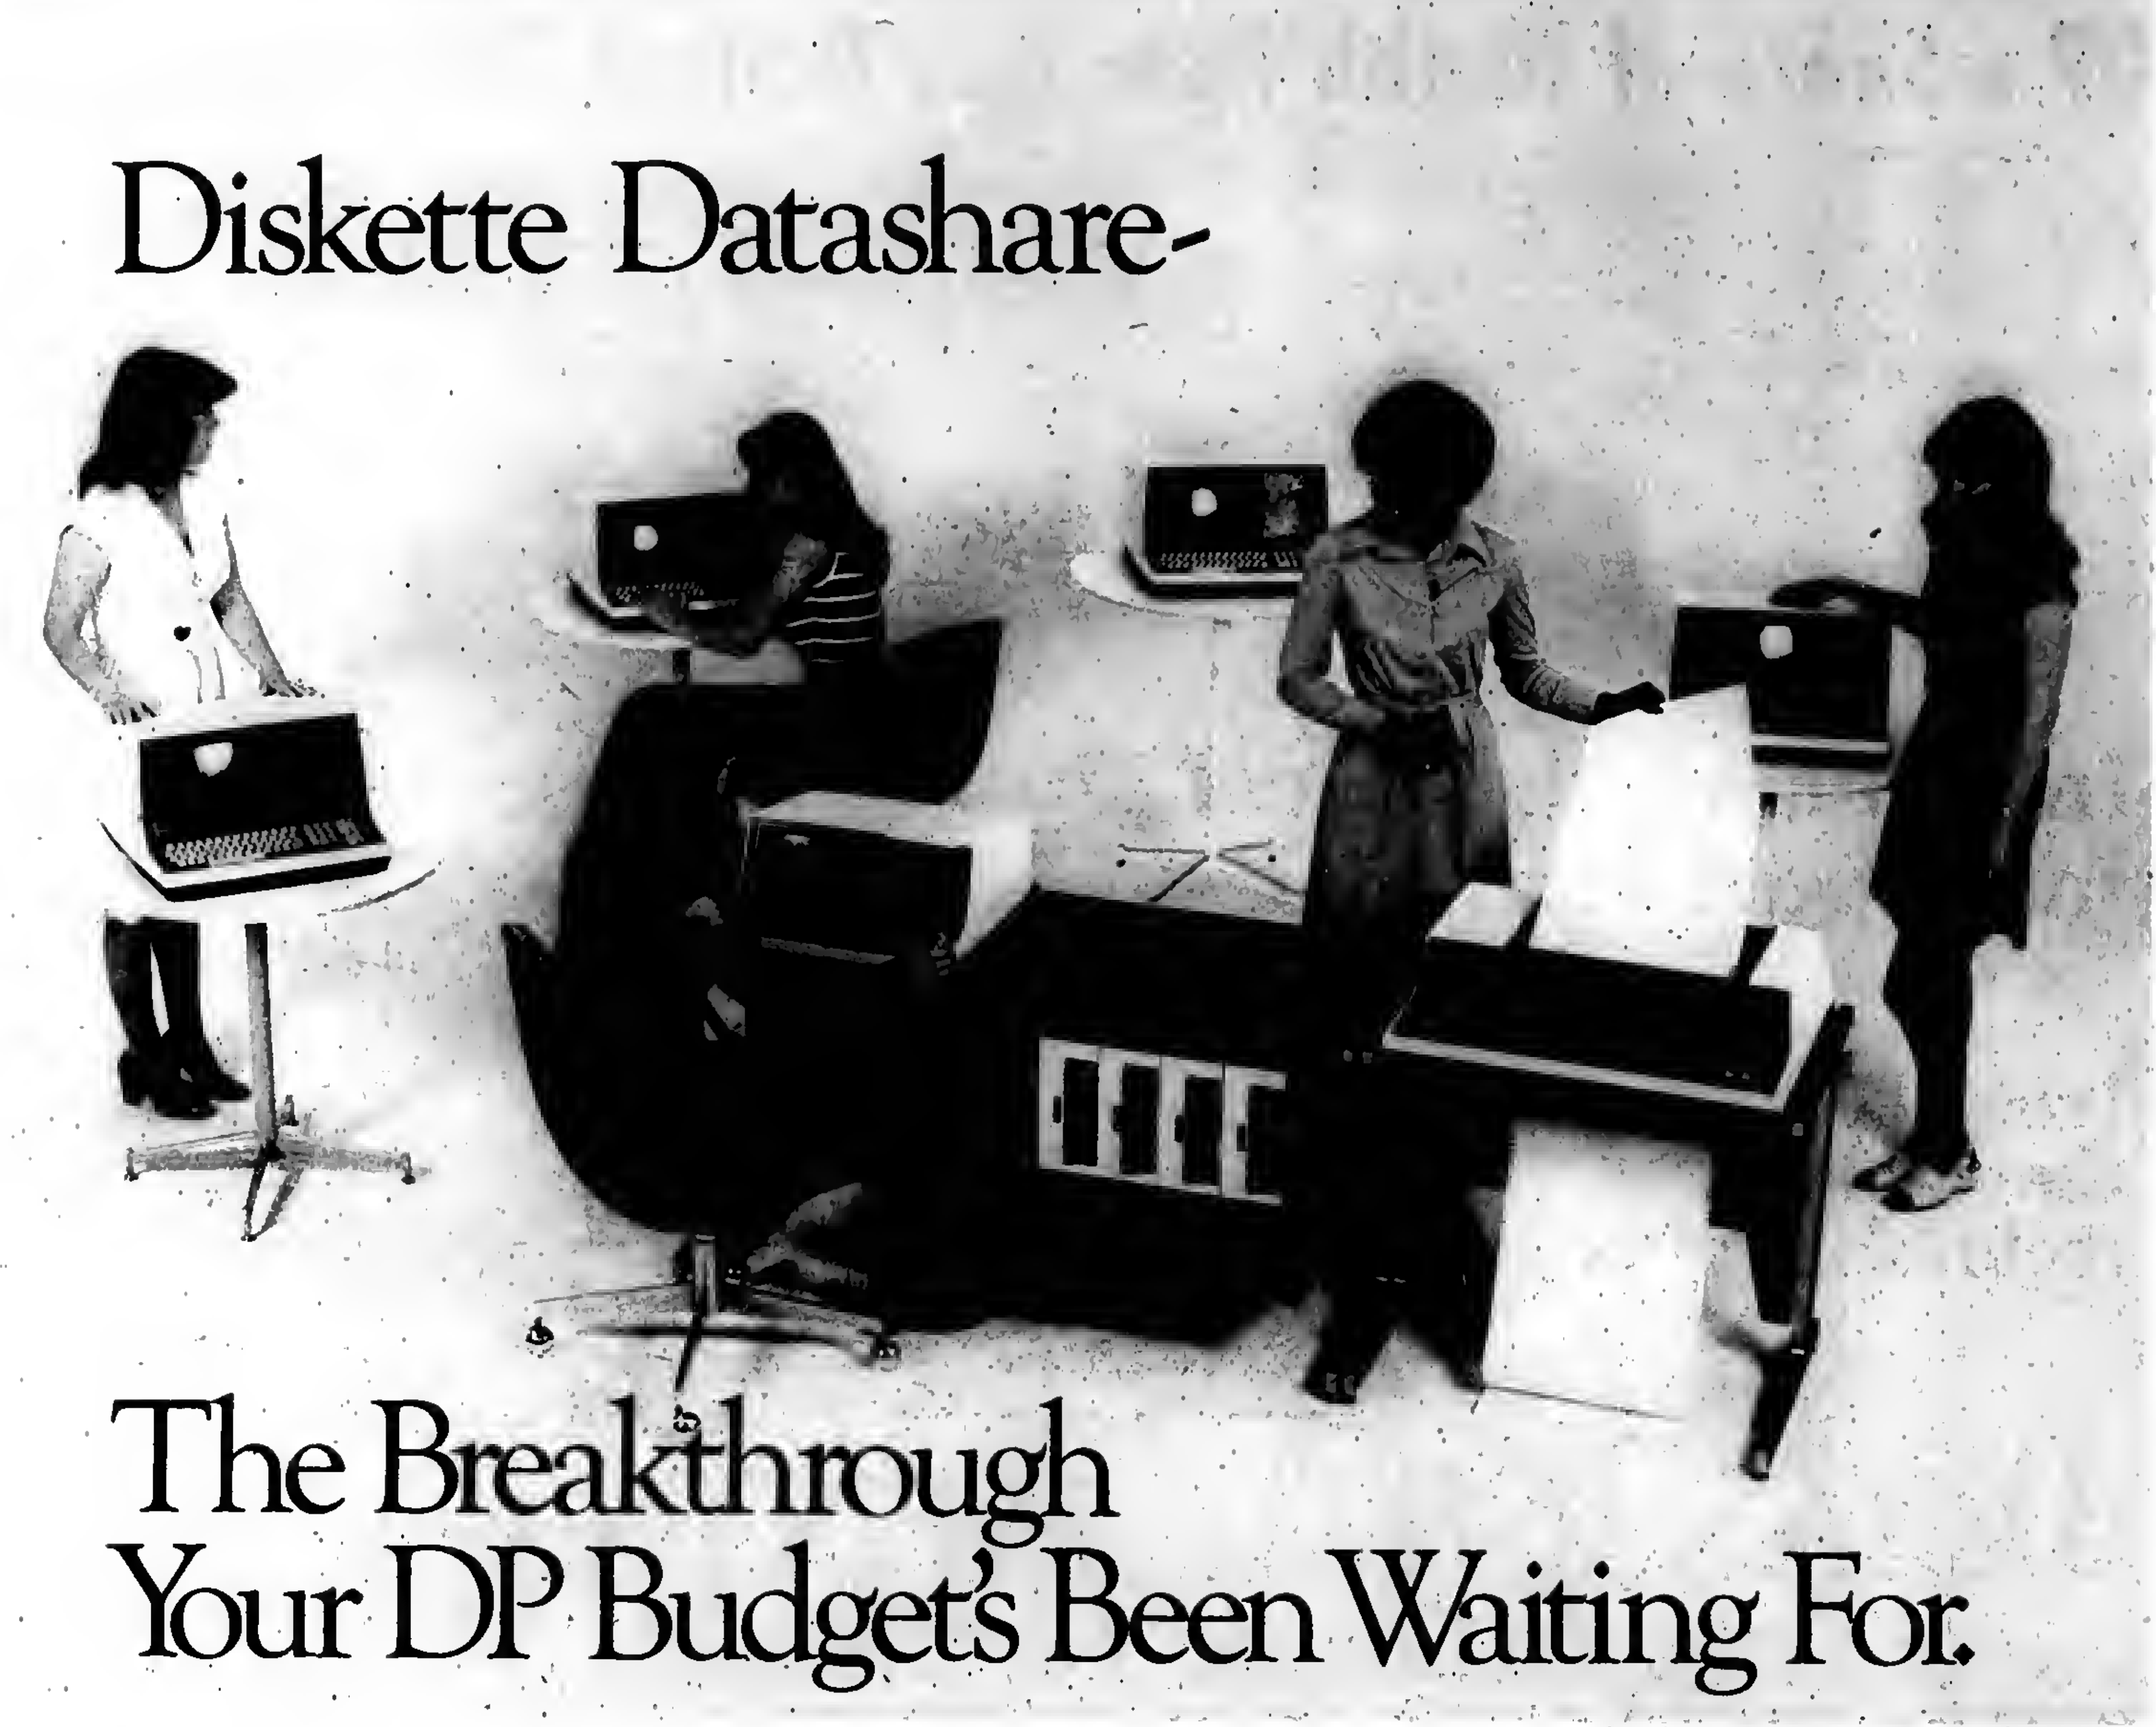
Diskette Datashare-



The Breakthrough Your DP Budget's Been Waiting For.

And waiting for. An inexpensive, multi-user system that increases your data processing capability without depleting your pocketbook.

Datapoint announces Diskette DATASHARE® — a new combination of hardware and software that features the power of our DATASHARE Business Timesharing System and the economy of a diskette-based processor.

With Diskette DATASHARE, you can implement a timesharing system with up to four concurrent users on individual 3600 Datastations. Based on the 48K Datapoint 1170 Dispersed Processor, the system uses advanced disk buffer management techniques to produce an astounding 32,000 bytes of virtual memory for each user. Data is stored on convenient diskettes using any of Datapoint's file access techniques, such as random-access or indexed-sequential. A total of one million bytes of on-line storage is provided.

What's more, Diskette DATASHARE contains the same versatile capabilities for external communications as the larger DATASHARE systems. Like DSNET,™ for remote disk file processing, and MULTILINK,™ for real-time telecommunications to a mainframe computer. So your Diskette DATASHARE system can become a node in a dispersed network as you grow.

And because all the members of Datapoint's family of hardware and software products are compatible, you can later upgrade your system without costly software revisions and retraining.

But the best news is the price. Now you can install a full, four-station DATASHARE capability for under $27,000, or $830 a month on a three-year lease (metro-area maintenance included). That's right — your DP budget can finally breathe easy. While your operations run more efficiently than ever.

Find out more about Diskette DATASHARE. Contact the Datapoint sales office nearest you, or write: Datapoint Corporation, Attention
Product Marketing,
9725 Datapoint Drive,
San Antonio,
Texas 78284

Plans Product 'Hierarchy'

CDC Continuing R&D on Mass Storage System

By Edith Holmes
Of the CW Staff

NEW YORK — Between $15 million and $20 million has already been spent by Control Data Corp. on its CDC 38500 mass storage system, and the research and development expenditures are continuing, according to Gordon Brown, CDC's vice-president for marketing and planning.

CDC expects mass storage systems to become commonplace and so plans to put the 38500 out through a series of product offerings over the next several years, Brown said here recently during his testimony as a U.S. government witness in the trial of the antitrust case against IBM.

The CDC executive described his corporation's plans in this area broadly — as a "hierarchy of products" with interrelationships and interdependence.

CDC expects its mass storage systems to satisfy three kinds of users: those with IBM systems, those with CDC systems and those who occupy the OEM marketplace.

The $15 million to $20 million to which Brown referred has been expended only to develop products related to the total 38500 configuration.

Brown estimated that the basic technology work done by CDC in the mass storage area cost between $3 million and $4 million. Research and development on Vdam — the software required by the system and consisting of staging packages designed to be used with a variety of mainframes — has eaten up approximately $6 million.

Some $7 million has gone into the creation of the 38500 hardware — the selector, cartridges and mass storage adapter, Brown said.

Another $2 million has been spent on enhancements to the CDC system, which currently has two users, and on follow-on versions of the mass storage device, he stated.

Much of the R&D cost for the system has been allocated to a CDC subsidiary, Computer Peripherals, Inc., which was formed in April 1972. As of October 1975, when his deposition in U.S. vs. IBM was taken, Brown said about $8 million of these costs had been deducted directly from CDC's accounts.

Unlike the creation of its disk products, CDC began development of the 38500 three years before IBM announced its product in this area in October 1974.

During the basic R&D period for the 38500 — between the middle of 1972 and late 1974 — CDC spent approximately $10 million on the system. In 1975, another $4 million was spent, and a similar amount was expended in 1976 on this project, Brown said.

CDC had its first 38500 user by September 1976, but the product has caught on slowly.

"Our expectations were that the IBM systems user would accept the mass storage concept earlier than he did," Brown said.

In addition, CDC expected to sell more mass storage devices in 1976 than it did, thus falling short of sales quotas for the 38500 last year.

Other peripherals sales made up for this short fall, causing CDC's overall market objective in the area for 1976 to be exceeded by 10%, he stated.

CDC's mass storage system incorporates technology significantly different from that employed by IBM's 3850 mass storage product, Brown indicated. There was some feeling in CDC that if IBM engineered its storage device one way, CDC should too — given the resources IBM can bring to bear on such projects.

Brown said he continues to believe, however, that the CDC line head recording technique is superior to anything IBM has developed in the mass storage area.

Survey Directory

FAIRFIELD, N.J. — Over 1,500 multiclient reports and syndicated services available from consulting firms are listed in the second edition of the *Directory of U.S. and Canadian Marketing Surveys and Services.*

The directory includes 125 consulting firms and both industrial and consumer marketing research companies as well as media research firms. The companies range in size from such international firms as IBM, A.D. Little, A.C. Nielsen and Stanford Research Institute to a number of one-man operations.

The directory lists about 50 surveys, including general market studies on computers and DP and such special reviews as computers in insurance, medicine and process industries; and minicomputers.

The directory is priced at $100 from C.H. Kline & Co., 330 Passaic Ave., Fairfield, N.J. 07006.

Testimony Reveals CDC's Plans

(Continued from Page 35)

compatible peripherals business, Brown said.

In the plug-compatible area, however, he said CDC's general plan is to "capitalize on any substitute business opportunities available."

Smaller Revenue Base

Greater growth can also be projected for peripheral systems because they comprise a smaller revenue base — $75 million compared with CDC's OEM revenue base in excess of $150 million, Brown added.

Continuing his explanation of the principle that it's easier to achieve more dramatic gains in small revenue base areas, Brown cited the small dollar values presently generated by the IPL Omega 480-1 and Omega 480-2 systems and by CDC's 38500 mass storage system. With virtually no dollars associated with either of these programs, CDC can expect a compound growth rate of approximately 30%.

In other words, he explained, you don't have to sell many peripherals systems which include the Omega and mass storage devices to reach a 20% growth rate of the $75 million revenue base; you just have to sell 36 or 40 of these systems each year, he suggested.

IBM does impact CDC's short- and long-term planning, Brown told the court. It is critical to CDC to evaluate where its products stand in relation to those of IBM, he stated.

The CDC vice-president identified three kinds of risks: marketing risks, or 'Can we sell the product we produce?'; technology risks, or "our own ability to complete all phases of research, development, manufacturing and start up costs"; and business risks.

Business risks are perhaps "the most critical" to the plug-compatible business, he said. These risks can include unforeseen product announcements, price cuts and the potential for subsystems to be rendered inoperable and/or incompatible by IBM actions in microcode encryption techniques.

osha?

A single employee OSHA claim could demand a staggering quantity of work-station and medical data, that old-style payroll/personnel systems cannot provide.

Wang has a software system for IBM/Burroughs/Honeywell/Univac systems that can handle this problem . . .

For more, call Joe Nestor (617) 851-4111, Wang Laboratories, Inc., Lowell, MA 01851. In California, call Carl Tarascio at (714) 631-0138.

WANG

SPLICE
THE AFFORDABLE COBOL PRECOMPILER
(IT'S ONLY 5K)

HIGHLITES:

- SPLICE is a COBOL precompiler which drastically reduces the initial coding of all COBOL programs 50-70%. With "quick and dirty" programs 80% reductions are possible. Your programmers codes in SPLICE and SPLICE then generates the COBOL program. SPLICE removes the drudgery of COBOL coding without sacrificing the extensive documentation which makes COBOL so popular.
- Mastering SPLICE is quick and easy. SPLICE is not a new language. If you can code COBOL, you can code SPLICE.
SPLICE is 100% compatible with COBOL. Its logic closely follows COBOL logic, SPLICE coding forms are identical, and all COBOL statements are acceptable by SPLICE.
- If you're starting to adhere to structured programming conventions here's what else SPLICE offers:
"alignment of IF/ELSE Code"
Responding to the increased interest in structured programming, SPLICE includes IF/ELSE alignment as part of its basic function. With this enhancement SPLICE will realign COBOL programs so the ELSE appears under the relevant IF according to compiler rather than programmer interpretation. In addition nested IF'S are successfully indented by four columns from the appropriate IF or ELSE.

ADDITIONAL SELECTABLE UNIT
STANDARDS MODULE = 1000.00

HIGHLITES:

This selectable unit promotes installation standards on both new and existing programs.

specific capabilities —

- Record prefixing of data division • Paragraph sequencing in procedure division • Conversion to standard forms and columns for usage, picture, and value clauses • Alphabetic listing of working storage entries • Replacement of non-descriptive data names with user defined expanded name • Insertion of EJECTS, SKIPS, and blank lines as desired • Ending or beginning lines upon encountering specified COBOL reserved word or punctuation.
- Splice is available for all IBM 360's, 370's, Univac Spectra series, and Univac 9000 series.
- User comments
  1. Jewel Foods — Tom McLain, Application Program Manager
  "I looked at every Cobol preprocessor on the market and chose Splice because it offers the best price performance ratio and my programming staff enjoys using it."
  2. Olin Corp. — Keith Sullivan, Manager/Systems Development
  "We have experienced a noticeable increase in programmer productivity since we began using Splice."
  3. Westchester Community College
  "Several dozen programs have been developed with SPLICE resulting in initial coding time savings in excess of 50%."

Medicine Seen Healthy Market for Peripherals

LOS ANGELES — As far as the computer industry is concerned, the prognosis for the medical equipment market is excellent, in one executive's opinion.

"The marriage of computer technology and medical science has really revolutionized health care in the United States," according to Ralph Gabai, division vice-president and general manager of the Pertec Division of Pertec Computer Corp.

Computerized office systems that allow doctors to have better access to their records, faster turnaround time on patient's bills and generally greater office efficiency is fast becoming commonplace, he noted.

"These are simply routine office functions," Gabai stated. "What is really exciting are the increasing number of applications that would have been impossible to achieve without a computer."

As an example, he cited Dr. Lewis C. Cook, an opthalmologist from Texarkana, Texas, who is developing a software package that will include data on patients' allergies to all medication related to eye surgery and eye diseases.

Using Tex-E-Comp's SBC, the basic system, called a 2050, includes a 16-bit CPU with up to one million bytes of directly accessible core; a 10M-byte Pertec D3000 disk drive, 5M bytes fixed and 5M bytes removable; a 120 char./line, 9x7 matrix impact printer with a capability of 60-150 line/min; and a 24-line, 80 char./line video display terminal.

Medical Office Tasks

In addition to this unique application the system handles all routine medical office tasks such as processing patient information, on-line posting of individual transactions and turnaround billing receipts, transaction history and daily proof reports. It also handles past due reports, invoicing, monthly billing statements and standard forms for Medicare, hospitals and the American Medical Association.

"Equally exciting in terms of unusual applications is the use of computers in connection with the rapidly growing medical diagnostic techniques called computerized tomography that reconstruct images of the inside of the body," Gabai stated.

Exotic applications aside, Gabai feels that the relationship between medicine and DP will be meaningful for all concerned — especially computer peripheral equipment manufacturers.

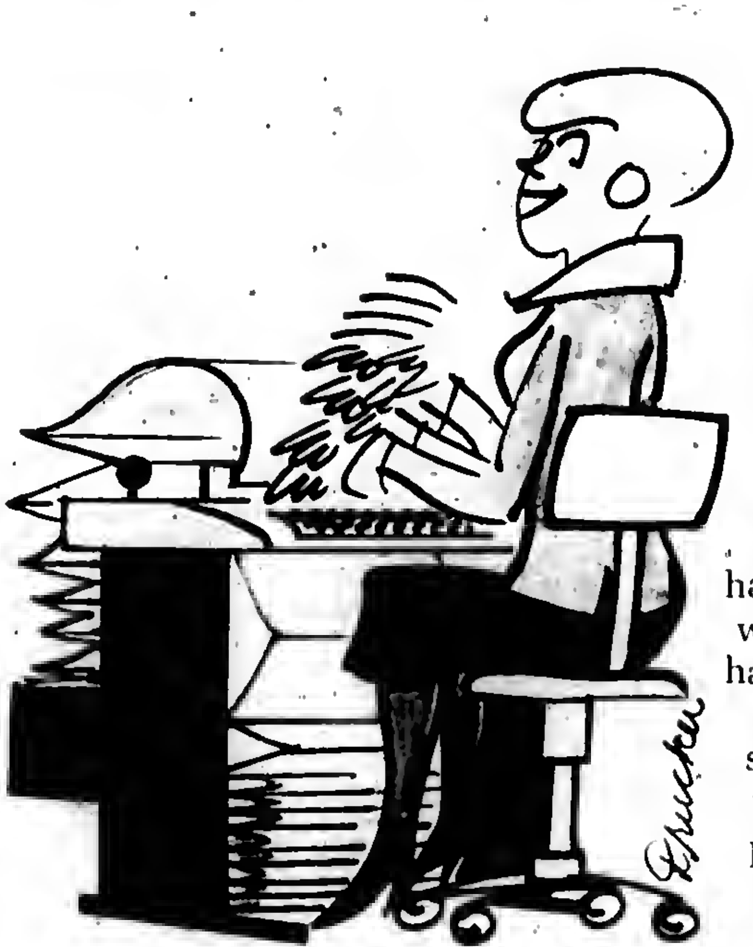
"Hospital administrators realize that the help of the computer industry will be essential to cut health care costs, expedite communications, tighten up financial systems and generally improve admissions procedures.

"Anyway you look at it, whether it's routine office functions or more esoteric applications like CT scanning, computer peripheral equipment will continue to have a very healthy marketplace in medicine because of the increased use of CRTs and terminals by hospitals," Gabai concluded.

Executive Corner

- The Burroughs Corp. board of directors has elected James C. Fletcher and Arthur R. Seder Jr. to the board and has also elected James A. McCullough executive vice-president, business machines group and J. Paul Leebrick Jr. a Burroughs vice-president.
- Richard J. Egan has been elected to Cambridge Memories, Inc.'s board of directors.
- John C. Lobb has been elected to the board of directors of Modular Computer Systems, Inc. (Modcomp).
- Glenn E. Penisten was elected chairman of the board and president of American Microsystems, Inc.
- William L. Miron, past corporate executive vice-president, director and member of the Office of Chief Executive for Bendix Corp., has accepted a seat on the Process Computer Systems, Inc. (PCS) board of directors.
- Dr. Lawrence M. Parks has been elected president of Commercial On-Line Systems Corp.
- Zach Lonstein has been elected president and chief operating officer of Transportation Computing Sciences Corp.
- Joseph L. Dionne has been named president of McGraw-Hill Information Systems Co., a division of McGraw-Hill, Inc.
- Robert D. Enochs has been named to head the new division for computer-output microfilm products as part of Bell & Howell Co.'s microimagery group.
- Gerard R. Gaudet has been named Dataproducts Inc.'s vice-president of operations for Sunnyvale, Calif. and Hong Kong.
- Sol Zasloff has been appointed vice-president of marketing for Micropolis Corp.
- H. Richard Seltzer was elected vice-president of ITT Domestic Transmission Systems, Inc., a subsidiary of International Telephone & Telegraph Corp.
- Joseph F. Bradley has been appointed vice-president, marketing, components division of Burndy Corp.

SORBUS SERVICE:



We don't blame you for being a true believer in the work-a-day wonders of your DECwriter II terminals. They're among the most versatile, reliable printers around.

The trouble is, you don't always appreciate your DECwriters until they go down. And then, unfortunately, the service people sometimes give you as much as three days to learn how much you miss them.

New, fast-acting cure for DECwriter's cramp.

We service your hardware because we want to. Not because we have to. So we move out quickly with parts—and smarts—whenever, wherever you call.

Not all of our key-city offices have resident DECwriter specialists yet, but we're expanding quickly. Drop us a line: The coupon below will bring help.

We happen to believe that the best DECwriter is a working DECwriter. And we're now in a position to do something about it.

We're SORBUS. We already service more pieces of hardware (60,000), in more user locations (16,000) than any other company in our business.

And now we're putting DECwriter II on the long list of hardware we can service for you.

So that when your DECwriter goes down, you'll know that a single call to SORBUS will bring help fast. You won't have to stand in line behind an ailing computer.

☐ Please send me more information about your DECwriter II service.
☐ Tell one of your uptime insurance people to call me for an appointment.

POSITION ANNOUNCEMENTS

SCIENTIFIC PROGRAMMERS

Weston, one of the nation's top environmental consulting firms, offers an exceptional growth opportunity for an individual with 2-3 years technical programming experience. Prefer mini computer experience with Hewlett Packard equipment and plotting experience using CALCOMP or Tektronis. FORTRAN with some Assembler language desired. Candidate must have excellent skills and be willing to travel first 6 months of employment.

If you are currently employed and are ready to make a move which will further your career and broaden your experience, this is the perfect opportunity. Qualified applicants are requested to submit resume including salary requirements, to: J. Pavletich

ROY F. WESTON, INC.
Weston Way, West Chester, Pa. 19380

WESTON

An Affirmative Action Employer Male/Female/Handicapped

SOFTWARE

Our client, a leader in the development and manufacture of intelligent computer display terminals, and other mini/microcomputer b sed systems, is currently searching for two project leaders.

OPERATING SYSTEMS DEVELOPMENT TO 27k

The position responsibilities are to lead a group of software engineers in the designing, coding, and testing of a State-Of-The-Art Mini-Computer Operating System. This person should have had experience leading or participating in a team which actually built an operating system. The candidate should be able to put together non-trivial systems in an elegant and simple manner (as opposed to non-maintainable complex systems), and should be a strong take charge professional who thrives on seeing reality destroy the aestetics of theory.

APPLICATIONS SUPPORT MGR. TO 30k

This is a multi-dimensional position with a bottom line of programmer productivity. The responsibilities of the job include overseeing the specification and construction of application support tools from memory dumps to data base, and overseeing the development and execution of programming methodology. This position requires a person with broad experience and an ability to advise the company concerning the uses and misuses of data base. Experience with end users, distributive processing, minicomputers and/or intelligent terminals a plus.

LARGE SCALE COMPUTER SYSTEMS REPRESENTATIVE

Honeywell's Series 60, Level 66, is more than a new generation . . .

It's a new family . . . a totally new information processing system employing advanced technology that will remain State-of-the-Art into the future. To the large business applications user, it's a system that can handle today's needs more efficiently with the capability of responding to the demands of the future.

Working with other Honeywell technical specialists, you will represent Honeywell at customer sites with State-of-the-Art Level 66 installations. A minimum of two years experience in a large-scale environment is required. Knowledge of GCOS internals is highly desirable.

The large scale market is a new ball game. Talk with us about joining the team. We offer a top-of-the-industry salary and benefit package, plus extras. Call or write:

Hal McCornec/Al Irwin
(201) 635-1600

PROGRAMMERS

The growth of our company has created several openings in our Pittsburgh headquarters office.

Applications Programmer

The individual we are seeking should have an associate degree or equivalent and a minimum of two to three years' experience in programming on IBM 360 or 370 computers with manufacturing and/or financial applications. Proficiency in COBOL language and 360 and 370 OS or DOS equipment is also necessary. RJE experience preferred.

Analyst/Programmers

The ideal candidate for this position must have demonstrated proficiency in manufacturing-related systems design, programming and implementation; such as factory cost accounting, M.R.P. inventory control, and scheduling. Must be skilled in COBOL and familiar with large scale computer terminals as well as programming languages using DOS/OS equipment. An applicable Bachelor's degree plus three years' experience in programming is required.

If you feel you are qualified for one of these positions, send your resume including salary history to:

Opportunities In Central Engineering

Compiler Development

Digital's Central Engineering organization is a dynamic, challenging environment. We're currently involved in major Compiler Development projects and are seeking additional professionals who can make significant contributions.

Supervisor

Working with extremely intelligent peers as part of our Commercials Software Systems group, our largest and fastest growing organization, you'll be responsible for the development of BASIC language processors for multiple machine architectures. You must have solid project leadership experience, compiler design and development experience, and a knowledge of BASIC, PL-1 and FORTRAN languages would be a definite asset. BS/CS in Computer Science or related disciplines preferred.

Senior Software Engineers

These positions require mini-computer programming experience preferably on a PDP-11 with BASIC Plus. You should also have a strong interest in compiler development and be motivated to succeed in a fast-paced environment. 2-5 years experience plus a BS/MS in Computer Science or aquivalent is preferred.

Record and File Management Systems Programmers

We're seeking innovative programmers to design and implement record and file management systems, working with talented peers in an unstructured, positive atmosphere. A background in record and file design and assembly language programming is required, and a BS/MS in Computer Science or equivalent plus 2-5 years experience would be ideal. Experience with RSTS/E, RSX-11M or related mini-computer systems is a definite plus and a knowledge of BLISS programming is an asset.

To investigate these opportunities with one of the world's largest and fastest growing computer manufacturers, please send your resume to Joe Hart, Digital Equipment Corporation, Dept. B718, 162 Main Street, Maynard, Mass. 01754.

We're the company looking for people.

field engineering

A Very Good Year for Us. A Better One for You?

Most computer professionals are aware that today's most advanced large-system technology was developed by a company that, not too long ago, was virtually unknown.

Now the phenomenon is widely known. Amdahl's 470V/6 performs as promised. And the company performs as promised: our hardware and software support exceeds the established standards.

Not well known, however, is that this major supplier of large systems is still, in terms of staff size, relatively small. At Amdahl, you're not lost in a sea of people: we began 1976 with less than 400 people and ended it with less than 800. There's still room on the ground floor.

We're looking for above-average talent. You can expect an above-average compensation and benefits package. Please direct your response to Employment Manager, Amdahl Corporation, 1250 East Arques Avenue, Sunnyvale, CA 94086. We are, of course, an equal opportunity employer.

Immediate openings throughout the U.S. and Canada. Field candidates will undergo a training period in California on full salary with housing, transportation, and other expenses provided.

FIELD ENGINEERING SPECIALISTS

You will have a minimum of 5 years' experience in maintaining large-scale systems with in-depth training on compatible CPUs. You will have company support in assisting the Amdahl customer in his mixed-vendor environment to maintain full operations in his center. Openings in several major cities and at Amdahl headquarters in California. Please indicate 560-E on your response.

FIELD ENGINEERS

You will carry the Amdahl philosophy of customer service as well as your expertise into the field, utilizing your initiative and talents to aid the customer in restoring computer center operations regardless of the origin of the failure. Large system experience essential, preferably on compatible equipment. Please indicate 567-3E on your response and direct it to the Amdahl regional office nearest you as shown below.

SYNCHRONOUS SERVICE PRODUCT MANAGER

Be a WORKING MANAGER. We seek a highly motivated individual capable of interfacing with customers, marketing personnel, vendors, senior level engineers, analysts and top management — often all at the same time. Ability to do five things at once and come back looking for more. Candidates must have a minimum of three years systems experience on IBM mainframe, and systems or applications level experience with asynchronous and synchronous communications.

These positions provide excellent salaries, benefits and growth potential. Send resume to B.J. Eiler, Director of Personnel.

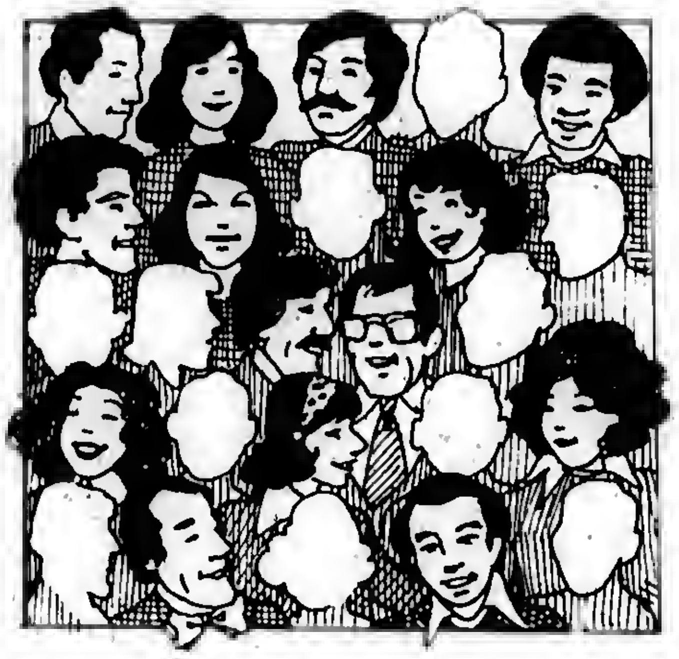
An equal opportunity employer m/f

Fourteen of our top twenty-five Sales Engineers never sold computers before they came to Data General.



They were Software Support Engineers, Customer Engineers, Systems Programmers, Hardware Designers...you name it.

The point is this: You can stick to your job for the next 18 months, or become a Sales Engineer at Data General, sell computers for a year — and you'll make the same money. Or more. You already have the technical credentials and, if you enjoy dealing with people and working in a competitive environment, there's no limit to what you can earn as a Sales Engineer at Data General.

We give you more of what you need to be successful: computers, peripherals, technology, reputation, position — over 39,000 Data General computers have been sold and installed in 33 countries around the world. Stay where you are, or move up to Data General — it's your future.

Computer Sales Engineers

We require solid technical background in mainframes, minis or systems — plus the ability to open up new OEM and end user accounts is a must.

New positions are available in the following locations:

EASTERN REGION

Maine
Boston
Connecticut
New York City

Rochester
Buffalo
New Jersey
Philadelphia
Baltimore
Washington
Richmond, VA
West Virginia
Miami
Orlando
Baton Rouge
Memphis
Little Rock
Houston
Charleston, WV

To apply for a position in any of the above locations call Charley Polachi at (800) 225-7346 or send him your business card with your home phone number on it to Data General Corporation, 15 Turnpike Rd., Westboro, MA 01581.

WESTERN REGION

El Segundo
Santa Ana
Palo Alto
Seattle
Sacramento
Phoenix
Van Nuys
San Francisco
Denver,
Fresno.

To apply for a position in any of the above cities call Terri Johnson collect at (408) 739-9200 or send her your business card with your home phone number on it to Data General Corporation, 433 N. Mathilda Ave., Sunnyvale, CA 94086.

MIDWEST REGION

Des Moines
Detroit
Louisville
Chicago
Pittsburgh
Omaha
Indianapolis

To apply for a position in any of the above cities call Yvette Britt collect at (312) 885-0505 or send her your business card with your home phone number on it to Data General Corporation, 1111 Plaza Drive, Schaumburg, IL 60172.

CANADA

Vancouver
Calgary
Toronto
Montreal
Edmonton
Winnipeg
Ottawa

To apply for a position in any of the above locations call Dale Malpass collect at (416) 259-4271 or send her your business card with your home phone number on it to Data General, Ltd., 415 Horner Rd., Toronto, Ontario M8W 4W3.

We also have openings for Systems Engineers in all of the above-mentioned locations.

Data General

An equal opportunity employer M/F.

Amdahl interviewing in Boston, Minneapolis, and Washington D.C.

Amdahl Corporation, manufacturer of the well-received 470V/6 computer system, has met the challenge of designing and building a new generation of large computers. Although the past year has seen us grow, there's still room on the ground floor for individuals who seek a challenging and friendly environment. Our benefits package is excellent and you'll be well-compensated for your efforts. Following are some of our more immediate needs. If you're a qualified candidate, perhaps the opportunity you desire is here . . . at Amdahl.

DIAGNOSTIC ENGINEERS

High level languages, logic design. Design and develop advanced diagnostics.

DESIGN AUTOMATION ENGINEERS

Language design, data base, design verification, test generation, physical packaging, routing.

DIAGNOSTICS QA ENGINEERS

Software QA, high level and assembly language, logic design and computer organization.

SOFTWARE ENGINEERS

Mini-computer real time O/S, multiprocessing and large systems. Or configuration management in code control or file control systems.

Amdahl engineers will interview in Boston, Minneapolis and Washington D.C. on Sunday, July 24 and Monday, July 25.

Qualified professionals are invited to schedule an interview. Send your resume to Chacko Neroth, Amdahl Corporation, 1250 East Arques Avenue, P. O. Box 5070, Sunnyvale, California 94086. We are, of course, an equal opportunity employer.

Teacher

Electronic Data Processing

Waupun State Prison

Wisconsin's progressive approach to solving key social issues within the State has created a need to attract talented and dedicated professionals.

We are presently seeking an individual to assume instructional responsibilities in electronic data processing. The position is based at the Wisconsin State Prison, Waupun, a maximum secruity institution for adult male residents.

Primary duties will involve comprehensive instruction in all aspects of computer programming, evaluation of existing teaching procedures and programs plus the establishment of a placement program for post-release employment of residents.

Qualifications require a Bachelors degree plus 2 years' data processing experience or 7 years' verifiable DP experience to be eligible for the State Board of Vocational, Technical, and Adult Education certification. Starting pay is approximately $933.00—$1,475.00 a month depending on qualifications. For an appointment and further information, please contact:

Mr. Glenn Weeks, Personnel Manager, Waupun State Prison, Waupun, WI 53963—(414) 324-5571. Applications or resumes must be received by July 29th, 1977. An Equal Opportunity Employer functioning under an Affirmative Action Plan.

EDP POSITIONS

The Computer Systems Division of Harris Corporation has expansion positions available in our Ft. Lauderdale, Florida, location. These positions are growth oriented and center around the manufacture, development and sale of our medium-scale digital computer system:

PRODUCT MARKETING MANAGER S100-S200 SYSTEMS

A senior marketing position to direct market penetration and product development of primary Harris Computer Systems Division product lines and related systems. Previous hardware sales experience and plannning relative to marketing systems are required.

SOFTWARE INSTRUCTORS

Will develop and present software training courses. Two years' minimum programming experience and communications skills are necessary. Desirable applicants should have operating systems, language processors and data base background. Will be responsible for documentation and will teach course offerings. 25% travel required.

MARKETING COMMUNICATIONS SPECIALIST

Must have a minimum of 3-5 years' experience in the data processing community with emphasis upon public relations, technical EDP communications (both written and verbal, planning, researching and preparing press oriented programs. Additional responsibilities will include preparation of application briefs and bulletins plus technical articles for presentation. A degree in Journalism or English is preferred.

DESIGN AUTOMATION PROGRAMMER

Must have a bachelor's degree. In addition, we prefer a candidate with 3-5 years' experience in the electronic manufacturing field. Experience should also include the analysis and programming of placement, routing and evaluation of inter-connection design problems.

DIAGNOSTIC ENGINEERS

A minimum of 2 years' experience required in hardware evaluation, design, coding, debugging, documentation and release of faulty detection and isolation software. BSEE or computer sciences.

TEST ENGINEER

Will develop test programs at printed circuit assembly test level and test procedures for subassemblies and peripheral equipment. BSEE plus 2 years' experience in computer circuitry and hardware testing.

TECH WRITERS

Positions available for both hardware and software development technical writers. Technical degree or English preferred.

Send your resume and salary history in confidence or call W.D. Taylor, Harris Corporation, Computer Systems Division, 1200 Gateway Drive, Ft. Lauderdale, Florida 33309. (305) 974-1700.

Drexel Burnham Lambert
INCORPORATED

Computer System & Software Engineers

You can get ahead faster with us than with anybody else.

Here's why:

1 You are needed right now. Our project teams are crying for good professionals who can grab hold fast.

2 You'll get a chance to prove how good you are. Everybody is evaluated regularly; there are no missing persons at TI. If you're good, you move up fast. No matter how long the people above you have been there.

3 You'll be involved in state-of-the-art projects. Air Traffic Control. Satellite navigation systems. Landing systems. Radar and infra-red sensor systems. Computer-aided design, manufacturing and electrical test systems, machine tool control, text processing and process control. Acoustic data and image processing. In addition, an Advanced Software Technology Department has been formed to develop state-of-the-art tools, procedures, and languages for computer system design and software production. TI is the technological leader in literally scores of product fields. This leadership has produced more than 5,000 patents.

4 You'll work on a complete system. No threat of getting locked into a repetitious specialty. You'll work on a small project team. You'll interface daily with other disciplines and other phases of your overall program.

5 You'll work in a job-stable, multi-market situation. We have a variety of products and markets. We're not heavily dependent on any one of them — and neither is your job.

Entry Level or Experienced Openings for U.S. Citizens

Software System Designer

CALL COLLECT Mr. Dick Royal (408) 446-6672

TYMSHARE INC.
10231 Bubb Road
Cupertino, CA. 95014
an equal opportunity employer m/f

A great measure of our success is the result of the professional EDP team we have. As we grow, we continue to need more talented individuals to grow along with us. Right now we're looking for top notch —

SOFTWARE SPECIALISTS

who are interested in working in the most sophisticated EDP environment in South Florida.

To qualify, you should possess a minimum of 1 year's experience in SVS/MVS SYSGEN and maintenance. Background in IMSGEN TSO LIBRARIAN TCAM and TMS would be highly desirable, but is not mandatory. In addition, you should be knowledgeable with applications of PTF's and APAR fixes using SMP.

You'll be playing an integral role in a conversion to MVS and system tuning as well as providing a stable data processing environment.

We offer an excellent salary and benefits package, outstanding growth potential, and a congenial, professional working environment. To apply, send your confidential resume with salary history/requirements in confidence to: N.P. FISCHLER, Manager of Employment.

ACCOUNTING SOFTWARE FOR DEC RSTS/E CTS-500 USERS

From one of the pioneers in commercial data processing using RSTS. Successful installations in manufacturing, distribution, service bureau uses. Completely on-line, interactive systems. If you are installing or have installed a RSTS/E or CTS-500 system, contact us first for cost-effective solutions in: ACCOUNTS PAYABLE; GENERAL LEDGER; FINANCIAL REPORTING

The design specifications for these packages were developed by accountants for use by accountants. All packages provide excellent audit-trail, extensive user prompting, fast data entry, full file-maintenance and inquiry capabilities, modular design and construction.

These are consolidating packages and support multi-division company and multi-company corporate accounting functions.

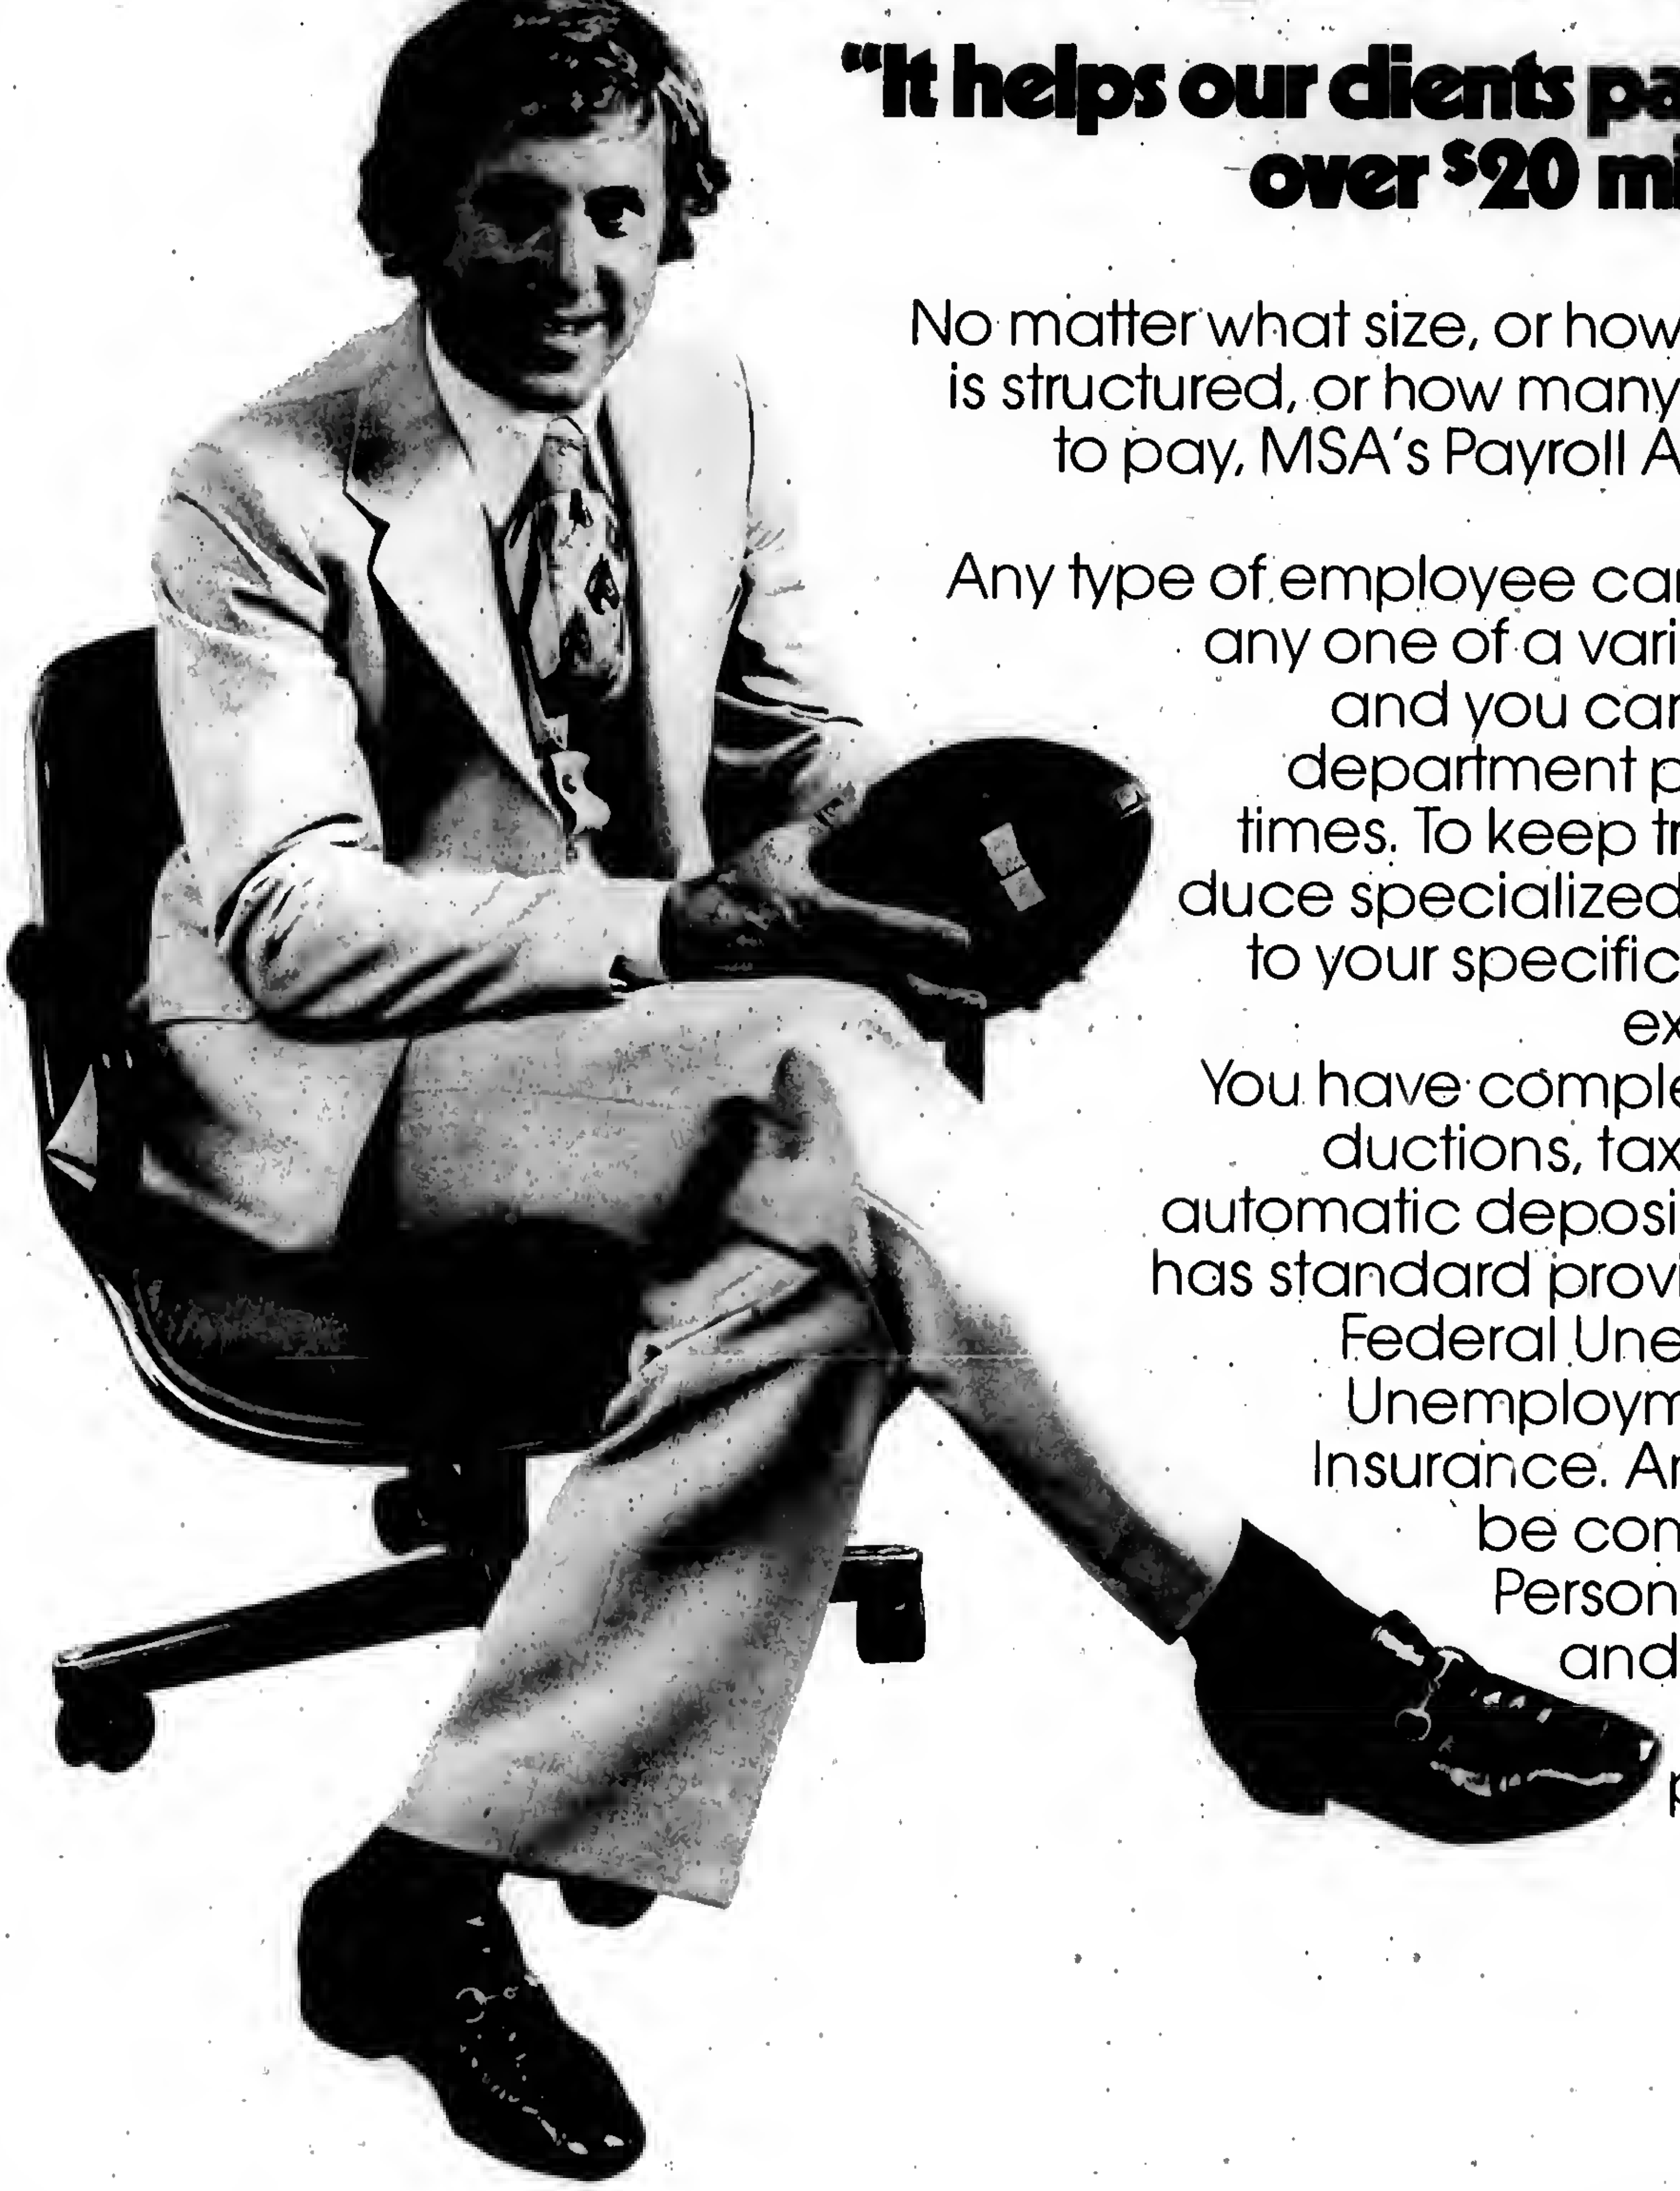
"Check the Scouting Report on MSA's Payroll System."



"It helps our clients pay employees over $20 million an hour."

Francis Tarkenton, MSA

No matter what size, or how your organization is structured, or how many payrolls you have to pay, MSA's Payroll Accounting System can handle it.

Any type of employee can be paid through any one of a variety of pay periods and you can process different department payrolls at different times. To keep track, you can produce specialized reports designed to your specifications without any extra programming.

You have complete flexibility in deductions, tax withholdings and automatic deposits. The system also has standard provisions for handling Federal Unemployment, State Unemployment and Disability Insurance. And this system can be combined with MSA's Personnel Management and Reporting System to provide improved employer-employee relationships.

Member SIA Software Industry Association

If you're scouting for a more effective, timely and accurate way to handle your organization's payroll, call Marge Kimbrough at (404) 262-2376 or mail this coupon.

The System That Wasn't

. Drake Lundell Jr.
Of the CW Staff

NEWTON, Mass. – Users got a glimpse at what may be Itel's next entry into the IBM-compatible CPU field through an ad the firm placed in *Computerworld* last week.

But the ad ran by mistake, Dick Grove, Itel's advertising manager, said, "and not through any fault of *Computerworld*."

Now the firm won't confirm anything that was in the ad, according to Richard H. Lussier, president of Itel's Data Products Group.

"The product we will announce, when we are ready, may be that or it may be dramatically different from that. The ad was one of several we were considering that vary in appearance and content, and it shows just one possible variation of what we may announce," Lussier said.

The ad ran as a result of a "communications problem" in the media department of the advertising agency that handles the Itel account, he added.

The firm had recently announced it plans to offer additional IBM-compatible CPUs and these CPUs will be built for Itel by Japan's Hitachi. However, Itel refused at that time to give any details of the proposed offerings [CW, July 18].

The inadvertent ad described a system called the Advanced System/6 (AS/6), said to be equivalent to the IBM 370/168-3 but priced $1 million less. It was also said to be three or four times more powerful than the Itel AS/5.

In addition, the system was said to take half the floor space of the 168 and to be air-cooled so it did not need the "intricate" water-cooling systems required by the IBM CPUs.

Although Itel said last week it would announce its plans for additions to the AS family in "the near future," apparently this may not be one of the offerings, since the firm has disavowed the ad.

What many observers expect is that Itel will wait until IBM announces its long-expected 3032 CPU, which would be an upgrade to the 370/158 in the same way

Carter Revamp Plan Eyed As Threat to OTP Visibility

By Edith Holmes
Of the CW Staff

WASHINGTON, D.C. – President Carter's reorganization plan that would move the Office of Telecommunications Policy (OTP) out of its place of prominence in the White House and into the Department of Commerce has met with skepticism on Capitol Hill.

Sent to the Congress just over a week ago, the President's "Reorganization Plan No. 1 of 1977" would discontinue OTP as part of the executive office of the President. The plan would retain a small telecommunications staff – as part of what would be called the Domestic Policy Staff – to brief Carter on any significant national communications and information questions that arise.

The chairmen of the Senate and House Subcommittees on Communications are concerned that national information policy issues – such as electronic mail, electronic fund transfers and a revision of the communications laws – could lose their visibility under the Presidential plan, which would create an Assistant Secretary for Communications and Information within the Commerce Department.

Accordingly, Sen. Ernest Hollings (D-S.C.) and Rep. Lionel Van Deerlin (D-Calif.) may offer legislation that would establish a full-blown agency or administration devoted to telecommunications and information policy if they aren't satisfied within the next month that OTP's present status won't be downgraded by the move, a spokeswoman for the Senate subcommittee said.

The staff remaining in the White House structure would number less than six, according to a spokesman with the President's Reorganization Office.

The Office of Management and Budget (OMB) would receive all the OTP functions relating to the management of government communications and the arbitration of interagency disputes regarding frequency allocation, he said.

OMB would also be in charge of establishing telecommunications procurement policy for the federal agencies, the spokesman noted, suggesting the General Services Administration (GSA) would play a lesser role in this area.

"All other functions except developing Presidential policy options would be transferred to a new office within the Department of Commerce, headed by a

Not a Real Catastrophe

N.Y. Users Find Blackout Only a Nuisance

CW Staff Round-Up

New York's DP centers appear to have come through the recent blackout virtually unscathed.

Computer technology has apparently progressed to the point where even a major power failure is more of a nuisance than a catastrophe. In fact, many users expressed surprise at the ease and speed with which they were able to bring their systems back up after power was restored.

The major problem in most centers hit by the blackout [CW, July 18] seemed to be the backlog of work that resulted in people working extra shifts.

An IBM spokesman said his firm experienced a definite increase in service calls through the weekend after the blackout, but he could not estimate a percentage increase directly attributable to the blackout.

"Our customers were overall understanding of the situation and customer reaction was good," he said, noting that the lack of disaster stories is perhaps a result of the fact that users are well prepared for any eventuality.

A random survey of large systems users in New York revealed a surprisingly low level of frustration and a noticeable level of satisfaction with DP's ability to survive acts of God or man.

In some cases, uninterruptible power supply (UPS) systems were credited with saving a center.

The data center at Merrill Lynch, Pierce, Fenner & Smith, Inc., for example, experienced "no delay in processing" during the blackout thanks to the firm's UPS, according to Ted Vande Woude, vice-president of computer services.

"Merrill Lynch ran the whole time," he added, and even took on some work of those shops that were affected by the disaster. The brokerage house, which has three IBM 370/168s and one IBM 370/155 at its main data center, ran for "27 hours with turbines charging the batteries."

The shop has been "well-prepared for this for the last five years," Vande Woude noted, adding the regular Consolidated Edison power supply is "very poor."

"So many data centers spend a lot of time every year trying to justify spending money on a UPS system," he said, but "one incident like this pays for the expense of preparing a shop" for this kind of disaster.

Hero of the Day

In most cases, however, the hero of the day was the "power off" button that prevented damage to CPUs and disk and tape drives once the power surged back on.

The Bowne Time Sharing network headquartered in New York was out of operation for 24 hours. Minutes before power was lost, operators in the DP center noticed the lights beginning to dim and promptly pushed the stop button on the firm's dual 370/155.

Shortly thereafter, all power to the center was lost, according to vice-president Dave Herr. When power was restored about 9:30 p.m. the next evening, every piece of equipment came back on without damage. This included IBM 3330-type disks and 1270 communications front ends from Memorex Corp.

"Our only residual problem was with New York Telephone," Herr reported, because it needed power to run the pumps that keep water out of its cables. The pumps used to keep phone cables dry

Users Plan to Battle Bell Bill, Fear End to Freedom of Choice

By Ronald A. Frank
Of the CW Staff

SAN FRANCISCO – Members of one of the nation's largest telecommunications user groups have voted to oppose the AT&T-fostered Consumer Communications Reform Act on grounds that it would reduce competition and limit users' freedom of choice.

The Tele-Communications Association (TCA) recently voted and put into resolution form its decision to "oppose enactment of the Consumer Communications Reform Act of 1977 in the versions submitted to date."

The TCA position was also included in a resolution that affirmed the "policy of continued competition in the private-line and telephone terminal equipment" areas. It stated further that "competition has encouraged innovation . . . and has resulted in new product offerings by all suppliers."

The TCA resolution and a supporting position paper were approved recently by a two-thirds majority of members voting on the issue. Robert Barnwell, president of TCA and corporate manager of office services at Fibre Board Corp., said he could not divulge the number of members who participated in the vote on the resolution.

TCA currently has 330 member companies with about 674 individual memberships, he said.

The TCA stand on a major national issue such as the Reform Act is considered especially significant by industry observers because most user organizations in the telecommunications area specifically forbid public statements as part of their

No Business For Fraud Squad

By Catherine Arnst
Of the CW Staff

TALLAHASSEE, Fla. A special police unit organized here a year ago to train police in DP crime detection has yet to train anyone because of a lack of interest from the business community.

"Computer crime is something the business community would rather not address unless something really happens," according to Robert Martindell, a special agent with the Florida Department of Criminal Law Enforcement's Strategic Investigators Unit.

The computer crime unit is part of a white-collar division of the Department of Criminal Law Enforcement, which has statewide police powers. Martindell, who was in DP for 12 years before turning to law enforcement is the only agent with any experience in the computer field. There are five agents in the white-collar crime division.

The program was set up in August 1976, but no guidelines have been established because there are no particular cases on which to base them, Martindell said. "No one is reporting any cases due to lack of interest," he added.

Martindell has given three speeches

Blackout a Nuisance, Not a Catastrophe

(Continued from Page 1)

were not operating and, as a result, cables running to the DP center were out of service until the following Monday.

Nothing was powered down when the failure came, so everything "went down hard," but there was no permanent damage to the hardware. The CPUs were stopped but still powered up after the crisis was over.

Asked about installing backup systems now, Herr said it would be very difficult. "From what we've seen, we'd have to power the entire building" to stay in operation, he said.

No Warning

At Gimbel Brothers, Inc., DP employees on-site at the time of the blackout calmly inactivated their 370/145 and manually rewound the tapes which had stopped in mid-processing, according to Mike Stearne, group financial manager of computer services for the department stores.

Stearne and two other 370/145 users affected by the unsuccessful manual attempts to rectify the problem had no warning from their systems that the power had even fluctuated a total of 8% between 9 and 9:20 p.m. or would go off at 9:34.

IBM 370/145s have an electrical component called a "motor generator" that smooths the flow of electrical power to the CPU to combat power disturbances and fluctuations, according to Stearne.

That equipment, built into the mainframe to prevent data loss or error, allows an easy transition from a voltage drop even as great as that suffered by New Yorkers before the actual blackout, Stearne explained.

Although the two second-shift employees in the DP department at the City of New York Municipal Services also had no warning from their system, they turned off the power to it when lights began flickering and dimming during the first voltage reduction.

Two employees at Data Dimensions, Inc. followed the attack plan taken by Gimbel's DPers by shutting the system down seconds after the lights went out altogether, Frank Crocitto, facilities manager, told *Computerworld.*

No Plans for UPS

None of these three users had a UPS before the blackout and none plan to get one as a result of it because, as they see it, it is unnecessary considering the small number of blackouts.

As for what the blackout "cost," the Data Dimensions spokesman noted his people who were on standby with flashlights in the computer room were bored, hot and generally uncomfortable.

After the blackout, one of these users called IBM to bring its 370/145 back up because he said he had to do so. Another opted to have IBM service engineers power-up the system and the third did it himself.

Gimbel's, Data Dimensions and the Municipal Services office all work their systems 24 hours a day so, as one user said, all that could be done after the power returned was to run the jobs faster or do critical jobs first.

Unlike many shops that returned to normal operations last Monday, Gimbel's Stearne said his shop was back on schedule by last Thursday.

Even with a staff increase, there is very little a 24-hour shop can do to get back on schedule except "pray a lot," he added.

None of the users reported any equipment damage from the blackout or related problems.

At Lever Brothers Co., flickering lights were the first indication that anything was wrong "and then everything just blitzed out," according to P. Healy, DP manager.

The DP center had no backup system, but operators were able to hit the stop button on the 370/155 and power down, so there was no damage to either equipment or data, Healy said.

Even though the system was down for 24 hours, there were no problems powering up as soon as electricity was restored, he said, but noted the center did have to wait for about an hour after that – until the air conditioners cooled the room to an acceptable temperature – to begin operating.

Tremendous Backlog

The Federal Reserve Bank was without computer resources from about 9:30 Wednesday evening until 10:45 Thursday night, according to a spokesman. But no records were lost, no equipment was damaged and "bit by bit things are being put back into order," he said.

Once the computer, an IBM 370/155, was up again, however, there was a tremendous backlog of work which resulted in many departments working over the weekend to catch up.

"All statistics we issue weekly are out; but we were still making some changes and revisions" as of last Wednesday, he noted.

He admitted, however, that some releases usually issued on Thursday did not get out until last Monday.

Interestingly, the Federal Reserve has a backup system for its offices, but not for the computer center. As a result, employees had lights and air conditioning for work on Thursday but no computer.

The bank's only real problem was the loss of its link with the national Federal Reserve communications switch in Culpepper, Va., and that was restored by Friday morning, he said.

This story was prepared by Toni Wiseman, John P. Hebert, Ronald A. Frank and Esther Surden.

Itel Ad: The CPU That Wasn't

(Continued from Page 1)

the 3033 is an upgrade to the 370/168.

Then, the reasoning goes, Itel will announce the AS/6 as a replacement for that newer system rather than for the older 168-3, as was envisioned in the advertisement.

By doing this, Itel will be placing the AS/6 in the marketplace as a competitor for a brand new IBM CPU which would be regarded as having a longer life than the older unit. It will also put Itel in the running with a compatible replacement immediately after IBM announces its product in the area, rather than several months or years later.

Originally, Itel had probably wanted to announce the AS/6 sometime in the week preceeding the July 18 issue of *Computerworld* and wanted the ad to appear immediately after the announcement, when the product would have received maximum press coverage, observers said.

The deadline for submitting a four-color ad in that issue would have been July 1 because of the way such ads are printed.

The ad was submitted to the *Computerworld* advertising department with an insertion order calling for it to appear July 18.

What happened next is a matter of conjecture, but apparently the firm decided to put off the announcement date. However, neither it nor its advertising agency informed *Computerworld* the ad was to be cancelled. Therefore, it appeared right on schedule, as called for in the contract.

DEC's Olsen Traces Mini Roots at MIT

By Ann Dooley
Of the CW Staff

CW Photo by A. Dooley

Kenneth H. Olsen

CAMBRIDGE, Mass. – The Whirlwind computer, the first of its kind, had all the features of a minicomputer "except that it was big," Kenneth H. Olsen, Digital Equipment Corp. president, told a group of MIT alumni here recently.

The Whirlwind was really very much like the mini, he said. Although it still used vacuum tubes, it had high-speed capability, was simple and ran in real time.

It was designed at MIT during the early '50s, when researchers everywhere were "feeling their way" because the technology was so new, Olsen said.

During those first years, people thought computers had to be built "taller than a man" in order to be impressive, Olsen recalled, adding the computer room was often kept dark with lots of flashing blue lights.

MIT had an advantage over other schools because it didn't allow professors to do the research, according to Olsen, so "we didn't have to make everything elegant."

Olsen and the others who left MIT to form DEC took a lot of valuable experience with them, he said.

When Digital was started, Olsen was told to tell the company's investors three things. First, he was to promise fast results "since most of the investors were over 80," he said.

Next, he was to assure a 10% profit. Finally, he was to avoid using the word "computer" in the company name since "computers were not making any profit and weren't expected to," Olsen said.

Growth Since '50s

Since the Whirlwind was designed in the early '50s, improvements have been negligible in some ways and dramatic in others, Olsen pointed out.

There has been an enormous growth in the types of computer applications, but "we are probably still naive about their use," he said.

Some of the more observable changes in computers are their reduction in size, the increased use of memory, decreases in memory cost and the reduced size and increased amount that can be put on a chip, Olsen said.

The cost of minis has steadily decreased, enabling them to be used where they've never been used before, he said. The mainframe dollar has gone down, but users are demanding more and more memory.

As a result, computers have stayed at essentially the same price, he noted.

Mainframes will always have their place and will never be taken over by minis, which will remain as an aid.

The most recent change in the computer industry is the rise of the hobby computer market, which will have great social significance, Olsen claimed. Soon, large numbers of people, especially the young, will learn about computers, he added.

There might be some overselling and "some disappointed parents because it doesn't make their kid a genius," Olsen said, but it will be a natural growth for the most part.

When change comes through natural evolution, no one notices it or gets upset about it, and that's what has happened with computers so far, he said.

As long as the industry can be "kept free of government control" it should continue on its positive course. Right now the U.S. dominates the world computer market, but if the "government gets its hands on it, that might change," he said.

For instance, if the government were to regulate standards, there would be few new developments, he said, because everyone would be afraid to experiment.

IBM Votes to Rebuy Big Blocks of Shares

ARMONK, N.Y. – IBM's board of directors has authorized another stock repurchase, this time of up to $700 million of its shares, at the current market price.

Last February IBM issued a tender offer to its shareholders, offering to purchase up to 5.5 million shares at $280 each. It eventually purchased some 3.5 million shares at an estimated cost of $721 million.

Rather than making a tender offer, IBM currently is simply letting it be known that it would consider buying large blocks of stock from time to time, according to an IBM spokesman. The offer is aimed primarily at institutional investors since IBM is only seeking blocks of "5,000 shares or more."

In addition, IBM said it will buy only through direct transactions with "principals who aren't brokers or dealers" and who offer the stock at no more than the market price at the time of the sale.

"We continue to believe IBM stock is a good investment for a portion of our funds," the spokesman said. "Prior to our tender offer for IBM stock earlier this year, we occasionally had offers to sell substantial blocks of IBM stock [to IBM], but we didn't pursue them.

"The decision to consider purchasing these blocks is consistent with our intentions during the tender offer," he said.

"The possibility of an overhang was certainly a factor" in the latest decision to accept offers of blocks of stock, he noted.

The $700 million offer, which translates into about 2.5 million shares at current prices, is a ceiling, not an objective, he added.

LOOK T.M.
FOR
MVS

For real-time performance evaluation. Now in MVS as well as SVS, VS1, and MVT.
It's the easy-to-use, on-line Software Monitor that uses *NO* resources when not in use.

LOOK for "Hidden" Problems

Console displays of system performance data enable immediate identification of "hidden" problems which cause visible symptoms of poor performance like: High Priority, CPU Bound Jobs • Channel, Device or Data Set Contention • High Paging Rate or Thrashing (VS) • Excessive Arm Movement • Core Fragmentation (MVT) • Lost I/O Interrupts • Inefficient Device Allocations • Program Loops • System Software Hangups

LOOK for Immediate Response

LOOK's unique straightforward commands yield immediate reports on the following system elements: • CPU Utilization, I/O Activity, Paging Activity • Wait Conditions • Device and Data Set Allocations • Control Block Contents • Core Utilization • Catalog Entries

LOOK for Unique Advantages

LOOK stands alone by offering:
- Instant performance information via console displays, as well as *hardcopy capability* for later in-depth analysis,
- Significantly less overhead when running (approximately 1%— which is 1/10 the requirement of most other monitors). Since LOOK is a command, it requires no overhead at all when not in use.
- Dynamic correction of certain system imbalances which are causing reduced throughput.
- Installation in less than 5 minutes. Commands that are straightforward and easy to use.

LOOK for Overall Satisfaction

LOOK already has gained *more than 250 satisfied users* in its first year. And LOOK users who participated in the 1976 Datapro "User Ratings of Proprietary Software" voiced their satisfaction by placing LOOK in the top 38 out of 1,446 software products rated. Recognition that LOOK is an effective tool for improving computer performance.

User satisfaction is not new to ADR. The LIBRARIAN, ADR's system for program security and protection, also won Datapro honor roll status—for the fourth consecutive year.

Unlike Trade Secrets, Contu Told

Economists Say Software Copyrights Better for Users

By Edith Holmes
Of the CW Staff

WASHINGTON, D.C. – Of the two principal methods now available to protect computer programs – copyrights and trade secrets – the copyright gives users better market information on packages they might buy.

This was one of the findings of a team of economists hired by the National Commission on New Technological Uses of Copyrighted Works (Contu) to study protection alternatives.

At a meeting here recently, William J. Baumol, a professor of economics at both New York University and Princeton, told Contu members that copyright protection reduces duplication of effort in the software industry and tends to lead to the availability of a wider variety of products – again, pluses for the user.

"Copyright promotes disclosure. Reliance on the trade secret statutes requires suppression of information on advances in software design," according to the economists' report, entitled "Economics of Property Rights as Applied to Computer Software and Data Bases."

If software suppliers have to rely on trade secret laws, they will have an incentive to keep their programs and data bases secret to prevent unauthorized use, the report added. Furthermore, programs will tend to be written in obscure form, adding to the problems of modifying software or transferring it to another manufacturer's CPU.

Copyright protection, on the other hand, encourages the development of software that can be used for many purposes and on many different mainframes since it gives a producer of programs a wider market without fear of unauthorized use of his products.

Duplication of Effort

Not only will potential buyers of software lack information on what is available to them if programs are protected by trade secret law, but competition among suppliers also will lead to a duplication of efforts, the report said.

"Too many resources will be devoted to the development of software which is similar to existing products – too few resources will be devoted to highly innovative and more risky software developments, which are beneficial to society, but less profitable to an individual firm," the study continued.

Presenting the preliminary results of the National Bureau of Standards (NBS) "Study of Copyright in Computer-Readable Works," Roy G. Saltman, the project's director, agreed.

"This study finds that without copyright protection for computer programs, losses in information flow, increased procedures for secrecy and less opportunity for creativity would result," he told Contu.

Debate Over Time

While Contu's members heard a clear preference for copyright over other forms of software protection from those the commission hired to look into the problem and from NBS, which is conducting an independent study of the matter, they also witnessed some disagreement over the means of providing copyright protection.

From Saltman's viewpoint, the author of a computer program should not be treated differently from the author of any other type of copyrightable work. So, he concluded, copyrights should last as long for computer programs as they do for any other work falling under their protection.

But Baumol and his colleagues believe there are one or more "optimal time spans" for the protection of software. The optimal time span provides a compromise between two effects, the economist said.

"On the one hand, the longer the period of protection, the more profitable is the development of new software and the more will be produced.

"But the temporary monopoly during which a producer can charge a price for the use of his products also discourages some potential users, and in this way reduces the social usefulness of whatever amount of software is produced," Baumol stated.

The report he presented to Contu identified four economic and technological factors which tend to favor a short protection period. They include the short useful life span of software packages; rapidly increasing costs with an increase in the production of software; a user demand for programs that are very responsive to price changes; and a high discount rate.

The economists developed formulas by which the optimal protection period for software could be calculated using industry data, but Baumol noted the actual choice of a protection period will require further research in gathering the necessary data.

He further asked the commissioners not to rule out the possibility of recommending several protection periods.

There is a social cost to extending protection beyond the point at which it is really needed, Baumol said. A protection period of two or three years is reasonable for software which has an average useful life of about four years, he said, but one NBS recommendation takes a better approach and would make this distinction between software and other copyrightable works unnecessary.

That recommendation urges that an original copyright be obtained only for the source program and not the object code. This would encourage a separation of the programmer's expression from the changing hardware technology, Saltman explained.

"Furthermore, even if popular source languages are altered or improved, or if new source languages arise, the copyright proprietor retains the right to modify his work or prepare derivative works, permitting him to update the program as required," Saltman concluded. "The writing of programs in source languages that can be expected to endure is promoted."

One argument often cited against copyrighting computer programs is that the software industry is so strong that protection is unnecessary.

However, the NBS preliminary study pointed out that copyrighting is not aimed at protecting an industry, but rather at protecting a particular work in the marketplace.

This government agency has concluded that copyright protection is particularly important for the smaller company that does not have the resources to engage in retaliatory measures or to protect itself from predatory practices of larger firms when its software is endangered.

On the subject of computerized data bases, the NBS contended that while it is "not immediately clear . . . whether the initial deposit [of data bases with the Copyright Office] should be a printout or a magnetic tape or disk . . . It seems reasonable to suggest that it should be the complete data base, not just identifying descriptions."

In the case of a data base that is continuously updated, the deposit of the complete data base could be required at least once in a period of several years – for example, every 10 years, Saltman stated.

Baumol Sees Software Growth Stimulating Economic Growth

WASHINGTON, D.C. – Encouraging software design, whether through copyright protection or by other means, is an important element in stimulating economic growth, William J. Baumol, professor of economics at both New York University and Princeton, said here recently.

Addressing the National Commission on New Technological Uses of Copyrighted Works (Contu), Baumol added that "declining costs of computer hardware and expanding opportunities for automation imply that computer hardware and software together will play an increasingly crucial role in our economic future."

Just how crucial a role does the economist foresee for computer technology?

Baumol cited a study he and several other economists made on the costs of library operations and publications some years ago." These costs turned out to be remarkably different from costs in the economy as a whole," he said.

While the level of general inflation was 1.5% at that time, the rate of inflation facing libraries and publications was between 6% and 7% and compounding annually.

Because labor is an essential part of the product traditional information institutions produce, their costs will continue to go up, Baumol said. As a result, he noted, there are increasing economic pressures for finding substitutes for the traditional means of disseminating knowledge.

Electronics costs have gone in the opposite direction of those of libraries and publications, Baumol stated, and there is "no reason to suspect the end of that trend is in sight."

Before long "we will have electronic substitutes for the information that has been stored in library stocks and contained in printed matter," Baumol maintained. "We may not like these substitutes, but economics will press us toward them."

The devices to replace or take over many library and publication functions already exist. However, they are little used because people are unfamiliar with them and, for the moment, they are more costly than traditional information approaches, Baumol said. In two decades, however, "what is science fiction today will be reality."

Three Counterclaims Dismissed In Brewer's Case Against EDS

NEW YORK – The case of F&M Schaefer Brewing Co. vs. Electronic Data Systems Corp. (EDS) has proceeded one step further with the dismissal of three counts of fraud brought by EDS against the beermaker.

In a recent ruling here, Judge Constance Baker Motley granted Schaefer's motion to dismiss three of EDS' counterclaims, all relating to fraud. Each of the counts, which were similar, asked for $4 million in damages, according to Thomas K. Christo, Schaefer's attorney.

Motley ruled EDS could not claim fraud against Schaefer. The ruling left three of EDS' counterclaims still before the court, although their importance is unclear, according to Christo.

The principle counterclaim of those remaining – one that has gone unchallenged by Schaefer – is breach of contract. Schaefer did not act on that count since it has already paid $1.3 million in a repleven action [CW, March 21].

In its suit, Schaefer claimed the computer system developed for it by EDS was inadequate and substantially similar to Schaefer's original system.

Motley denied the motion to dismiss the remaining two counts for equitable relief and for replevén. In doing so, she indicated repleven had essentially been granted by the court in March, Christo said.

Motley also denied the motion to dismiss equitable relief, which seeks to prevent disclosure of how the system works, seeming to indicate the point was moot since Schaefer had already stipulated to such an agreement, according to Christo.

The trial is scheduled to begin Nov. 14.

Users' Report...

"Winning Proposal" Winning Big!

A step-by-step guide to proposal preparation entitled *How to Create a Winning Proposal* is helping computer/EDP marketeers score big wins in their proposal efforts. In a recent publisher's survey, users of the book reported an impressive 42% average increase in the success-ratio of their proposal projects during the past year. Of the users polled, 68% attributed their successful track-record to the guidelines provided in the book.

Dubbed "Winning Proposal" in marketing circles, *How to Create a Winning Proposal* is rapidly becoming the standard text for use in computer/EDP hardware, software and service company proposal efforts. The book covers the entire proposal process . . . giving detailed instructions on contents, structure and methods of preparation for both solicited and unsolicited proposals. Technical, cost and management section checklists are included to ensure the proposal team of covering all the important bases.

Government requirements are covered in an overview of the U.S. procurement network, how it works, and how the proposing firm can increase its "win probability" in competing for contracts. Excellent guidelines on how to analyze and respond to RFP's, RFQ's and IFB's are also included.

Copies are available pre-paid only from Mercury Communications, Inc. 730-CW Mission, Santa Cruz, CA 95060. $55 includes 3-5 day delivery inside USA. In Calif. add $3.12 tax.

Privacy Report Warns Against Fed EFT, FBI Switch

By Nancy French
Of the CW Staff

WASHINGTON, D.C. – The Federal Reserve System's experimental electronic banking system and the Federal Bureau of Investigation's (FBI) proposed computerized message-switching system are both serious threats to individual privacy, according to the Privacy Protection Study Commission.

In its final report delivered to President Carter and the Congress recently [CW, July 18], the commission said "current problems with government access to bank records are minor compared with the potential threat to privacy posed by government operation of [electronic funds transfer (EFT)] facilities."

In light of its findings, the commission recommended that "no governmental entity be allowed to own, operate or otherwise manage any part of an electronic payments mechanism that involves transactions among private parties."

As for the message-switching system that would be operated by the FBI as a service to state and local law enforcement agencies, the commission said the system could permit the bureau "to collect and use information to which it might not be legitimately entitled."

While it made no formal recommendation on the system, the commission advised that any decision to give message-switching authority to the FBI or to any other federal agency should be made only if there is no alternative – and such a decision should then be made only by Congress.

Current System Not Useful

On the matter of EFT and the Federal Reserve's role in it, the commissioner's investigators found the current paper check-clearing system now operated by the Federal Reserve is not a useful source of information for government agencies because the system does not allow checks to be retrieved easily or selectively.

The situation changes, however, when the Federal Reserve uses telecommunications technology for processing private transactions, the report said.

Here, the commission learned, the Department of Justice has requested that the Federal Reserve supply it with information from records of transactions between private parties.

The commission said further that the Federal Reserve System's regulation of the financial community should not be tied to government operation of an electronic payments system. Even if a monopolistic but closely regulated EFT system does emerge, the agency that will have to oversee it should not also be in the role of operating its facilities.

The commission's argument here was supported by its general finding that "when any government entity processes financial records which document the private affairs of individuals, the likelihood and opportunities for other government agencies to obtain and possibly misuse those records increases."

For the Federal Reserve to continue its control over facilities for EFT is unwise, in the commission's view, particularly in light of the possible meshing of ACH services with point-of-sale services. Unless the Federal Reserve limits its EFT operations and begins divestiture now, the inertia of economic circumstance may destroy the policy choice.

Moving to the FBI's message-switching system, the commission focused on three problems it found "particularly pertinent" to the protection of personal privacy should the FBI control such a computerized communications facility.

First, there is little control over how criminal justice information is recorded, maintained and used – particularly when it comes to accuracy, the report said.

Further, the information in such file systems is ordinarily derived or "copied" from another record, which in turn may be a copy of a third. The chances for error in transferring information from one record to another are great, particularly when the first transfer is from a paper record.

These vulnerabilities to error "create a system with inherent accuracy and reliability problems but one which, nonetheless, is used to make decisions that affect individuals powerfully and immediately.

The second problem cited in the report grows out of the current pattern of unrestricted information flows between law enforcement and investigative agencies at all levels of government.

While not critical of this per se, the commission noted that "easier access to information by agents within a unit and greater facility to exchange information between units will increase the potential for abuse."

The third problem relates to the question of federalism. At one level, it is a classic problem of the proper role of the central government in furnishing local services. At another level, however, it is a problem posed by one agency operating the information services on which other agencies depend and thus being able – at least potentially – to control the format of the other agencies' records and to use those records for its own purposes, the commission said.

While such an ability is only potential, the transformation of that potential into actuality has occurred before.

It occurred between April 1971 and February 1974 when the FBI monitored requests for information in the NCIC made by state and local government agencies. The monitoring involved flagging the names of persons in whom the federal agencies had some interest, including 4,700 who had no criminal record, the commission said.

Florida Fraud Squad Not Yet in Operation

(Continued from Page 1)

to Florida businesspeople; he received the best reception from the American Society of Industrial Security "because it is in that business."

"We are trying to let the business people know perpetrators can be punished," Martindell said. Computer crime would be treated as "another case of grand larceny . . . the investigative procedures are pretty much the same, but without a specialized training program agents can't deal with it."

The Federal Bureau of Investigation has shown some interest in the Florida program and will be presenting a four-week training program in computer crime in Quantico, Va., this summer.

CICS Users...

Your monitor doesn't
do enough for you.

TASK/MASTER® Version II

- Has better network management facilities
- Is much easier for application programmers to use
- Has a better restart and recovery system
- Makes "mapping" easier and more flexible
- Is far easier to install, maintain, and operate
- Has more flexible terminal support
- Has better database support
- Has better facilities for report transmission
- Has more programmer-productivity features
- Has better message switching facilities
- Has better statistics and diagnostic aids
- Plus a lot more

And now you can move up to
TASK/MASTER automatically.

Our new CICS-to-TASK/MASTER Converter turns source programs written for CICS into source programs which run with TASK/MASTER. Write or call today for the details. We'll do our best to enlighten and liberate you.

Carter Plan to Move OTP Seen as Possible Demotion

(Continued from Page 1)

new Assistant Secretary for Communications and Information, who will perform many of the functions previously performed by the head of the OTP," Carter said in his letter to Congress.

The President's Reorganization Office suggested the staff in the Commerce Department be responsible for general policy development and act as the Administration's spokesman on telecommunications issues.

In addition, the old OTP organization, which would be combined with the Office of Telecommunications in the Commerce Department, would coordinate U.S. participation in international communications conferences and negotiations, perform national telecommunications policy analyses and make frequency assignments to government agencies, the spokesman stated.

When OTP and Commerce's telecommunications office are merged, the new Assistant Secretary for Communications and Information will have a staff of approximately 200 people, he added.

Lost Coherence?

Hollings and Van Deerlin do not want to see the degree of coherence in OTP's past efforts regarding information policy lost in its incorporation into the Commerce Department, and they fear this organization won't have enough of substance to do, the Senate subcommittee spokeswoman said.

If Congress takes no action on this reorganization plan in 60 days – in this case, by Sept. 15 – the President's proposals will go into effect. The first 30 days are considered a "clarification and amendment" period, during which the Administration can answer concerns raised by members of Congress.

During this time period, the Senate and House Communications Subcommittees hope to learn whether all decisions and power regarding information and communications policy will in fact be vested in OMB and the Domestic Policy Staff, the spokeswoman said.

If this does happen, they will propose the creation of a Telecommunications Information Administration headed by an administrator under the Commerce Department, she stated.

What makes an administrator better than an assistant secretary? An administrator has a higher salary and a more visible position in the federal government, the spokeswoman said.

"It would be like giving telecommunications and information policy a house in which to live, rather than an apartment in a high-rise building," she added.

There are already five assistant secretaries in the Commerce Department. The position of administrator would provide national information policy with a better "presence" and the public would have more effective access to their government in this area, the spokeswoman said.

Hollings and Van Deerlin are not alone in their concern over the President's plan. Earlier this month, the president of the American Federation of Information Processing Societies (Afips), Theodore J. Williams, wrote to Carter asking him to take into account the importance of OTP and the National Bureau of Standards' (NBS) Institute for Computer Science and Technology in any reorganization plan.

Williams detailed the activities of OTP and the institute and expressed the hope of computer and communications professionals within Afips that the expertise these bodies have will not be lost.

"As you know, Congress is now reconsidering in committee the Communications Act of 1934, as well as instituting a study through the Office of Technology Assessment on related technologies," Williams wrote to the President.

"We believe that as the Congress focuses on telecommunications, computers and information policies as areas of broad national attention, it is important for the executive branch not only to recognize the significance of this area, but to be in a position to adequately respond to proposals which will be forthcoming from the Congress," he said.

"Further, we believe that a coherent national policy is necessary to, first, allow unfettered growth of this beneficial technology, free of unnecessary regulatory intervention; and second, that government decisions in areas which are regulated (including communications, electronic mail and electronic banking) are indeed made from a broad perspective of national policy considerations, and in a full understanding of the many interrelationships which exist between the regulated and nonregulated sectors of these technologies," Williams added.

The Afips president offered his federation's assistance to the reorganization effort in this area.

U.S. vs. IBM Traveling Again

By Catherine Arnst
Of the CW Staff

NEW YORK – The U.S. vs. IBM antitrust trial will hit the road again this week with a return appearance in Florida and an overseas performance in London.

The parties have agreed to complete the testimony of two witnesses who are unable to travel by going to them and taking their testimony by deposition. This testimony then will be submitted as evidence.

One of the witnesses will be Ernest Hughes, a retired IBM employee who first took the stand in Miami last December [CW, Dec. 6].

IBM had requested that Hughes and three others on the firm's list have their depositions taken before the defense portion of the trial begins in order to assure their testimony is heard. These witnesses are either elderly or unable to travel.

Judge David N. Edelstein agreed to hear Hughes last December since he would be in Florida, but he rapidly lost patience with the lengthy questioning of the witness and refused to stay beyond the two days he had originally allotted. Consequently, the rest of the witness' testimony will be completed via deposition starting Tuesday in Fort Lauderdale, without Edelstein's presence.

Attorneys will be going to London Wednesday to depose Richard Saalfeld, a vice-president with the Bank of America. Saalfeld appeared in New York in April [CW, May 16], but contracted hepatitis before he completed his cross-examination. Although he is considered to have recovered, he is still unable to travel or even to work full days.

Meanwhile, back in the main showcase of U.S. vs. IBM, Frederic G. Withington, a financial analyst with Arthur D. Little, Inc., is on the stand.

Withington fought his appearance as an expert witness for the government all the way up to the Second Circuit Court of Appeals and lost.

Willing or not, Withington was ordered to comply with his subpoena and testify.

HIGH COSTS KEEPING YOU OUT OF TELEPROCESSING?

GREYHOUND PHOENIX
GREYHOUND COMPUTER CORPORATION / SYSTEM 360

HERE'S THE ANSWER:
GREYHOUND PHOENIX ICA

Here's a *proven* performer that turns a 360/30 into an economical RJE terminal with stand-alone capability or a host computer for multiple terminals.

It's the Greyhound Phoenix Integrated Communication Adapter (ICA). It gives any 360/30 user a communications controller equivalent to an IBM 2701 with Synchronous Data Adapter Type II, EBCDIC Code and Transparency.

AT LESS THAN HALF THE COST!

The Greyhound Phoenix ICA is available immediately. You don't even have to give it floor space—it sits on top of the cpu. At least 85% of DP shops engaged in teleprocessing (or considering it) can make profitable use of the Greyhound Phoenix ICA. Let us give you facts and figures. Contact: Tom Ryan, Eastern General Mgr., (617) 272-8110; Jerry Smith, Central General Mgr., (312) 298-3910; or Dave Hyland, Western General Mgr., (415) 283-8980. Or mail coupon below.

Yes, I am interested in your ICA. Please contact me at:

Users Vote Against Bell Bill

(Continued from Page 1)

bylaws.

TCA has sought to become more involved in outstanding issues that affect telecommunications users; some time ago it participated in a California rate proceeding. The latest resolution is believed to mark the first time that a major user group has taken a stand on an important telecommunications issue.

TCA has thus far sent copies of its resolution and position paper to Rep. Timothy Wirth (D-Colo.), Sen. Barry Goldwater (R-Ariz.) and members of the Federal Communications Commission (FCC), Barnwell said. The TCA position will also be sent to House and Senate subcommittees when future hearings are held on issues related to the Reform Act.

Competition 'Most Gratifying'

TCA takes the position that the results of FCC-approved competition have been "most gratifying" from the viewpoint of the user. According to the resolution, "numerous new products and services have been introduced to fill voids that existed in the telephone carrier's product lines."

As a result, "latest state-of-the-art technology has become available permitting the business consumer to optimize his telecommunications systems," the paper said.

"The net result is the consumer can now choose from a proliferation of products and services that can fill almost any business need. The disadvantages inherent in dealing with a single supplier have been virtually eliminated."

Commenting on the portion of the Reform Act that would give individual states the power to regulate terminal equipment used in interstate communications, the TCA said this would have the effect of "fragmenting authority over the interstate communications network into 50 separate state jurisdictions.

"The end result would be a hodgepodge of diverse and differing regulatory policies with respect to the rights of consumers to supply their own communications devices."

In opposing the Reform Act, the paper said, "the evidence collected thus far indicates no economic harm has come to the telephone industry as a result of the FCC's selective competition policies. To reverse [these policies] and return to a monopolistic structure would clearly be to the detriment of American consumers and the entire telecommunications industry."

Additional details concerning TCA activities are available from Robert Barnwell, Fibre Board Corp., 55 Francisco St., San Francisco, Calif. 94133.

They Were Blazing Mad...

ROME – A trio of women armed with guns held three Rome University staff members at gunpoint as a male accomplice set a computer center on fire here recently.

Covered with gasoline before being set aflame, the computer was totally destroyed. Damage to the center was estimated to be at least $2 million, according to sources.

The motive for the incident is unknown.

Compromise Funding Revives VA's Target System

Washington Update

By Edith Holmes
Of the CW Staff

WASHINGTON, D.C. — Like a cat, the Veterans Administration's (VA) controversial claims-processing system called Target has come back to life again.

In a conference committee meeting here recently, the Senate Appropriations Subcommittee gave way to the House of Representatives' position on most aspects of the system proposal. The result was a compromise designation of $18.4 million for Target in fiscal year 1978.

The money will permit the VA to go forward with the construction of its central Target facility in Chicago.

The conference further determined that of the three regional centers to be built in Chicago, Los Angeles and Philadelphia, only the Chicago center will be established at the present time.

Speaking for the House Appropriations Subcommittee, Rep. Edward P. Boland (D-Mass.) maintained the system could save the VA between $60 million and $70 million over the next 10 years.

"There is no real substantive reason for turning this system down," Boland said. He added that "members of Congress should not be in the business of choosing agencies' computer systems."

Technology: Ignore It; Maybe It Will Go Away

The House Committee on Post Office and Civil Service began hearings last week on a bill designed to revise postal operations in light of the spiraling costs of the U.S. Postal Service.

Contrary to the recommendations made in a spring report by the Commission on Postal Service, the "Postal Reform Act of 1977" (H.R.7700) does not require the post office to investigate the possibilities of electronic mail technology.

H.R.7700 calls for the appropriation of funds for a stronger research and development program within the Postal Service, but "that's as specific as we felt we could get," a spokeswoman for the House Subcommittee on Postal Operations and Services said.

The subcommittee chaired by Rep. James M. Hanley (D-N.Y.), who sponsored the bill along with Rep. Charles H. Wilson (D-Calif.), indicated during hearings on the commission's report that it wanted better R&D and better Presidential and congressional oversight, she added.

"But the technolology changes so fast . . . How can we delineate what we want the Postal Service to do?" the spokeswoman asked.

A Shot in the DOT

For the National Law Enforcement Telecommunications Systems (Nlets) board of directors meeting in Atlanta in May, the decision whether to permit the National Driver Registry (NDR) to use its statewide communications system was a moot point.

Nlets understood that NDR officials would look elsewhere for a telecommunications network to run their pilot national computer system designed to help states identify drunk and reckless drivers and keep them off the road, according to C.J. Beddome, Nlets executive director.

Accordingly, the board decided the matter wasn't worth another official vote.

But the U.S. Department of Transportation (DOT), of which NDR is a part, expected Nlets to reconsider its January decision that even the pilot system would he too large for the Nlets network to handle, NDR contract officer Jim Lockard said.

NDR considered Nlets concern for the size of the project "honest" and expected to pay for the additional hardware needed to manage the traffic the license validation system would create, Lockard added.

NDR had to look elsewhere after Nlets' first denial and will continue to do so now in the absence of any further word from the organization, Lockard noted.

Among the alternatives NDR is investigating is the possibility that the DOT computer center will develop a network of its own. That network could take longer to build than NDR has to wait, however, Lockard said.

NYU Program Offers Degree in One Year

NEW YORK — A new diploma program in computer technology which can be completed in one year of evening classes will he offered by New York University's (NYU) School of Continuing Education in September.

The 16-credit program was designed to provide the necessary skills to land an entry-level position as a computer maintenance technician or to upgrade skill levels of individuals already employed in the electronics industry, the University indicated.

Students in the program will meet twice a week from 6 p.m. to 10 p.m. for two semesters.

Tuition is $925 per semester; an admissions test and interview are required.

Applications should be submitted by Sept. 1. Candidates should have completed two years of college, but students with exemplary experience or personal achievement will also be considered, according to the university.

Additional information is available from the NYU School of Continuing Education, Shimkin Hall, New York, N.Y. 10003.

Course to Cover DP In Art

NEW YORK — A mini course that explores the computer's role in the arts will be offered at Columbia University here in October.

Among the guest lecturers and artists who will address the class are Charles Dodge, an associate professor of music at Brooklyn College; Genevieve Greenwald-Katz, an architect; Ken Knowlton, computer artist and technical staff memher at Bell Telephone Lahoratories; and Lou Katz, computer facility director at the university's Cancer Research Center.

The course will cost $100. Information is available from Jessica Gordon at Columhia University Program for Continuing Education, New York, N.Y. 10027.

Only Perkin-Elmer gives you two terminals for the price of one.

Mix or match any two of our unique forms handling accessories. Combine journaling with single- or multi-part forms printing by mounting journal-roll holder and front forms-insertion device . . . or pair front-insertion with a pin-feed tractor accessory . . . or snap on two pin-feed tractors. In seconds, you can mount any combination that meets your needs. Carousel's split-platen feature then lets you feed, advance, tabulate, and print each form, sheet, or tape independently, under operator or computer control.

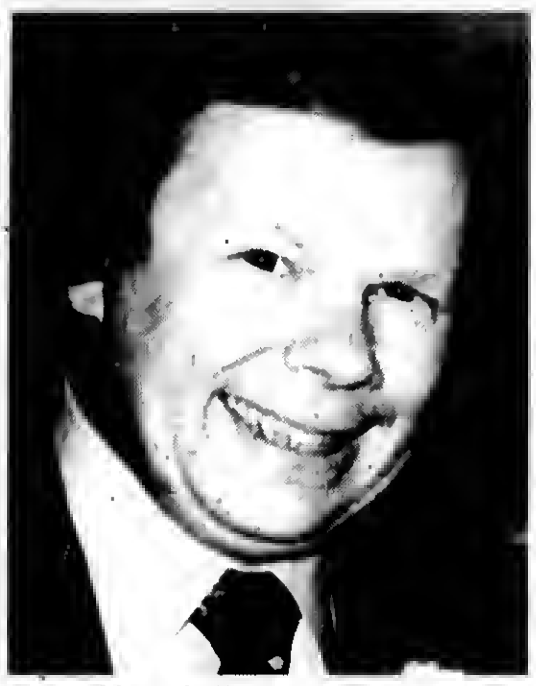
Systems Analyst Sought by FBI for Fraud

NEWTON, Mass. — The Federal Bureau of Investigation (FBI) has asked *Computerworld* and its readers for help in locating Henry Joseph Manning, systems analyst wanted for bank fraud and embezzlement and mail fraud.

Manning is also known as Paul H. Allen, Harold David Bradley, Allen Collins, Dr. James Parker, David L. Robinson and Charles Tulley, the FBI said.

Manning, who is believed likely to seek employment in the computer field, is also wanted by the State of California as a prison escapee. He has reportedly passed thousands of dollars worth of fraudulent checks around the country.



Wanted: Henry J. Manning

Warrant Issued

A federal warrant for Manning's arrest was issued on March 4, 1976 at Kansas City, Mo.

Manning was described as a white male American, born on Nov. 8, 1937 in Denver, Colo., although he has also used Dec. 19, 1941 and April 16, 1942 as dates of birth.

He is 6'1" tall, weighs approximately 200 pounds and has brown hair and blue eyes. He has eight slash marks on his inner left arm, a cut scar over his right eye and an appendectomy scar.

Armed and Dangerous

Manning's Social Security number is 528-44-6655, although he has used numbers 432-26-2981, 457-11-3326, 451-88-4799, 452-23-9281 and 502-43-7063.

Manning has been diagnosed as a paranoid schizophrenic with suicidal tendencies. He should be considered armed and dangerous, the FBI said.

Anyone with information concerning Manning is requested to take no action other than to contact the nearest office of the FBI, the telephone number of which may be found on the first page of most local telephone directories.

CUSTOM TAILORED DATA TERMINALS
AT OFF-THE-RACK PRICES

You'll find Carterfone a rather unique supplier of office data communications terminal equipment — unique because we "custom tailor" hardware to perform for your system's specifications. That means you no longer select from what's available. Define what's needed, and Carterfone provides it and supports it with our own nationwide, professional service organization.

We're not kidding when we say that you can have custom tailored terminals at "off-the-rack" prices. Office data communications equipment — manufacturing, servicing, renting, leasing, and selling — that's our only business. This means you will receive the support and equipment required for your communications network that you expect (but usually don't get) from other data terminal suppliers.

If you've got the feeling that your present or planned terminal equipment is something of a compromise and not totally meeting your requirements, give Carterfone a call.

State, Federal Laws Dealing With Privacy Reach Total of 333

WASHINGTON, D.C. — More than nine states have now passed fair information practices acts that limit disclosure of personal data in state information systems and allow individuals to see and correct their own files.

This year's *Compilation of State and Federal Privacy Laws* published here recently by the *Privacy Journal*, a newsletter "on privacy in the computer age," indicated there are now more than 300 state laws affecting the confidentiality of personal information.

No state has yet passed privacy legislation affecting data collection in the private sector, however, although two — Maine and California — require private and public employers to allow persons to see and correct their own personnel files, the report said.

According to the compilation, 16 states and the federal government now regulate the consumer credit reporting industry and 20 states provide their own privacy safeguards for criminal justice information systems.

The states with fair information practices acts similar to the federal Privacy Act of 1974 are Arkansas, Connecticut, Indiana, Massachusetts, Minnesota, Ohio, Utah and Virginia and, most recently, Indiana.

An additional six states have enacted security safeguards for their state information systems, but do not provide individuals with a means to inspect and correct data about themselves, the report stated.

Laws Categorized

Privacy Journal's 1977 edition includes state and federal laws in the following categories: arrest records, bank record, consumer credit reporting, criminal justice information systems, government data banks, employment records, medical files, polygraphing, confidential privileges, school records, Social Security numbers, tax records, wiretapping and general privacy protections in states laws or constitutions.

The 1977 edition includes descriptions and citations for all statutes, including several enacted since the compilation was published in 1976. It also includes the texts of 28 representative state and federal laws on privacy.

The 215-page book of 333 privacy laws is available for $12.50 from *Privacy Journal*, P.O. Box 8844, Washington, D.C. 20003.

Scot Gets HP Award For Thin Film Work

PALO ALTO, Calif. — The 1977 Hewlett-Packard Europhysics Award, which carries with it an $8,000 cash prize will go to a professor at the University of Dundee in Scotland.

The winner, Prof. Walter Eric Spear, D.Sc., who is on the staff of the university's Carnegie Laboratory of Physics, is being honored for his contribution to the physics of thin film semiconductor technology.

The award, which is presented by the European Physical Society (EPS) for outstanding achievement in the field of solid-state physics, is donated by Hewlett-Packard S.A., HP's European headquarters organization.

Spear, whose academic title is equivalent to a Ph.D., is being cited for work that led to the discovery that electrical properties of thin film semiconductors could be altered by introducing impurities. This opened the way to a new range of semiconductor devices.

The first application of these devices is in the fabrication of a solar cell that absorbs the sun's rays better than previous materials. In addition, the technique lends itself to the fabrication of large solar panels at lower cost.

Spear will receive the award at the Third EPS Condensed Matter Division Conference in Leeds, England, this month.

What Software Development Was Meant To Be...

There's a new spirit at INFOREX. Our bright, progressive Software Development team is actively engaged in resolving solid technical challenges in data entry software by applying a disciplined approach. If you're not realizing your full potential where you are now, our instructive, highly professional environment could be what you're looking for!

Development

System 3300

System 3300, the newest and most powerful addition to Inforex's line of key-to-disc products, is a sophisticated editing and pre-processing data entry system. A contemporary, "turnkey" software system provides the foundation for high-volume, multifunction data entry. Several opportunities exist for innovative software engineers in the development of System 3300 Software.

Challenging opportunities exist for senior level systems programmers to employ contemporary software development techniques in the design, implementation and testing of operating system software. We currently have openings for contributors with five or more years experience in multi-tasking operating system analysis and design, binary synchronous communications and data management.

Good communications skills and an ability to work in a programming team environment are required. Prior experience in commercial turnkey systems and graduate studies in computer science are preferred.

Several opportunities exist for individuals with three to five years experience in mini-computer software systems development to implement data entry applications and operating systems software. Implementation responsibilities include detail design, structured implementation and testing of System 3300 software. These openings offer programmers an opportunity to learn contemporary software development techniques while contributing to the success of this new product line.

System 5000

System 5000 uses the same mini-computer base as the System 3300 to address customer requirements in accessing and maintaining the numerous files of information necessary to conduct business on a daily basis. While closely related to the data entry market, System 5000 provides power tools for managing and tracking information *after* it has been entered with a computer. Sophisticated file management software allows the System 5000 user to enter, retrieve, update and process information in an on-line, real-time manner.

Specific opportunities exist in the System 5000 group to design, implement and test new file management software. Individuals with three to five years experience in implementing mini-computer turnkey systems will find an opportunity to apply their problem-solving skills while learning contemporary software development techniques. Prior experience in operating systems and/or data base management is required.

System 7000

Join an experienced team to develop new software for our sophisticated mini-computer-based multi-terminal System 7000. This new product features time shared COBOL and remote communications in a virtual memory environment.

You'll do top-down design and then implement in one of the system's three languages.

You'll need five to ten years experience in program design and coding in assembly and higher level language, including mini-computer experience.

Systems Programmers

We are looking for mini-computer programmers who have experience with turnkey and end-user systems. These individuals will work with Assembly Language programmers developing software for our Intelligent Key Entry Product. You should have seven to nine years programming experience, a Bachelors Degree in Computer Science, Mathematics or related discipline.

Software Systems Engineering

If you've got the talent . . . we've got the challenge for an individual with eight to fifteen years of solid professional experience in all phases of Systems Analysis and Programming on mini-systems. Ability to translate ideas into action, with a marketing perspective. Proven record of accomplishment in Communications, Networks, File Management, or Data Entry.

You'll have professional responsibility for long range software planning, software technical direction for multiple product lines along with a leadership role in new product definition, evaluation and feasibility.

Diagnostics

Diagnostic Programmers

We are seeking flexible Diagnostic Programmers with 5-9 years experience to be responsible for the creation of diagnostic functional specifications, review of engineering changes, and design critiques of new hardware. This will include working with a variety of hardware/software systems, generating new diagnostics, and enhancing current ones. The ability to interface effectively with design engineering, field engineering, and all facets of the manufacturing process is essential.

We offer outstanding starting salaries and comprehensive company benefits. Please send resume and salary history to J. Paul Costello, Employee Relations Department.

An Equal Opportunity Employer

Drafted by Governor's Commission

Indiana Enacts Privacy Laws Covering State Agencies

By Molly Upton
Of the CW Staff

INDIANAPOLIS — Indiana's legislature and governor have approved a bundle of privacy laws, many of which appear to parallel those applying to federal agencies under the Privacy Act of 1974.

The state's Fair Information Practices Act does not apply to the private sector and covers only state agencies that report to the governor. This excludes those under the state auditor, treasurer, secretary, attorney general, the department of state police and the state-supported institutions of higher education.

This law provides a procedure by which records kept by various state agencies may be declared confidential and declares that after July 1, 1978, all records are public except those categorized as confidential.

Under another privacy law, information retained in both manual and computerized files must be deemed relevant and necessary to that agency's purposes; all other data shall be expunged upon annual review.

Individuals have the right to see and correct their files: Agencies must provide the file's recipients with either a correction or a copy of the subject's statement disputing the record.

Under still another law, state agencies must file an annual report with the governor delineating the type of personal information systems it maintains as well as how to contact the person immediately responsible for keeping the system in compliance with the new privacy laws.

As of Jan.1, 1978, Social Security numbers may not be required except by revenue, welfare, employment and state personnel agencies, unless the agency is required by federal law to obtain the number.

Limitations will be placed on the sale of compiled information by the Bureau of Motor Vehicles.

DP Oversight Committee

A data processing oversight committee, established by the legislation, is in charge of "coordinating the operations of the various data processing systems within the administrative branch of state government [and] developing consistent policy . . ." It is also responsible for "promoting economical, effective and integrated DP services, operational security and adherence to the principles of the code of fair information practices for individual privacy."

The laws also differentiate between criminal history and criminal intelligence information, and they limit the type of information that may be collected and stored on individuals for criminal intelligence purposes.

In line with other edicts attempting to eliminate extraneous information, a law permits individuals with no records of prior arrest and no criminal charges pending to petition to have their mugshots and fingerprints destroyed if no criminal charges are preferred or if charges are dismissed.

If the petition is granted, the arresting agency would not be permitted to forward a record of the arrest to any local, regional or statewide repository for criminal history information, according to one of the new laws.

Preparing for Implementation

The laws were drafted by the Governor's Commission on Individual Privacy. The commission was established two years ago and it disbanded upon passage of seven of its eight proposals, according to James T. Smith, liaison between the commission and the governor's office.

Prior to the new legislation, the state had no laws addressing privacy, he said.

In order to prepare for implementation of the Fair Information Practices Act, each state agency directly responsible to the governor is to go over its records of personal information and sort out those it thinks should be maintained on a confidential basis.

The governor and legislature will then declare as confidential those records they vie as falling in this category.

Annual Inventories

State agencies are also required to conduct annual inventories of their records and justify to the Commission of Public Records their retention of, or recommendation for disposition of, various records.

Although the Bureau of Motor Vehicles (BMV) may continue to sell individual records, effective Jan. 1, 1978 it will be allowed to sell compiled records only when the purchaser certifies the information is to be used only to notify owners of vehicle defects or for research or statistical reporting purposes. In such cases, individual identities must be properly protected and not ascertainable from the published reports or research results.

The DP oversight committee consists of representatives of the governor and auditor, the director of the Budget Agency and the Commissioner of the Department of Administration.

Intelligence Records Defined

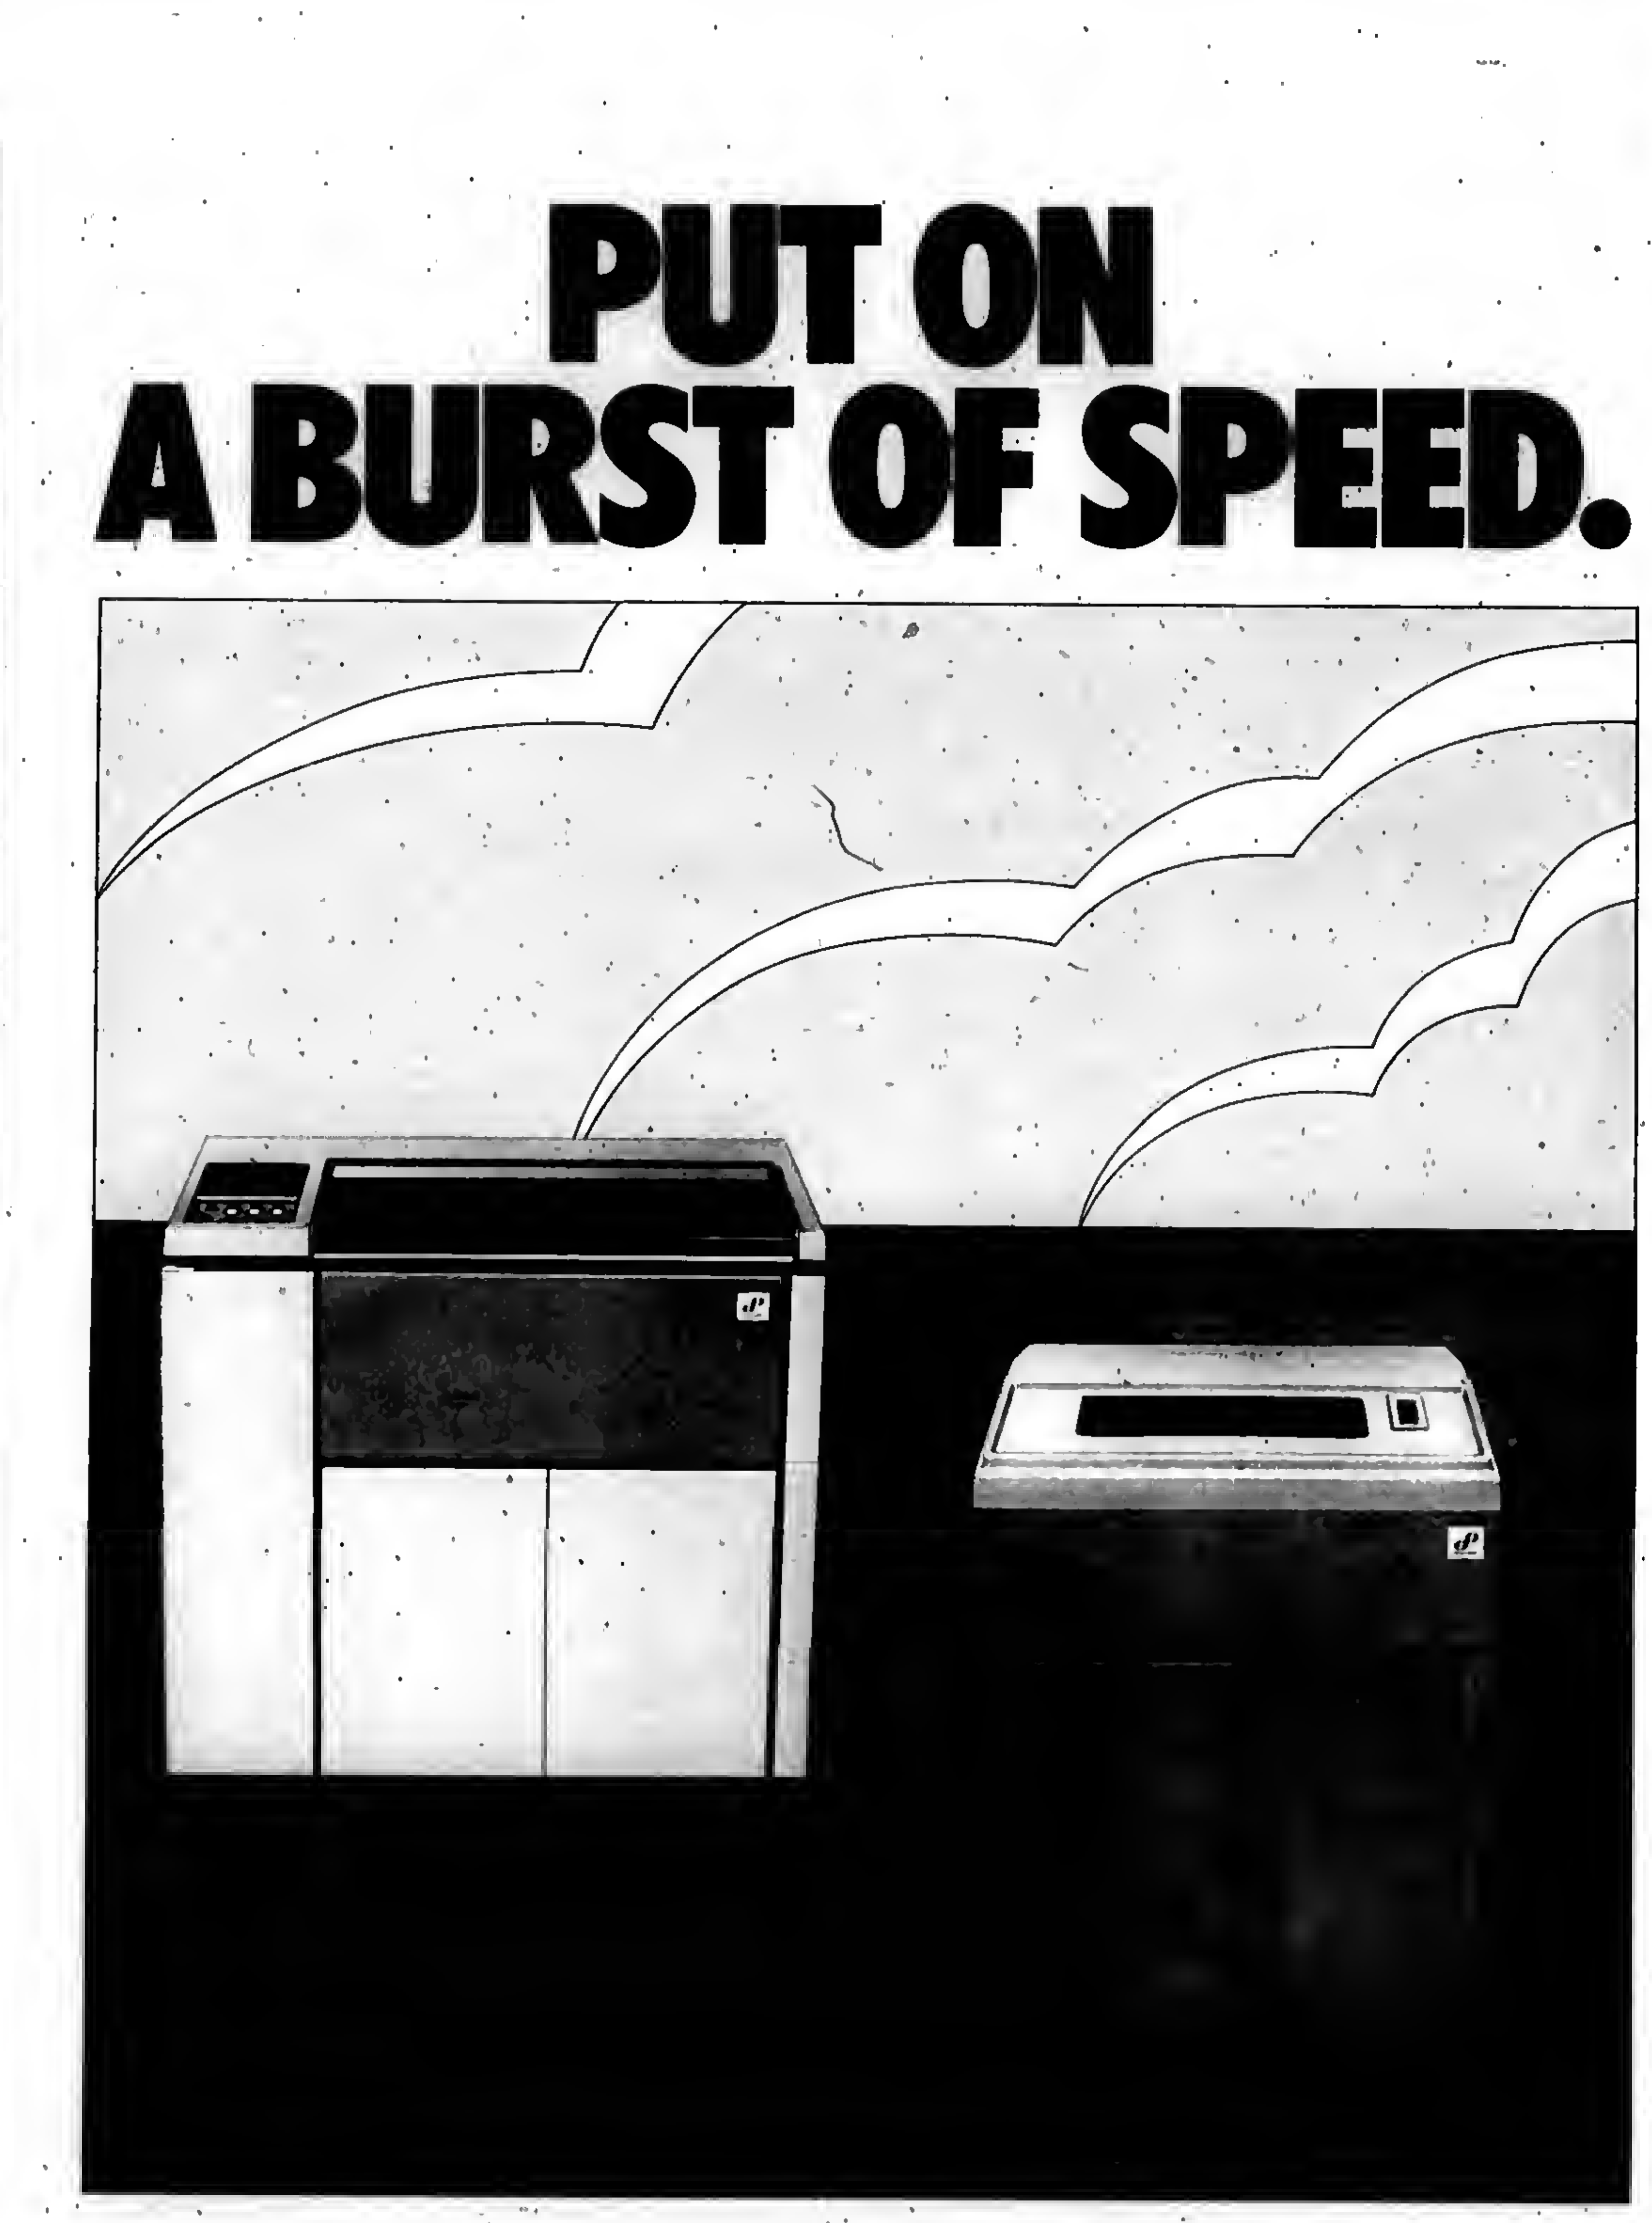
Criminal intelligence records are defined as "information on identifiable individuals compiled in an efort to anticipate, prevent or monitor possible criminal activity."

As of Oct. 1, 1977, such data may be collected and maintained "only if grounds exist connecting the individual with known or suspected criminal activity and if the information is relevant to that activity," according to the legislation.

"No information is to be collected or maintained about the political, religious or social views, associations or activities of any individual, group, association, corporation, business or partnership unless such information directly relates to an investigation of past or threatened criminal acts or activities and there are reasonable grounds to suspect the subject of the information is or may be involved in criminal acts or activities.

"Criminal intelligence information is declared to be confidential and may be disseminated only to another law enforcement agency ... ."

The disseminating agency must be satisfied that the recipient has a genuine need to know and that it will safeguard the confidentiality of the information, the law said.



DP on Fiche

GLOUCESTER POINT, Va. — An annotated bibliography on the computer's impact on society is available on microfiche from the Virginia Institute of Marine Science.

Prepared under the auspices of the Education Board of the Association for Computing Machinery, with a grant from the National Science Foundation, the bibliography contains more than 2,000 entries of books, articles and other items, most of which are annotated.

The list is alphabetical by author and is stored in a hierarchical storage and retrieval system at the University of Wisconsin. Special-purpose subsets may be obtained.

The complete set costs $2.30 for U.S. orders and $3.30 for others from Gerald L. Engel, Department of Computing and Statistics, Virginia Institute of Marine Science, Gloucester Point, Va. 23062.

Model Legislation Needed

Lawyers Urge Industry Action on Taxes

By Molly Upton
Of the CW Staff

SAN FRANCISCO — The computer industry could and should play a more active role in deciding how its products and services are taxed, speakers at a recent Computer Law Association conference here agreed.

The DP industry needs to formulate model legislation and take more action regarding assessment of equipment, they said.

Currently, various states have asked what the industry position is on taxing various aspects of DP, according to Al Eisenstat, vice-president and corporate counsel of Tymshare, Inc. However, the industry does not have a succinct statement of its position.

It will be inordinately difficult to get the various segments of the industry to agree on anything more specific than "nothing related to DP should be taxed" and "there should be no retroactive taxation" Eisenstat pointed out.

But if model legislation could be drafted, perhaps it could be distributed for use by groups in various states as they wish, rather than factions such as software and services firms hammering it out on the national level, he suggested later.

At the very least, there should be some legislation recommending uniform treatment of DP products and services on an interstate basis, he said.

According to Eisenstat, the Association of Data Processing Service Organizations (Adapso) is the logical group to draft the model legislation, since it represents several areas within DP. He said he will continue to move to get Adapso to allot funds to have professionals help draft the legislation.

Attorney Robert H. Fabian told attendees they can help themselves by developing and encouraging the use of services which evaluate current market value and comparable sales prices of DP items.

Often, because tax authorities generally are not willing or able to apply the same techniques to DP gear as to other areas, assessors may look to industry sources for estimates of the current market value of DP hardware and systems, Fabian said.

The industry itself must be aggressive in steering the course of events in the tax area because of the inconsistencies and wide discrepancies which exist both in definitions and in motivation from one taxing jurisdiction to another, he stressed.

Michael Berwind, an attorney with Chickering and Gregory, said records of comparable prices may be a valuable aid in dealing with tax problems at the federal level.

The Internal Revenue Service may look to the rental terms of competing lease proposals and at other vendor or user documentation in arriving at the "fair rental value" of equipment in making a lease/-purchase determination, Berwind said.

New York Set to Hear DP Tax Suggestions

ALBANY, N.Y. — An informational hearing for all interested parties will be held by the state tax commissioner here to gather recommendations for regulations taxing DP in the state.

These will then be considered and submitted to the state tax commissioner. If they are approved they could become regulations, according to Peter Crotty, deputy commissioner and counsel for the State Department of Taxation and Finance.

There is a growing dispute in New York State over what is subject to sales tax. A 1966 statement unearthed by Robert Sherin, who is involved in fighting DP taxation in several states, says that software is exempt from taxation.

The following question and answer: "Q. 194. Are services involving the analysis, planning, design and programming of electronic data processing systems exempt?

"A. Since this service is not specifically made subject to the sales tax under Section 1105, it is exempt."

But then in 1973 the New York law on sales and use taxes seemed to take an opposite view. There, Section 55-069 states, "The furnishing of information by printed, mimeographed or multigraphed matter or by duplicating written or printed matter in any other manner, including the service of collecting, compiling or analyzing information of any kind or nature and furnishing reports thereof to other persons, but excluding the furnishing of information which is personal or individual in nature and which is not or may not be substantially incorporated in reports furnished to other persons ... ." is taxable.

Some firms claim they received notices of deficiencies in tax payments prior to 1973 — before the regulation was written.

Crotty admitted that past pronouncements weren't "full approaches" and have led to the differences of opinion.

The meeting will be held at 10 a.m. on Aug. 23 in Room 206, Building Nine of the State Office Campus here in Albany.

Those interested in appearing at the hearing should notify Arnold Glass of the Sales Tax Regulation Task Force, Building 9, State Campus, Albany, N.Y. 12227, and should prepare six copies of their statements.

Those who wish to enter statements in the record should submit them by Aug. 11 to the above address.

Speed is relative.

You may already have the best 600 LPM printer on the market.

The Dataproducts 2260.

Or you may already have the most dependable 1200 LPM printer made.

The Dataproducts 2470.

But if neither is fast enough for your increasing needs, there's no need to leave the family you trust.

You can put on a burst of speed.

And maintain interface compatibility while you're at it.

The 2290 at 900 LPM

The obvious (and smartest) move up from the 2260 is the 2290.

Perfect for all high-performance, mini-computer based systems and remote terminals at 9600 baud and up.

It offers superior quality printing at 900 LPM (with a full 64 character ASCII set); it offers the Mark IV print-hammer system for unmatched reliability.

All for about half the cost of current high-speed printers.

Couple that with extraordinarily low operating costs, and the 2290 is like money in the bank.

The 2550 at 1500 LPM

The most economical move up from our own 2470 (at 1200 LPM) or any other 1200 LPM printer is our 2550.

It was created for large volume EDP computer and terminal installations that require high-quality printing, a flexible font mechanism and high-volume throughput.

The 2550 is a 1500 LPM, horizontal font Charaband® printer that sets a new high-speed standard.

And it costs less!

The Charaband action eliminates sliding friction and, combined with the Mark IV hammer, offers consistent, straight-line, high-quality printing.

What's more, the 2550 is compatible with almost every major computer system that requires high-speed performance at low operating costs.

Accelerate now!

Both the 2290 and the 2550 are available for immediate delivery.

And both offer high-speed, high-quality printing at low operating cost.

Dataproducts specializes in printers.

That's why we can offer you an answer for your specific high-speed application.

For full specifications on the 2290 or the 2550 (our high-speed team), write or call collect.

Quickly.

Bell Companies Get Nod to Collect Political Donations

By Ronald A. Frank
Of the CW Staff

NEW YORK – Bell System operating companies have received the go-ahead to collect contributions from management employees for use in funding political campaigns as a matter of official company policy.

According to an announcement issued this month by AT&T chairman John D. deButts, individual Bell companies will be able to set up political action committees (PAC) at the discretion of their respective managements.

These committees will be empowered to collect political contributions from company paychecks, in accordance with the preferance of individual employees.

An estimated 17,000 Bell System employees at the district management level and above will be eligible to participate in the voluntary program, according to an AT&T spokesman. Employees at the "E Level," or those making about $25,000 per year and over, also will be eligible.

Like United Fund

Administrative machinery for setting up the PACs will be handled by the operating companies in much the same way that funds are now collected for United Fund drives and other charities, according to an AT&T spokesman.

In cases where employees do not instruct that contributions be donated to specific candidates, the PAC will determine which candidate is to receive the funds, the spokesman said.

Two operating companies, Pacific Northwest Bell and Ohio Bell, are now setting up PACs and other units of the Bell System will probably consider similar actions, although participation is not mandatory, the spokesman noted.

AT&T itself is expected to have a PAC in operation later this year, he said.

Initially the PACs will be aimed at national political parties and candidates for federal office. But support for state and local candidates could also be forthcoming where permitted by state law.

Two Problem Areas

An expert on election practices said two possible problem areas could arise with the AT&T policy. First, by virtue of AT&T's monopoly position, its PAC-collected funds could exert an unusual impact on an election simply because of the company's number of employees and market position.

Secondly, if employee contributions are not kept strictly confidential, members of management could exert pressure on an employee to contribute funds to a candidate favored by management, the expert said.

An AT&T spokesman denied this would be a problem, saying information about contributions would be known only to the employee and members of the PAC. Further, solicitations for funds would be made by "equal level" employees so an employee would not be put in the position of having to respond to a request for funds from a superior, he said.

Administrative and clerical costs of the PACs will be "identified separately and not used for ratemaking," the spokesman said.

Each PAC will be broken down into three subcommittees. The administrative committee would solicit the funds from fellow workers; the finance committee would be responsible for accounting and recordkeeping; and the dispersal committee would be responsible for contributing the funds.

In a letter to Bell operating companies, deButts said the PACs "provide a workable and honorable political fund-raising tool to support our democratic electoral process."

Contest for Hobbyists

NEW HAVEN, Conn. – A five-year membership is the prize in a name-the-users'-group contest sponsored by computer hobbyists exchanging information on the use of Heathkits.

The more obvious choices are ruled out because Heath Co. objects to use of their trademarks by an independent organization.

Entries and requests for further information should be sent to Charles A. Floto, Apt. 10, 267 Willow St., New Haven, Conn. 06511.

Distributed Confusion

There are almost as many approaches to distributed processing as there
By letting your needs dictate the right solution, Hewlett-Packard can help

You already have a large EDP investment. The last thing you need is a distributed data processing plan that makes your present operation obsolete. Or that will be out of date itself in a few years.

At Hewlett-Packard, we've worked out several ways to simplify the problems of putting your computer power where the work is. Our systems can help you make the most of your system, let you computerize many functions you're now doing manually, and still give you central control through links to your big computer. And they're so versatile that they can adapt to future changes in distributed data processing.

This all-around performance makes the HP 3000 an ideal departmental computer. You can dedicate it to solving a wide range of problems such as order processing, inventory control, cost accounting and materials requirement planning.

You'll see a dramatic improvement in efficiency at your plant or sales office or distribution center. At the same time, you'll have a better data entry system with the capacity to edit and check data before transmission to the central computer. By reducing inaccurate entries, you can shrink your communications costs.

Our system is also easy to expand, either within a department or into a complete network of computers that share information and programs.

Putting an entire network of computers at your fingertips.

We've developed new software, DS/3000, that turns a series of HP 3000s into the simplest, most functional network available today. You can sit down at a terminal and use the programs, files and data in any interconnected HP 3000. You don't need a special program to do it. Simply identify the computer you want to talk to and you're on-line.

With the same ease, you can shift programs and files from one HP 3000 to another. And you can do local and remote processing at the same time.

Imagine how much faster remote sites can get accurate, up-to-the-minute information this way than they could by depending on the overworked central computer!

How a small computer handles big computer jobs.

The HP 3000 has versatile executive software that manages all the computer's resources. Advanced design gives it the speed and power needed to handle more jobs more quickly than comparably priced computers. (Our U.S. prices start at $110,000.)

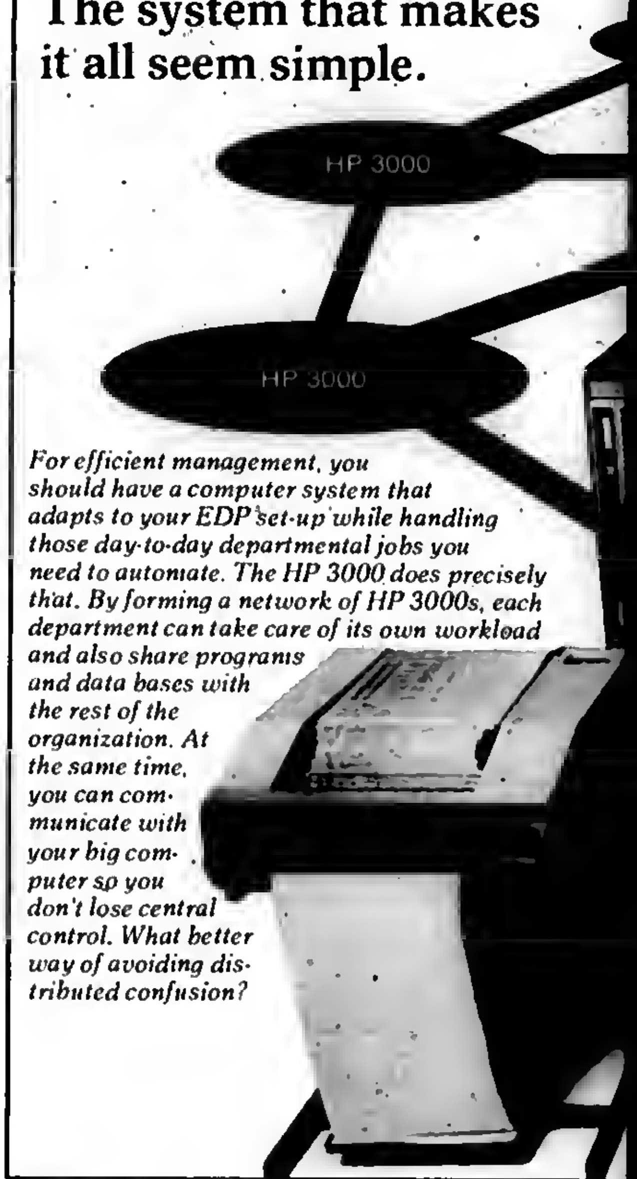
While you're getting information from the computer on one of the terminals, the system can be running batch programs.

You can also use as many as six "big computer" languages, run large programs on our small system and develop software quickly and inexpensively. (A very important consideration when you look at the climbing costs of programming.)

The executive software is so advanced that it will remain the heart of our computers for years to come. So you can keep adding to your system without having to throw your old programs out the window.

And the built-in flexibility of the HP 3000 helps you stay up with all the latest trends, no matter what direction distributed data processing takes in the future.

**The HP 3000:
The system that makes it all seem simple.**



For efficient management, you should have a computer system that adapts to your EDP set-up while handling those day-to-day departmental jobs you need to automate. The HP 3000 does precisely that. By forming a network of HP 3000s, each department can take care of its own workload and also share programs and data bases with the rest of the organization. At the same time, you can communicate with your big computer so you don't lose central control. What better way of avoiding distributed confusion?

Hessians' Privacy Abused Despite Law

Special to Computerworld

WIESBADEN, Germany — The Hessian Data Protection Law, now six years old and the first of its kind, is being rewritten to conform with a new federal statute set to go into effect here next year.

Although this will be a major challenge, according to Dr. Spiros Simitis, Hessian data protection commissioner, it will not overshadow enforcement of the present law.

In his sixth annual report, Simitis cited a number of cases which show that despite six years' experience with the law, "public administration" does not always give it the necessary thought and priority.

The following incidents have occurred recently:

- Illicit communication of personal data of insurance agents, damaging the careers of persons involved.
- Insufficient observation of data protection regulations when studies were conducted by a research group.
- Acquisition of sensitive personal data in a town clerk's office by auxiliary personnel not bound to secrecy.
- Passing out-of-date DP printouts with citizen registration data to a nursery school as drawing paper.
- Communication of citizen's personal data to private firms without prior consent.

Simitis has submitted a model draft law to the Hessian parliament that he believes will serve to unify the state and federal legislation.

Swiss Data Law Merges Privacy, Security Concerns

By G. Russell Pipe
Special to Computerworld

GENEVA, Switzerland — The Swiss are legislating to protect "computer-processed data," supplementing already strict requirements on disclosure or foreign transmissions of trade and business data.

The emphasis is on security and confidentiality of data in automated systems, rather than privacy involving rights of access and control of personal records.

Three cantons, Basel, Geneva and Argovie, have taken initiatives at their own level while the Federal Council, or cabinet, is discussing the desirability and constitutionality of a national privacy law.

Geneva's "Law on Protection of Computer-Processed Data" recently came into force. It couples statutes suppressing access to public and commercial records, especially banking information, with comprehensive DP security/-confidentiality rules covering data on individuals and legal persons which are maintained by any public authority.

The legislation specifically requires that:

- The files, data and results covered be established, transmitted and stored in such a manner that they cannot be consulted, altered, extracted or destroyed by any unauthorized person.
- The Council of State decides, on a case-by-case basis, to what extent the services of the canton and community administrations and those of the institutions established under public law can consult or extract files, data and results. To this end an enforcement order will be established.
- The Council of State may authorize the creation of data banks and information systems affecting several services or administrations.

Security Stressed

A blanket rule of secrecy is imposed on DP personnel. The law specifies that "persons entrusted with preparation, transmittal, storage and processing of data are pledged to secrecy; in particular they have no right to communicate to, or make available to, other real or legal persons, or to other public services, the information obtained in the exercise of their duties, unless authorized or obliged to do so under the present law or its enforcement order."

A State Computer Information Control Committee composed of five members will be named to:

- Ensure the statutory and legal provisions concerning the confidential handling of information and files are strictly observed during operations.
- Render opinions on proper disclosures of data in certain cases.
- Give judgments on the complaints made by persons who believe that certain data files contain errors or are used for improper purposes and that their rights have been violated.
- Submit annually, or more often when necessary, a report to the Council of State.

are computer companies offering them.
you clear up the confusion.

Turning raw numbers into usable information.

Your big computer has data base management to consolidate related information into easily accessible files. This capability is just as important at remote sites.

It allows your key people to call up the facts they need instantly, and get them in an easily understandable form without wading through reams of paper.

The HP 3000 has an extremely effective data base management capability. With its help, the computer will generate forms, titles, page and column headings, data sorted by categories, subtotals, totals and averages. And, through DS/3000 software, you can call up any HP 3000 data file in your network.

Data base management on the HP 3000 has proven so efficient that it was recently named to the Datapro Software Honor Roll, placing it among the 38 top software products in the country.

It takes more than a good product to make it a safe buy.

Support has always been a top priority at Hewlett-Packard. For our computer customers, we have complete service before and after the sale, with on-site training and full documentation. Nearly 1000 Customer and Systems Engineers provide regular maintenance and give you applications and programming assistance. They work out of offices in 65 countries around the world, offering you efficient service at a remote location as well as at your headquarters.

So if you want to take the confusion out of distributed processing, now and in the years ahead, call your nearest Hewlett-Packard office listed in the White Pages. Ask for a Computer Systems representative. Or write for more information to Bill Krause, Hewlett-Packard, 11000 Wolfe Road, Dept. 304, Cupertino CA 95014.

Own Programming Business

Prison Inmates Find DP Pays Off Both Inside and Out

By Ann Dooley
Of the CW Staff

STILLWATER, Minn. — The DPers at Stillwater Data Processing Systems, Inc. (SDPS) enjoy their new trade and look forward to continuing in DP when they get outside.

For them, "outside" means the other side of the Stillwater State Prison walls.

Nearly all the DP staff are prison inmates who work for SDPS, a privately owned company, that was set up under the Minnesota Department of Corrections' private industry program.

The program is an attempt to rehabilitate prisoners and provide them with skills and training which they can use when they get out of prison.

Employees of SDPS receive up to $4.62 an hour for an eight-hour work day compared with an average inmate's top wage of $1.75 an hour. A lead programmer recently earned $1,042 in one month. Employees also receive liability insurance and workman's compensation.

Wages, which are comparable to those on the outside, enable the inmates to pay the prison for room and board — up to $120 a month. They are also able to help support their families, make restitution and save money for when they get out of the prison.

"The $100 'gate money' just isn't enough," according to Stanley Wood, private industry program director.

"We try to make it as much like the outside world as possible, with the same expenses," he added. "We are even trying to see if employees can qualify for unemployment benefits."

Competes With Outside Firms

Another reason for paying comparable wages is that the company contracts with outside businesses and SDPS's competitors could file claims of unfair competition against the prison.

In addition to paying wages, the year-old company pays all operating costs including rent for facilities from the state. Revenue for the month of April was just over $7,000 and it has been increasing each month. Although the company has not yet been able to meet its monthly operating costs of $7,700, it expects to do so by the end of the year — one year sooner than originally anticipated, Wood said.

SDPS also operates with loans from the Bush Foundation, which gave it $38,000; the Bremer Foundation, which will give $17,000 over a three-year period; and the Minneapolis Foundation, which is guaranteeing a $38,000 bank loan, pegged to 1.5% more than the prime rate. The loans are to be repaid from earnings.

An inmate-owned business such as SDPS is one of the first of its kind, according to Wood, since private industry within prison has not been allowed for many years. In the past, prisoners were often used as a source of slave labor to make license plates or other mass-production items. As these conditions became known to the public, private industry was banned from prisons.

SDPS does any kind of custom programming such as payroll, inventory, accounts receivable or sales analysis. It operates by remote job entry on-line to the client's computer from two terminals and a keypunch machine located at the prison.

The firm plans to install a computer on site within the next year which would enable it to go into time-sharing, Wood said.

Variety of Customers

Its customers include the state department of administration, Hennepin County, the University of Minnesota, Northern States Power Co., General Mills and Blue Cross-Blue Shield of Minnesota.

"We go out and solicit business and if we can do the work for them at a cost-effective rate, we'll do it," according to William Ward, president, marketing representative and one of the few noninmates in the company. "If I didn't think we were delivering, I'd say the whole concept was a bunch of B.S.," he said.

"That's not to say we're opposed to addressing sociological matters along the way if we can. But we must deliver a quality product at a competitive price," James Willman, operations manager, said.

Clients don't seem to be overly concerned with any possible security leak or computer misuse, Wood said. The employee inmates take an oath that no information will be divulged. In addition, operations are designed so employees work only on their assigned program and don't have access to any other information from the CPU at the client's site, he explained.

The staff includes six inmate DP employees supervised by Willman, who is also an inmate. Their number is scheduled to increase to 18 by next fall, Wood said. The six staff members and Willman are occasionally helped by a college intern and by Ward, who does the marketing.

At first, few minority inmates were applying, Wood said. But the company has adopted an affirmative action program and is making a push to encourage blacks, Indians and other minorities to upgrade their skills and get over the fear of failing, which is a primary problem, according to Wood.

Trainees take courses provided by the state of Minnesota and then receive in-service training through the company, of "a quality equal to any vocational program," Wood said.

Most of the trainees and employees would like to stay in DP. Donald Gray, formerly a drafting trainee, said one reason he likes computers better is because he earns three dollars an hour.

"It's a much better opportunity than turning out twine. I figure I'll be able to save about $10,000 if I'm here another two to three years," he said.

Willman also feels he will stay in computers when he leaves prison. He has been able to save $16,000 and to help support his family while working as manager for the company.

The large difference in wages between this and other prison employment under the private industry program has not caused any jealousy in the other inmates, employees said.

It seems to give the others hope to "see a program working for a change instead of dying on the vine as so many ideas there do," one worker said.

The company pays released employees a salary for six weeks after they leave prison. Often, they are hired immediately by a firm they did programming for while they were in prison, Wood said.

When hiring or choosing trainees, Ward doesn't look into the inmates' conviction or prison record, he said. "We're not concerned about what the individual is here for. We're interested in his present and future."

Several area computer firms loaned experts to the prison to help set up the company. SDPS's board of directors consists of executives from Control Data Corp., Honeywell Information Systems, Burroughs, Fabritec, Blue Cross-Blue Shield and General Mills as well as Willman and Ward.

DP Enters Realm of Stitchery

SOUTHFIELD, Mich. — Computerpoint, Inc. here has begun to offer custom needlepoint patterns on canvas enabling needlepointers to recreate a picture of their choice in stitchery.

Martin Berustein, vice-president of the firm, declined for competitive reasons to provide any details on his company's techniques, but he claimed that proprietary software developed by his firm enables a computer to make a pattern duplicating a picture that calls for colors of yarn selected from as many as 900 shades.

As many as 10 tints of one hue may be used to produce realistic results, giving lifelike dimensions to a picture or portrait. Individuals who have ordered custom patterns from the firm furnish artwork that "runs that gamut of American life," he commented. Many people want to have pictures of their deceased children reproduced, he said.

The needlepoint artwork is available in kit form, called the Picture Perfect Needlepoint Kit, and includes the computer-generated pattern, instructions, needlepoint ruler, canvas and Persian wool yarn.

Currently marketing the kit in test areas, the company is expanding its marketing across the country.

Computer Professionals...

Your career is 1/3. Your life is 2/3.

You'll all like NCR-Wichita.

We provide a state-of-the-art challenge in realtime architecture, develop network design and communication control for distributive processing in a revolutionary data processing minicomputer environment. Here you are given the chance to create and are treated as the unique individual you are. In our metropolitan location, the old west hospitality still prevails. In the midst of modern shopping centers, great restaurants, theatre groups, 52 parks, a solid school system and an opportunity for continuing education at three state universities. You can see the night sky like you have never seen it before and if you like outdoor sports, you will find this location gets your muscles working up to par. The people are friendly, the air clean, the water pure and there is plenty for all. Some of our opportunities are:

COMPILER DESIGN PROGRAMMERS

Serve as a team member for design development documentation testing and enhancing of large compilers.

MINICOMPUTER OPERATING SYSTEMS

Responsible as a team member for design, implementation and testing of interactive general purpose operating systems to support COBOL applications and utilities, written and assembly language.

DIAGNOSTIC DESIGN & PROGRAMMERS

Design, modification and support of diagnostic programs to provide for testing on new mini/micro processor based hardware systems.

SYSTEMS ANALYSTS

Experienced in performance testing and evaluation. Develop testing procedures to evaluate a minicomputer based interactive operating system in the areas of performance and stress conditions.

Illumination by Blackout

The increasing reliance of modern American society on computer systems was clearly illustrated during the recent power blackout in New York City and Westchester County [CW, July 18].

The effects of a blackout such as the one experienced in New York would, of course, be catastrophic whether or not there was a reliance on computers. But the increased reliance on computers — as well as other electrical "tools" or appliances — heightened the scope of disaster.

Consider the following, for example:

- Banks would not have been able to conduct business if they had reopened in the daylight hours. Without access to their computers, there was no way of knowing — quickly — such things as account balances.
- Hotels could not tell if travelers arriving in the city during the crisis had reservations. In many cases the computers were down and there were no hard-copy lists of people expected.
- Airlines — even in airports like Newark, which kept operating — often could not tell if passengers had reservations since they were tied into computers through switches in the affected area.
- In several hotels which have installed electronic door locks controlled by computers, the rooms were automatically locked and people who struggled up flights of stairs to reach them could not get in.

All of these things were minor inconveniences when compared with the massive problems that faced New York during the blackout.

But as society increasingly relies on computer systems, the effects of power outages and the like is sure to grow.

A Boon for All

The Office of Management and Budget is planning to review how the government procures and uses computer systems as part of President Carter's reorganization program [CW, July 11].

This is welcome news.

The executive branch of the government is the largest computer user in the world. While many of its systems are used for rather esoteric tasks such as intelligence monitoring and spacecraft control, there are also many applications similar to those of the average business user.

Because of this, the promised study could be beneficial in two ways.

First, any reduction in inefficient use of computers would help keep the cost of government down while, at the same time, providing increased services to the taxpayer. More efficient computer use could be a step toward the goal of making government more efficient, and more efficient government would benefit everyone.

Secondly, techniques learned by the government in improving the efficiency of its enormous computer investment may have direct implications for private-sector users. By identifying areas of inefficiency and developing ways to overcome them, the government could point the way for private enterprise to overcome its own inefficiencies in computer use.

It's a program worth the effort and worth monitoring.

Letters to the Editor

Ribicoff Bill Could Be Vehicle For Protecting DP's Innovators

There is a strong link between the two editorials in your issue of July 11.

First, I was very impressed with John Hersey's testimony. The man's brilliance is evident even in fields other than his own. I agree with the proposition in the last paragraph of the lead editorial, which suggested that some new way be found to protect creators and innovators.

The Ribicoff bill also answers a new problem in a new way (in the old days, we could not fit a 100K program into a 10K machine, either). Why not use the Ribicoff bill as a vehicle to develop protection for the innovators.

Peter F. Gundell

New York, N.Y.

Unfortunate Choice of Example

I must take issue with one of the assumptions in your editorial of July 11 endorsing the Ribicoff bill. The comparison of embezzling to armed robbery ignores the fact that the armed robber threatens the lives of the persons robbed.

It would be more reasonable to compare computer crime to grand theft, in which large amounts may be stolen, but without immediate threat to the life of the victim.

The implicit assumption that property is at least as important as human lives is precisely the attitude that has alienated a significant portion of the American populace from what it sees as an insensitive corporate society.

I hope this was merely a poorly chosen example and not an indication of your basic philosophy.

Darrell G. Tangman

Minneapolis, Minn.

It was a poorly chosen example. Ed.

A Job That Needs Doing

It is with bewilderment that I continue to read letters such as the one from T.C. Bartz, headlined "NCC Showed Interest in Certification Low" [CW, July 11].

His conclusion, based on the low number of attendees at the Institute for Certification of Computer Professionals (ICCP) sessions, was that "interest" rather than "necessity" is the mother of invention. The DP practitioners indeed may not be interested in certification, but they sure as hell need it.

Certification coupled with codes of ethics, conduct and good practice, as well as curriculum, accreditation, self-assessment and continuing education, is the basis for a much-needed DP "profession" to protect the public from poor practice.

ICCP is working on just that — a profession. If people like Bartz aren't interested in necessity, we regret it. We hope they change their minds, but we can't wait for them to get interested.

To paraphrase what Donn Parker said at NCC and recently printed in CW regarding the issue of ethics, we in DP have had only 25 years to do what the other professions took hundreds of years to do. But we have a job to do and we need to do it before "something" is legislated independent of our DP constituent societies.

J.J. Martin
Public Information Chairman

ICCP
Chicago, Ill.

Another Rave for 'Waves'

I am enjoying immensely the excerpts from *The Waves of Change* by Charles P. Lecht in the last several issues of *Computerworld*. This type of publication in your newspaper reflects well on the *Computerworld* image and enhances your professionalism.

I will certainly purchase Lecht's book when it becomes available and I hope CW will follow with additional book excerpts of the same caliber.

Thomas F. Meurer

Wellesley, Mass.

Human Skills Needed

Experts Explain Ways to Improve DP Teams' Output

By Jack Stone
Special to Computerworld

A growing but generally unpublicized movement toward understanding and improving the processes of building effective work teams in DP centers is under way.

The issue is briefly stated as follows: The typical formal DP organization is built upon the hierarchy of the manager and the managed, the supervisor and the supervised. Further, for proper control, technical personnel are coded into specialist slots — programmers · program and analysts analyze.

Yet most significant projects involve the formation of ad hoc task forces or project groups that somehow must solve DP problems that cannot be solved by the established organization or by individuals working alone.

One major reason why many such projects fail is that the people suddenly thrust into the team environment are not certain how they should operate in that milieu or how the team itself should operate. The solution to effective teaming, therefore, is dependent upon the host of factors involved in human communications, including the full gamut of human behavior and human needs characteristics, a skills area notably lacking in our industry.

William J. Frost and Carol M. Vaughan of the U.S. General Services Administration are key members of a current national effort to study how DP teams and work groups can be structured and operated to increase individual fulfillment and improve organizational efficiency and effectiveness. (They will be reporting on their work at the annual conference of the Association for Computing Machinery Special Interest Group on Computer Personnel Research in Washington next month, a meeting which promises to be the best one of its kind in years.)

Here are the highlights of the first part of my interview with them.

Q: Just what does team building mean?

Vaughan: Team building (or team development, which is perhaps a more acceptable term) is a set of strategies designed to improve results from an organization by creating an atmosphere of confidence and coordination through first developing consistency in what people want and what the organization needs. Second, it establishes a better climate of working together.

Q: Doesn't the project manager already try to accomplish these goals?

Frost: Well, the typical DP project manager has the responsibility, but he usually takes an authoritarian approach. He distributes work, provides methods and techniques, and expects the supervised to produce on his timetable. What results is that the typical team member is turned off by the project organization and loses incentive to produce. He turns out a minimally acceptable product which, when added to the output of other frustrated team members, results in project failure.

Peter Peterson recently wrote, "While many have said there is a danger that the computer will begin to think like men, a much greater danger is that men might begin to think like computers." One of the major problems in computer centers today is that too many DP supervisors act like machines and fail to apply the human understanding necessary to get DPers to work together.

Q: I hope you aren't suggesting the typical DP project manager should have a B.A. degree in behavioral psychology.

Frost: Oh, no! But the manager needs to have an understanding of and some training in the implementation of processes which help individuals change their attitudes and work for the team instead of themselves. Success in DP is sorely contingent upon the successful development of the project team, because it is only the effective, viable team that captures the creativity of employees at all levels of the organization.

It helps develop a problem-solving attitude on the part of team members and builds problem-solving actions into the work process. The effective team — one that really accomplishes its mission to the complete satisfaction of its members — has closely aligned the psychological needs of its members to the needs of the organization. It is the model of intraorganizational communications.

The Human Connection

Vaughan: You see, the major role of the DP department should be to assist in the creative decision-making process, based upon the free exchange of ideas and concepts. Then it should help translate these thoughts into practical and efficient automated systems. Creativity is simply not an activity which is directed, but is the result of open and unimpeded investigation and discussion among team members. We strongly feel that team success depends on creativity, that creativity comes from a democratic environment and that the authoritarian work group will in the long run almost assuredly lead to poor performance.

Q: It seems to me the project manager has to be a Renaissance man to accomplish the goals you set forth.

Vaughan: Well, it may seem so, but actually it's not too bad. We have identified five disciplines involved in the development of a DP team: planning, logic, systems, human behavior and human needs. Individually, the planner says, "You have to know where you are before you can decide how to get where you want to go." The logician says, "If you want to solve problems, you should begin with the thinking process."

The systems analyst says, "What is needed is a plan that brings each subsystem up to standard in the specified time to allow the entire developmental effort to work effectively." The behaviorial scientist says, "After the basic physiological, sociological and psychological needs are met, people will seek self-actualization."

Q: How do you put all of this together?

Frost: The basic principle of team development is that the team is used to effect change in the individuals' attitudes and style of behavior. All of the team members must assemble as a functioning group and together examine the behavior of each team member. Specifically, the team must examine the present attitudes and styles of the members; the effects of these attitudes and styles on the team as an entity and on the output of the team; and the choice and impact of alternative styles and attitudes.

For success in this endeavor, the entire group must recognize several things; conflict of ideas is a necessary step in the change process; attitudes must be developed and maintained to support a creative environment; and change is not uniform or consistent, but can be achieved only over long periods of time with persistent effort.

This interview will be concluded in next week's column, which describes the Frost/-Vaughan approach to DP team development.

Letters on topics related to the human connection with DP systems can be addressed to Stone at Suite 222, 2233 Wisconsin Ave. N.W., Washington, D.C. 20007.

Unprecedented 'Test'

Blackout Shows Lack of Network Contingency Plans

The recent New York blackout, which suddenly isolated some 10 million people, provided a test of computerized systems in practical operation which was unprecedented in scope. The 1965 blackout gave no comparable test of modern-day computer usage, its prime result being simply the closing down of many mainframes where power, air conditioning and elevators were down.

The Taylor Report

By

Alan Taylor, CDP

Networks, although some were operational, were not nearly as important as they are now, and few complaints regarding their operation were voiced.

In fact, few complaints regarding the operation of computer networks were heard during the recent blackout. But this seems to be because of the lack of understanding as to their role in some of the difficulties of the situation or because of apathy.

Perhaps the worst example of poor network operations came from the airlines. The New York area has three airports — La Guardia and Kennedy in the city and Newark in New Jersey. Newark has a separate power supplier. A number of airlines, including TWA, have centralized their reservation systems so someone in Newark wanting to reserve a flight leaving from Newark has to go through Manhattan — even when Newark is operational and Manhattan is not.

When the blackout was three hours old and it was known that it would last until after 8 a.m. the next morning, I was faced with the job of getting to Boston from Newark. I knew — from American Airlines — that the planes after 8 a.m. from Newark were sold out, but there were two flights at about 7 a.m. on Eastern and TWA. These, American told me, were available.

But trying to book them — that was the rub. I did and was told by TWA that because its Manhattan terminals were down nothing could be booked until after power returned (that was after the plane took off).

This, the airline told me, was the situation with all the airlines that had (so American said) moved their Newark reservations to Manhattan.

American was a recent exception to the rule, I was told when I reported to American my prior call. If American would let me reserve seats on TWA — which it might or might not — then fine. But TWA itself could do nothing.

American could do something and did, for which many thanks. But where were TWA's "terminal down" contingency plans? Do they exist? If not, why not?

Half Better Than None

TWA and, presumably, the other airlines were not really down. Its Manhattan office was not really isolated. TWA could communicate with the outside world with its own computers simply through the use of telephones — by calling American, if necessary. More likely, it could call TWA in Philadelphia or Washington. Then reservations could be given and confirmed.

The procedure would be slower than normal, but the airline would certainly be able to cope with bookings for planes flying during the blackout. Half a working system is better than none, but nothing was offered. That was the size of the failure.

Hotel networks faltered just as much when the terminals dropped power. The Sheraton and the Holiday Inn (and presumably others) had rooms, but they stopped booking them even though the mayor and others were urging everyone to stay put. (This was in the La Guardia area, too). Excuse: The computer (i.e., the terminal) was down.

The hotel network is not the same as the airline network case. Here we are dealing with the loss of control of immediately needed local resources rather than the lack of access to a remote central computer. If TWA's central system had gone down, no one would have been able to confirm our reservations, so central's being up was essential.

But in the case of hotels, it really didn't matter whether the central computer was down. What was needed was responsible local control of local resources.

Again, what was needed was a terminal-down contingency plan taking into account possible and entirely foreseeable requirements for the optimal use of those resources. But at least an hour into the blackout no such optimizing operation was in progress. Again, why not?

Con Ed Responsibility

Yet, with all the problems of the networks, the real blame for the network failures must go to Con Ed. As Mayor Abraham Beame said later, Con Ed's story had been that the lesson of the 1965 blackout was learned and Con Ed would not get knocked out again.

Yet, some time before the blackout, it knew that total crash was possible. It may have known months or even years earlier. Con Ed even took action . . . but it told no one.

Computerized networks and other users of Con Ed supplies are entitled to some information so they can bring their contigency plans into operation.

Nor were these the only affected terminal/network systems. Banking terminals and credit terminals were only some of the other public service systems that must have been affected. How did they react? How can they be improved?

Perhaps we need a power-cut emergency wire service like the one that passed the news of the American helicoper shot down in North Korea into New York television shows during the blackout. Computer sites could determine in advance whether to pay for such a signal as a precaution and then could make their contingency plans accordingly.

We certainly need something. If we take the opportunity to learn the lessons of the New York blackout of 1977, then we will be much more ready in 1980 to face power problems anywhere in the world.

Here's hoping. As usual, your suggestions as to suitable ways to get something done will be appreciated.

Hersey Argument Against DP Copyrights Exclusionary

Reader Commentary

By Calvin N. Mooers
Special to Computerworld

In regard to *Computerworld*'s recent editorial [CW, July 11] on author John Hersey's dissenting view on copyrights for computer programs, [CW, July 4], the first question we must address is whether there should be legal protection for computer software.

Hersey and most others are in the affirmative, but he objects to the use of copyright. He proposes a new manner of protection in a draft "Computer Software Protection Act" complete with provisions for instituting legal suits for recovery of damages and for injunctive relief.

Hersey's legislative proposal is so close to copyright in its essentials that he appears to be urging a redundant statute. We don't need duplication of the laws.

Hersey believes allowing copyrights for computer software writings (programs) will somehow cause a "pollution" (his word) of other copyrighted writings of an artistic or literary kind. Software is different and polluting, according to his argument, because it can be used with or to control machines.

He holds that software in a computer is a "mechanical process" or actually a "machine." This is bad because, in his words, "a definite danger to the quality of life comes with a blurring and merging of human and mechanical communication." Also, "it goes to the distinction between human beings and machines."

Hersey therefore wishes to reserve copyrights for artistic works — arts, books and music. (He overlooks the possible polluting effects of the present widespread use of copyrights for commercial advertisements, inflatable plastic Santa Clauses, junk jewelry, tables of math functions, etc,) He wishes to exclude from copyright writings which can be used with one particular mechanical device — the computer.

Cannot his exclusionary argument about mechanical pollution be applied to books which are prepared for publication by linotype or computer typesetter, rather than by hand with a quill pen?

Can't it also be applied to plays mechanically transmitted and presented by television? Or to art in the form of color photography?

What of ordinary typeset books which will soon be used to control reading machines for the blind?

Would Hersey forego copyright to one of his future novels merely becaue he composed it while using a desktop typewriter with an internal microcomputer with editing and correction facilities? What about books which will be published solely through the medium of a publicly accessible data base?

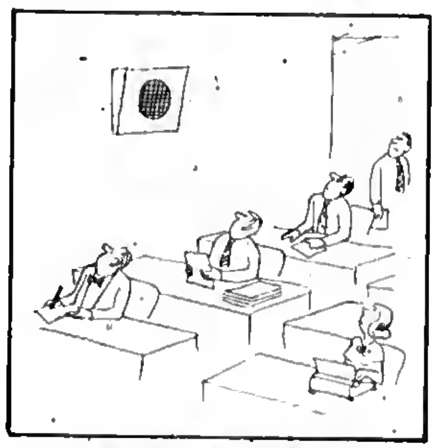
Only a little imagination is needed to show that Hersey's proposal, if acted upon, would create many future years of legal overlap, confusion and mischief.

Congress was quite clear as to its intent regarding computer programs during the legislation of the new copyright law. The committee reports of both the Senate and the House of Representatives said:

"With respect to the copyrightability of computer programs, the ownership of copyrights in them, the term of protection and the formal requirements of the remainder of the bill, the new statute would apply."

Amen.

Mooers is with Rockford Research, Inc. in Cambridge, Mass.



'Rumors That We'll Soon Go to Complete Automation Are Utterly Ridicuolous! This Is a Recording.'

Take an in-depth look at in-house timesharing:

You know the problems facing the data processing department:

Other departments in your company want faster response, broader capabilities, better service.

And your management wants you to hold down your operating costs.

You're probably looking hard for a solution. A closer look at in-house timesharing could give it to you.

Fast, long-lasting relief
Unlike upgrading a large central computer, expansion to an in-house timesharing system isn't a time-and-money-consuming ordeal.

And unlike buying outside computer time, you're not building in a monthly bill that inevitably keeps building up.

Adding an in-house timesharing capability is a shrewd way to add computer power. Because it won't add significantly to your operating costs; in fact, it can pay for itself by reducing current costs.

Especially if you add the system specifically built for timesharing: our BTI 4000.

A timesharer's timesharer
The BTI 4000 Interactive Timesharing System is made by us:

Basic Timesharing, Inc. We're the computer manufacturer with timeshare experience. Which has helped us produce a computer uniquely right for timesharing.

To help you do more—while helping your company spend less.

Easy to begin, room to grow
You can own your own BTI 4000 for as little as $35,950. For that you get a ready-to-go system with 10 megabytes of storage and 8 ports—just add terminals.

And start-up won't cause a departmental hang-up. The BTI 4000 can be installed and working for you in one working day.

Expanding to do even more work takes even less work. The BTI 4000 features modular construction, so system downtime for expansion is minutes, rather than days. You can add disk storage to 400 megabytes; increase user capacity to 32 ports; add peripherals like industry-compatible magnetic tape and a line printer.

Hard working, always working
The BTI 4000 is a true timesharing system. It allows doing any mix of tasks, all at the same time, all completely independent.

It also gives you continuous system availability, because software housekeeping can be performed while users are on-line.

There's also off-hours job-stream processing. So the BTI 4000 can be working for you, even when no one's around.

The BTI 4000 uses BASIC-X, an unusually powerful extension of the BASIC user language, enhanced for business programming.

What's more, the BTI 4000 offers heirarchal account organization and stringent security so that you can maintain total control over who's using it, and what they can do.

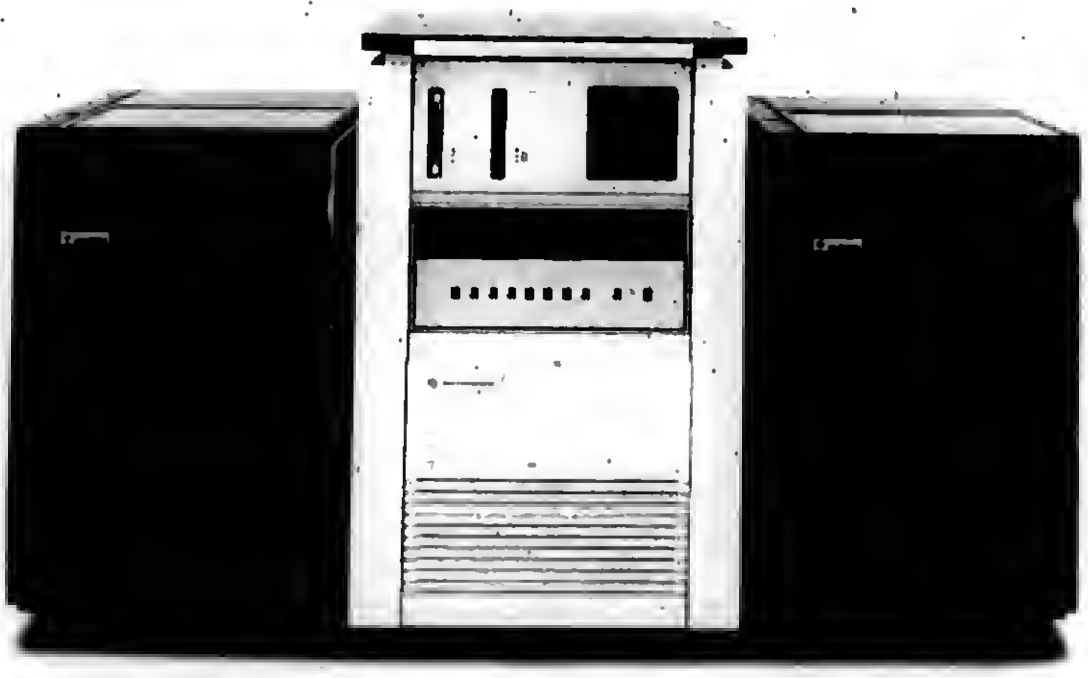
And it does all this without a full-time operator.

Inexpensive help
Used during typical office hours, the operating costs for a BTI 4000, including maintenance, are about $1 per terminal hour. And should you grow to 24 hour usage, your operating costs shrink to less than 10¢ per terminal hour.

Around-the-clock help
We back our BTI 4000 with any-hour, anywhere, on-line support with dial-up access for problem diagnosis. Yet in a typical installation, our maintenance plan costs less than 1% of the system's purchase price per month.

Look to us
The BTI 4000. The interactive timesharing system that will help your data processing department do more, for less.

For more information, just look to the Basic Timesharing office nearest you.



The BTI 4000 Means Business.

Basic Timesharing Inc., Headquarters: 870 W. Maude Avenue, Sunnyvale, CA 94086. Sales Offices: East: Cherry Hill, NJ (609) 662-1122; Midwest: Minneapolis, MN (612) 854-1122, Chicago, IL (312) 298-1177; West: Sunnyvale, CA (408) 733-1122, Anaheim, CA (714) 533-7161

COMPUTER FACILITY
BALTIMORE, MARYLAND

1st class computer facility is available on December 1, 1977 as follows:

- 4500 Sq. Ft. 1st floor, consisting of 2000 sq. ft. raised floor computer room 215 sq. ft. tape vault, 2285 sq. ft. of office and data preparation area.
- 1800 sq. ft. basement, consisting of 800 sq. ft. finished office area and 1000 sq. ft. of storage space.
- Computer room and tape vault protected from fire by a Fenwal Halon 1301 detection and suppression system.
- Electrical service to computer room consists of two (2) 400 AMP 240 Volt main feeders, plus transformer for 208 Volt system.
- Forty (40) tons of computer room air conditioning from two (2) units.
- Entire facility wired to an outside security system.

Entire facility is in excellent condition. Most equipment is less than two years old.

The entire 6300 sq. ft. with all improvements is available on a two-year lease at $4,000 per month net of utilities and maintenance.

An additional 7600 sq. ft. (4400 recently paneled and carpeted) is available in whole or part and would give tenant occupancy of entire building if desired. Convenient location at I-695 Beltway Interchange.

For Effective Software Management

Structured Programming Valuable for Its Discipline

By Bruee E. Spiro
Of the CW Staff

There have been, as Gopal Kapur reminded us in "Conflict Over Structured Methodology Goes On . . ." [CW, June 6], many articles on the subject. A good number of these have come from the scholars and teachers associated with software development, as they properly should.

We should not overlook, however, the more practical aspects of the implementation of any form of discipline in the software development and maintenance area.

In our organization, with some 75 analysts/programmers, we implemented structured programming about a year and a half ago. We made an early decision *not* to evaluate different ways, but rather to go with what we understood the best.

Whether it was the particular articles, books and letters we had read or not, we quickly gravitated to the Harlan Mills approach. We have been most happy with the results.

The biggest differences we have noticed are a greatly increased visibility; much better user/analyst/programmer relationships and understanding; and a more comfortable feeling that we know what is going on. These are not quantifiable, we have no "before" and "after" figures about productivity, correctness, etc.

For us, this has not been an experiment to be evaluated; it has been a management action taken to correct problems perceived by management. We count it a successful one.

First Real Discipline

No doubt there is long-range benefit in establishing the best methodology. More important to the practicing manager is the simple existence of discipline. As has been said, structured programming is not the absence of GOTOs; it is the presence of structure.

Whether it is chief programmer, Chapin charts, Hipo documentation or what have you, the structured methodology is the first real discipline that has come to our art. There are many confusing and often meaningless buzzwords, attracted by a not-too-well-defined process like software development. We need to look beyond this layer of smoke and put the effective and useful pieces to work for us.

As with all aspects of management, there is a highly personal element. What works for one individual or one group will not necessarily work for another. Theory X, Theory Y, Matrix and the others have been both successes and failures. We should know about them and then set up our own style that will work with our people and our environment, within the constraints that are known to exist.

So it is with structure in software development. It is essential that effective management proceed with what is useful without waiting for the ultimate answers.

Structured programming discipline can help. It will not cure all of the ills, nor will it be the last step to be taken. Like the systems we work on, management of software development is an evolving process that builds on past experience and must continue to take advantage of new and better ways to do things.

Managerial, Not Technical

The first thing is the recognition that the use of structured discipline is more of a management problem than a technical one. In this regard, the specific techniques used are not the thing; the use of a discipline is.

The hidden meaning of generalized status reporting gives way to specific, definable points that are indicators of progress when they are a part of an overall discipline. For example, the successful test of a single module has little meaning by itself, but as a sequential element in a top-down structure it is as much an indication of progress as a yard maker on a football field.

The key point is that a complete discipline must be used. Structured coding – the presence or absence of GOTOs – may be intellectually satisfying, but will not be of significant value to timely, accurate cost-effective product delivery unless it is a part of a cradle-to-grave discipline.

Make no mistake, structured coding is a powerful technique and may well be the foundation upon which a disciplined approach can be built. But it is only a part. The most powerful engine will not even move a car if the gear box doesn't work. Even worse, without a steering wheel, it may be best if the car is not able to move at all.

The complete discipline must start with customer interface. Call it pidgin English if you will, but formal grammar combined with standard formats such as Hipo charts can be a significant element in obtaining user understanding of what the systems developer intends to do. It can therefore be an essential part of the early isolation of misconceptions and design errors.

It has been our experience that use of these techniques has significantly reduced the need for reprogramming immediately after implementation because "this is not what I wanted."

Adding Detail

Using refinements, or a series of levels, of formal grammar, it is possible to add the detail needed for programming without destroying the initial meaning. This provides a program specification that accurately represents the mutually agreed-upon design.

The conventions of structured programming then supply the discipline that make a computer program a man-readable document. Properly executed, the listing produced reads like a book. No jumping from Page 37 to Page 9 for a couple of words in the middle of a sentence; no change in the meaning of a sentence by moving punctuation around or inserting different words.

We did not eliminate the GOTO; we found it is a useful device if it is clear why it is used and what purpose it serves.

In turn, the readability of the program makes the walk-through work. The problems sometimes attributed to the walk-through can be traced to the fact that the program itself can not be read easily by all of the participants.

When this happens, the basic problem of program readability must be solved before results can be expected from the walk-through.

The implementation of a structured discipline in a functionining software shop is not a simple thing. It should be undertaken with clear objectives, full management support and a high threshold of frustration.

There will be initial reluctance, and there will still be problems after the implementatioo is complete. First pass concepts and directions may have to be changed to fit individual circumstances.

Structured methodologies will not change the quality of the people; it takes good people to make any methodology work.

Structured discipline will, however, make the entire development process more visible to users, developers and managers. It will assist in the early isolation of design flaws. It will provide information for the recognition of schedule slippage at an early date.

In short, the discipline of the structured methods represent valuable tools and techniques that should be understood by all of us who are concerned with software development. They should be used as essential parts of responsible software management.

Spiro is chief of ADPE Systems, Management and Requirements Office, in the Defense Communications Agency Operations Center, Washington, D.C.

Reader Commentary

Top-down development really proves its worth in the testing process. Properly done, a top-down test provides a highly visible gauge of progress and an assurance that effective testing is being done.

"Properly done," is the key phrase. A sloppy structured program is no better than a sloppy unstructured program.

There is no guarantee of "goodness" in this or any other discipline, whether applied to computer software or not. The process of software development is a complex and difficult endeavor.

High-quality people are needed and knowledgeable management is essential. With these ingredients, a structured approach, well thought out and forcefully employed, can be of tremendous value.

IMS EDUCATION
In-House Courses Tailored for you

Two in-house courses for IMS from the Company specialising in Database and TP consultancy, education and publications.

COURSE 1
'How to get the best from IMS'

A practical seminar of five days, directed to the needs of IMS users who are seeking ways to increase the successful use of the system. The variety of tools for predicting and analysing the performance of IMS/DB and IMS/DC are examined in detail, and the output of these tools considered in terms of IMS design options. The course is best suited to Database designers and to systems programmers who have some experience in the use of IMS.
This course can be specially tailored for your installation.

COURSE 2
'IMS Internals,
A Workshop in Control and Flow'

The aim of this two week course is to educate IMS system programmers in the internal structure and flow of IMS, control block relationship and the interface with the host operating systems.
The course also demonstrates how IMS system generation options influence the structure and performance of IMS.
The whole course is specially tailored for the individual installation.
CACI has many other courses for Database and TP ranging from management assessment through data analysis workshops, distributed databases, performance measurement, etc.

Phone or write for more details:
S. Robinson, CACI, Inc., 75 Rockefeller Plaza,
New York 10019. Tel: (212) 541 6240.

Letters to the Editor

A Public Challenge to Rigo

Must Certificate in Data Processing (CDP) holders continue to ~~be subjected~~ to the verbal abuses of Joe Rigo taking a slight-of-hand slap at the certificate?

So what if Donn Parker got research monies to deal with programmers' ethics [CW, June 13]? At least he's dealing with the problem. He may not deal with it as others might, but one cannot for a minute diminish the value of Parker or his work to this industry.

So what if Jean Sammet felt the CDP was for others — or if, for that matter, the whole Association for Computing Machinery feels the CDP is for others? Did it ever occur to Rigo that they may defer because they are unable to pass the exam?

Only they know the answer to that question.

Now it's my turn. Parker and Sammet notwithstanding, I issue to Rigo a public challenge to take and pass the 1978 CDP exam — on me.

I will place on deposit with *Computerworld* a certified check for $100, payable to Rigo, and deliverable upon his showing evidence of satisfactory completion of all sections of the 1978 exam.

But wait, there's more. I shall also place on deposit with CW a second check in the same amount — this one payable to Institute for Certification of Computer Professionals (ICCP).

If Rigo is successful and I lose, ICCP will have my donation, specifically stipulated to defray the expenses of administering the exam to some worthy handicapped DPer.

But it's conditional. Rigo must deposit with CW a like sum, to be held in escrow for the same purpose should be not be successful.

If be is not successful, the price of his failure will be the $200, plus one brief article to be published by CW giving an honest evaluation of the exam and extolling its virtues.

If he is successful, perhaps he'll then have a different view.

Either way, it's time for Rigo to put his money where his pen is.

Kenniston W. Lord Jr.
Hudson, Mass.

More on 'Audit Computers'

Frankly, I am stumped by the story in the July 14 issue entitled "Audit Computers Seen 'Freeing' Auditors in Future." The majority of the text deals with the usual DP horror stories that always come up whenever DP auditors get together.

Obviously, Donn Parker thought the concept of an "audit computer" would stir up some interest.

As a matter of fact, it did, and I would like to see a follow-up story which would cover the concept in greater detail.

Fred H. Francis
New Orleans, La.

Comments on Degree Debate

In regard to Jack Stone's column in the July 4 issue, I most heartily agree with Regina Litman's comments concerning the college degree requirement of some organizations.

To me, the most unfortunate thing about this type of discrimination is not only the disservice done to the individual, but the disservice done by the hiring organization to itself and the industry.

Those DP types who work in organizations small enough to do their own recruiting and hiring know the dedicated, capable, enthusiastic trainee or professional is a rare person indeed. To me, it is inexcusable to refuse to consider such a person for lack of a piece of paper which may or may not mean anything.

Please do not let me give the impression that I do not believe a college education is valuable. Four years of education in the proper disciplines is of great value.

I also believe that years of successful experience in the real world can be of considerably more value than a diploma.

Cliff Fryda
Watertown, S.D.

No Assembler in CCP Exam

The Institute for Certification of Computer Professionals (ICCP) is very appreciative of the coverage *Computerworld* gave of our panels at NCC. However, there was a serious error in "ICCPers See Tests Best for Self-Examination" [CW, June 27].

The second to last paragraph concerning the use of IBM's Assembler is exactly opposite of true. In spite of IBM's share of the market, the Certificate in Computer Programming (CCP) does not include IBM's Assembler language in those questions that have to do with low-level programming.

In fact, no specific vendor's assembler language is used in the CCP examinations.

Philip J. Gensler
Secretary
ICCP
Chicago, Ill.

what, me?
a fiduciary?

If you have any power of control, management or disposition of any of the assets of any employee benefit fund, or make decisions about its administration, you could be held to the strict standards of fiduciary responsibility...

If you think that your personnel system isn't giving you the support you need to minimize this responsibility, better ask Joe Nestor (617) 851-4111, Wang Laboratories, Inc., Lowell, MA about a new Wang software system for 360/370, Honeywell, and Burroughs, that will...

Programming Called Wasteful

Most Runs Have Short Useful Life, Research Indicates

By Don Leavitt
Of the CW Staff

CHICAGO – Programmer productivity is a management issue more than a technical problem, and substantial amounts of programming within an installation, even using modern techniques, may be a waste of time.

In fact, management can do more by managing what is programmed, in the conventional sense, rather than managing how it is programmed, according to R.C. Kendall and E.C. Lamb of IBM's Information Systems DP Technical Planning staff here.

In a paper on Program Usage Studies distributed at the May meeting of Guide, the IBMers urged readers to reduce programming of low-usage programs, to reduce programming of short-lived programs and to use substitute methods instead of conventional programming.

Especially with respect to application programs, "install it first, program it last," they said. Most programs have a reason for being, so they should be produced, they said, but the reason is often so short-lived that a great deal of effort cannot be justified on the typical application program.

Eight Test Sites

The initial study on which the paper was based was slated to last five months. Data was gathered at eight test sites and much of it seemed to be just about what was expected; the top 10 and 20 programs in each of the shops accounted for very nearly the same amount of the total load.

When the researchers came back five months later, the percentages were just about the same, but 40% of the programs from the original lists were no longer in use. They had, effectively, died.

Two further extensions, each lasting four months, showed a comparable death rate for programs that had been among the most actively used ones when the first measure was taken. And a long-term study of a single site seemed to confirm the pattern, they said.

Ultimately, Kendall and Lamb documented what they called the churning and instability of the typical installation. There is, they saw, a high rate of development and a high "infant mortality" among programs.

An installation's program load typically has a death rate of 7% a month and the average program has a life expectancy of 14 months, they concluded.

More than that, the team found that most CPU load comes from a few programs which run frequently, but most programs do not have any effect on the load. The efficiency of application programs is clearly not a factor in total load, they added, and tuning such programs is "generally a waste of resources."

Programs typically are small, with only 4% having greater than 2,000 lines of source code and 50% having fewer than 400 lines of code.

The small size had some very definite implications in design approach and programming management, they warned. How, for example, can improved programming technologies, design reviews, code inspections and the like be applied to numerous small programs?

The small size also leads to "unitized functions" with embedded data descriptions and dependencies, they said, adding that characteristically that meant change was difficult – and dropping a program altogether might be more sensible than trying to fix it as conditions change.

Since the match of programming language to problem is "random" at best, the power of a high-level language vs. Assembler typically slips to "somewhat better than 2 to 1," rather than the usually expected figures of anywhere from 4 to 10 to 1, they added.

Just as clearly, RPG-like languages, data retrieval and inquiry facilities that can get a problem solved quickly – regardless of how efficient the solution might be technically – got tacit endorsements from the two researchers.

'Iris' Update Backs Reorganization, Use Of Nova Partitions

IRVINE, Calif. – The Interactive Real-Time Information System (Iris) software for Data General Corp. Novas and Nova-type minicomputers has been enhanced by Educational Data Systems, Inc. (EDSI). Iris 7.2 allows the user to set the size and number of partitions to be allocated, a spokeswoman noted.

There is nothing in the operating system to limit the number of partitions or the number of terminals that can be used, she claimed. Total memory size would be a limiting factor on the number of partitions; the type of multiplexer, the key to the number of terminals that could be supported, she explained.

The software allows a number of terminals handling the same task to access the same file. Provision is also made to support dynamic scheduling of low-priority tasks to ensure that all users receive service within a specified time interval, she added..

Iris has been redesigned for easier updating, she said. All Basic programs under the 7.2 version are position-independent, permitting the user to make system changes without having to dump the system onto a mag tape or disk.

The Iris supervisor requires 16K and the system can be used with minicomputers having 64K to 128K of main memory. Iris costs $2,800 in single units, but requires a business Basic system from EDSI – for another $800 – to be immediately useable. Other software for "Asgol," edit routines and Assembler-level coding are also available, the company said from 1682 Langley Ave., Irvine, Calif. 92714.

'Poor Man's TSO' Has Features Of IBM Software at Lower Cost

PORTLAND, Ore. – OTS from JLB Systems is sometimes referred to as a "poor man's TSO," according to a user, because it supports many of the facilities of IBM's Time Sharing Option, but with much lower system resource requirements.

Operationally, OTS is a multitasking extension of IBM's Operating System which uses common teleprocessing techniques to achieve good response time and efficient computer utilization, a vendor spokesman claimed.

Its purpose is to increase the productivity of the application programming staff, the systems programmers and the operations control function. It is even used occasionally by non-DP people for data entry, he noted.

The software provides a full screen editing, internal reader job submission, data set and catalog management and print file viewing. It also backs a limited command language, dynamic data set allocation and operator communication, he said.

It is, according to the spokesman, an efficient and comprehensive program development tool that allows "in context" editing of source programs, JCL manuals and documentation using local or remote 3270 terminals and operating under OS and VS systems.

The efficiency is such that the software can function with a minimum of 55K whereas IBM's TSO requires "something like 200K." OTS also functions with 3% to 5% fewer CPU cycles than TSO, he said.

Increased productivity is achieved through faster test turnaround, higher quality maintenance and just plain better control over programs and documentation, he added.

The system includes an interface to The Librarian from Applied Data Research, Inc. and this linkage apparently could be extended to other library systems.

OTS can be acquired for a one-time cost of $5,000 or $250/mo from the vendor at 3930 S.W. Kanan, Portland, Ore. 97221.

Billing System Set to Monitor PDP-11s Running Under RSTS/E

BOSTON – A job accounting and billing system for the Digital Equipment Corp. PDP-11 under version 6A or 6B of the RSTS/E operating system is now available from Mark/Ops.

The system is based on "snapshots" it takes of users who are attached, on-line to the minicomputer. The package collects such data as collect time, CPU time, language in use, program name in use, peripherals assigned to a job, job number and keyboard number, according to the vendor.

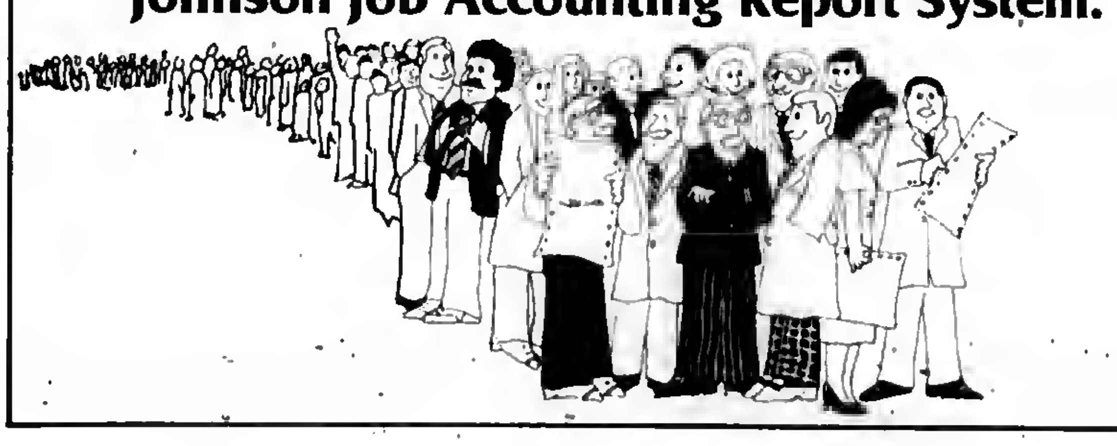
An additional feature is a Mark/Ops modification of the DEC-supplied "LOGIN" utility. This allows the user a session identifier which appears chronologically and as a subtotal on a monthly bill, the spokesman noted.

The billing system also collects storage use, by day, and reports it. Beyond that, there is a facility to use all the data collected for a range of management reports keyed to system utilization, he said.

The billing data is taken at six-minute intervals and reduced at the end of the day. A rate structure varying with time of day and day of the week is possible, the company added.

Users appear to be protected against bad billing with this system. A recovery procedure "assures" billing data capture even after a system crash. Systems in which crashes occurred are captured and flagged on the user bills, the spokesman noted.

The package cost depends on whether the user is commercial or educational and on the number of copies ordered, Mark/Ops said from 475 Commonwealth Ave., Boston, Mass. 02115.



Join the more than 1000 DP Managers now using the Johnson Job Accounting Report System.

Data Administrator Encompasses Functions of DBA

By Stephen L. Robinson
Special to Computerworld

Data Base Corner

Much has been written about the management of data base systems. The sources of such literature span the spectrum from business school academics to system programmers, from managers of management information systems to DP directors, from vice-presidents to analysts.

Out of all this frequently contradictory literature, we shall endeavor to distill an essence of sanity.

As with any subject, tracking the evolution of today's terminology may be useful in clarifying the problem. The development of a data base system requires not only a recognition of the true nature and scope of the objective system, but the creation of a team of management and technical personnel to plan and monitor the transition process.

In the early days (four or more years ago) of data base, it was fashionable to talk about a single individual, usually called a data base administrator (DBA), who would control the entire effort. The DBA concept was not only implemented in many organizations, it was preached by virtually all of the active data base consultants and lecturers (yours truly among the group).

This "oberfuhrer" system got a real workout in the cold, hard business world. After several years of field trials, the concept was found wanting. Too few supermen/superwomen could be found who could juggle a complete data base system environment.

Indeed, there seems to be a question whether one person, no matter how super, can manage all of the activities.

The original concept of data base administration spanned technical and executive skill areas; tactical and strategic planning, computer and noncomputer problems. Many DBAs, recognizing the problems they faced, were instrumental in creating a position of assistant DBA within their own data base adminstration group.

The DBA retained the executive and strategic responsibilities for the data base system while the assistant DBA absorbed the tactical and technical responsibilties. This division follows rather closely a distinction, suggested several years ago, between a data administrator and a data base administrator.

Terminology being what it is, the mapping is as confusing as possible; the term "data administrator" corresponds to the executive and srategic aspects of the old DBA designation, while the term "data base administrator" corresponds to the technical and tactical aspects of the old DBA designation.

Since data base systems are an evolving phenomena, the management of such systems is still changing. As more organizations try different management structures, we will learn more about how a data base system can best be managed.

In the interim, we present the following thumbnail sketches of data base administrator and data administrator. In future "Data Base Corners" we will discuss major tasks of these two offices in greater detail.

Data Base Administrator

The DBA is responsible for the physical well being of that part of the data base which is stored on a computer. The DBA therefore possess the combined skills of a system/programmer/analyst and a computer analyst.

He should ideally have had a major role in the selection of a data base package, teleprocessing package and a data dictionary package. (It is recognized that in many organizations some of the aforementioned selections would fall under the aegis of an existing systems group.)

The DBA, in conjuntion with computer center management, will establish the configuration for data base processing (e.g. for batch, message, etc.). The DBA staff will be responsible for the security and integrity of the data base and the data base package.

The DBA group designs both schemas and subschemas (physical and logical data bases) and serves as consultant to application programmers and analysts on the proper use of the data base system.

In summary, this is a technical office, devoted to the day-by-day aspects of the data base operation as well as the planning for technical expansion and enchancement. This group has minimal involvement with end users.

Data Administration

Data is a corporate resource. It is expensive to gather, maintain, organize and use.

Heretofore most organizations have derived minimal return from their investment in data. As noted in earlier articles, this is primarily due to the file system philosophy of data organization.

Under this philosophy data elements "belong" to an application rather than possessing, as an attribute, those applications which require it.

The data administration group is responsible for inverting the sense of present file systems and creating a true data base system. The major tasks of data administration are:

- Documenting and analyzing existing data systems.
- Assessing data and information requirements.
- Developing a model of the organization's data.
- Planning for the sharing of data.
- Developing new data entry procedures, forms, etc.
- Working with "users" who require information.

Note that data administration involves many noncomputer-related aspects of DP. This group should not be confused with a management information system group, which is primarily concerned with using the data base to develop models and reports for the benefit of management decision making.

Clearly these have been only brief outlines of the two functions to merely identify the characteristics of the areas. In future columns we will address each area in some detail.

The intent of the forthcoming columns will not be to set down absolute job descriptions, but to present the state of evolution in various organizations.

Lecht to Speak in L.A.

CHICAGO — Charles P. Lecht, author of *The Waves of Change*, will be the keynote speaker at a two-day conference for DP trainers sponsored by Advanced Systems, Inc. (ASI) in late September at the Marriott Hotel here.

Workshops covering a range of subjects will also be part of the program, a spokesman noted.

For those registering in advance of the Sept. 26-27 meeting, the cost is $80, but registrations at the conference itself (for $95), "are also welcome," he said from ASI offices at 1601 Tonne Road, Elk Grove Village, Ill. 60007.

WANTED

FOR PROGRESSIVE NCR CENTURY AND CRITERION USERS

PASS/3

A NEW DEVELOPMENT LANGUAGE

DESCRIPTION
Designed exclusively for NCR installations, PASS/3 is a complete software system that does 100 % of all system development.

RECORD
PASS/3 has been proven to:
-Reduce initial coding effort by 85 - 95%
-Reduce program maintenance effort by 85 - 95%
-Provide standardized coding and documentation
-Provide more time for creative analysis
-Improve department morale
PASS/3 is currently used by a variety of industries and internally by NCR.

REMARKS
PASS/3 should be considered highly effective. It is available on a rental or license program at a surprisingly low cost.

For Information Contact:

Syncsort vs. 5740 Release 3

User Picks Independent Sort Based on IBM-Run Tests

By Don Leavitt
Of the CW Staff

SALEM, Ore. – Benchmarking a software product – actually running it to see how well it does against expectations or against the performance of a functionally comparable product – has long been recognized as one of the better screening techniques. And lately a number of installations around the country have been using benchmarks to assess different sort systems.

The choices differ depending on the user's system and needs, but large-scale IBM shops now have a choice that includes at least IBM's older sorts, its latest – Release 3 of the 5740-SM1 product – and Whitlow Computer's Syncsort.

There have been reports of a number of Release 3-Syncsort confrontations ever since the IBM product was introduced earlier this year [CW, April 11]. One of the most unusual of these exercises was run here at the Oregon Department of Transportation data center in May.

The details of the test results were substantial enough so that the department's software specialist, Dewayne Theissen, sent them along to management when he requested permission to purchase Syncsort. But the results were not the high point of the tests, in his view; the way the tests were run was equally significant to Theissen.

He laughed when he was asked whether it was someone from his organization or from Whitlow that had run the tests. "Neither," he said, "it was our IBM system engineer [SE] . . . Now there's an objective source for an evaluation."

Representative Mix

The tests took place largely because the department had reached a point where it felt it needed a better sort than it had. Six different state agencies use the department's 370/158 with 3M bytes of memory, running under OS/VS.

The SE was asked to run tests comparing Syncsort – which Theissen and others had read about – with the sort then in use. The results were very favorable to the Whitlow product, but then Theissen heard about the updated version of IBM's 5740 sort, and he felt he had to give it a try.

So he asked the IBM technician to run parallel sorts using Syncsort and the 5740 Release 3.

The sorts were a representative mix of the department's workload, he said. There were about 16 different files to be sorted and the SE set them up in different ways, at different times of the day and on different days of the week to be sure neither package had an advantage by accident of when it was run.

Generally working with a 128K sort region, the SE set up short, mid-range and long sort tasks. Most of the records were fixed-length format, although variable records were also in some of the tests.

Some of the records were 30 bytes long; others had 2,000 or more bytes. And volumes were equally diverse. Some of the jobs involved only 3,000 to 4,000 records; others ranged up to 3 million to 4 million, Theissen said.

'Tremendous' Improvement

Even though he had no specific data on what improvement the Whitlow sort provided, even compared with IBM's Release 3, the department's spokesman characterized the improvement as "just tremendous" and leading to cutbacks in both wall clock time and CPU time.

The comparative stability of the product also impressed Theissen. He said the IBM SE couldn't use the Release 3 package he brought with him for the tests. It wouldn't run until he made several "fixes" to the basic coding.

Theissen was also impressed with the way Syncsort compensated for "trivial" operator errors – a slight mistake in the job control statements, for example – and kept going, whereas "Release 3 just plain bombed" when faced with the same flaws.

Release 3 proved a vast improvement over the department's earlier sort, Theissen said. The IBM update beat Syncsort twice, he recalled, but Syncsort topped the performance of the IBM release 13 times.

"When you got right down to it, almost regardless of what the SE did to get Release 3 in a good light, Syncsort outperformed it." And the IBMer admitted it after a while, Theissen said.

Metro Access Grows On GE Mark III Net

ROCKVILLE, Md. – General Electric (GE) has expanded the Metro Access capability of its Mark III remote computing network both geographically and in services available.

For the past year, Metro Access services have been available in New York, Chicago, Los Angeles, Cleveland and Washington, D.C. As of July 1, the services became available in Boston, Atlanta, Dallas, Schenectady, N.Y. and San Francisco.

Previously, Metro Access supported 1,200 bit/sec full-duplex service, 4,800 bit/sec service and GE's telephone information processing service based on input from tone-type telephones, all linked into Mark III data centers.

The services have been expanded to also support 110- and 300 bit/sec service, a recently introduced data entry mode service and 2,400 bit/sec service in each of the 10 metropolitan areas now covered.

Headquarters for the Mark III network is at 401 N. Washington, Rockville, Md. 20850.

Pansophic Cuts Prices

OAK BROOK, Ill. – Pansophic Systems, Inc. has slashed the prices of its software products for installations using low-order IBM 360 and 370 CPUs.

This policy brings Panvalet, for example, down to $2,980 instead of the full cost of $4,980, a spokesman noted.

Pansophic is at 709 Enterprise Drive, Oak Brook, Ill. 60521.

Ampex memory for PDP-11/70. Spend less, get more.

Add Ampex memory to your PDP-11/70. You'll get better performance than you would with DEC's own memory, and you'll only spend around half as much money.

Money isn't the only thing you'll save with Ampex memory. You'll save time, too. Using four-way interleaving, effective cycle time of an ARM-1170 memory is 350 nanoseconds. Even without interleaving, Ampex memory cycles within 725 nanoseconds.

Ampex ARM-1170 memory comes in increments of 128K bytes and can expand a PDP-11/70 computer all the way to 4 megabytes.

DEC has a great product in the PDP-11/70. And now you can make yours work even better, and save some money at the same time. Order your PDP-11/70 memory from Ampex and get it now.

The only connection between Digital Equipment Corporation and Ampex Corporation is the one you make yourself when you plug our memories into their computers

Ketron Selling MPS III For Linear Programming

ARLINGTON, Va. — MPS III, a mathematical programming system designed for use with applications involving large or complex linear programming (LP) models and associated data bases, is now available from Ketron, Inc.

Previously supported by Management Science Systems, Inc., the software is packaged for in-house use on large-scale IBM or Amdahl CPUs and is available as a service on various remote computing networks, including General Electric's Mark III, National CSS and McDonnell Douglas Automation facilities, according to a spokesman.

The basic system includes control and standard LP optimizer capabilities. Options include Dataform, a data management subsystem developed specifically for management science problems. It supports matrix generation, solution analysis and report writing.

Other options include Whizard, which solves LP models entirely within main or virtual storage; GUB, a generalized upper bounding facility that solves certain classes of LP models; and Lockbox, a facility location optimizer, the spokesman said.

Another option, Mistic, is said to solve mixed-integer models while Quad resolves quadratic problems.

Written in BAL, the basic system is available under a paid-up license for $6,000. Dataform costs an additional $24,000; Whizard, $13,500; GUB, $22,000; and Mistic, $6,000.

Monthly leases are also available, Ketron noted from the 12th floor of the Architect Building, 1400 Wilson Blvd., Arlington, Va. 22209.

ISE Sets Meet

SAN FRANCISCO — The first national conference of the Institute for Software Engineering (ISE) will be held Aug. 10-12 at the Del Webb Towne House here, according to the meeting's general chairman, Ed Prichard.

The conference program will range from reports of "very specific achievements" in capacity management using software physics to more general presentations exploring various aspects of software engineering, Prichard said.

Although the conference is geared to the interests of institute organizations and most of the papers will come from these groups, the meeting is open to anyone interested in the general subject area and the program will include a number of papers from nonmembers, Prichard noted.

Registration fees — $85 for ISE members and $135 for others — cover session attendance, a copy of the conference record and a ticket to the conference luncheon.

Other information is available from Don Madden at the institute, P.O. Box 637, Palo Alto, Calif. 94302.

'X2C' Features Enhanced

FAIRFIELD, N.J. — Capabilities added to X2C, the data management system on the Rapidata, Inc. remote computing network, enable users to create complex structured data bases through "simple, English-language" instructions, according to the vendor.

The modifications provide users with more direct access to DBMS-10, the data base management system running on the firm's Decsystem-10s. The standard X2C syntax defines all data relationships required to set up a Codasyl-type hierarchical or network data base, a spokeswoman noted.

Updating and data maintenance capabilities, also added to X2C, make it possible to interactively add or modify information in an existing data base, she added. If large numbers of updates are to be done, however, they can now be batched.

String manipulation functions — another range of enhancements — include facilities for concatenating and dissecting strings, pattern matching, character location, justification, blank-trimming and character set replacement.

Rapidata expects these functions to be used for interactive command parsing and easier selective data retrieval, she explained.

Charges for using X2C are based on the network's standard resource usage costs. Off-peak or batch processing can be used to cut updating and report costs, she said from Rapidata's offices at 20 New Dutch Lane, Fairfield, N.J. 07006.

SDS Adds Data Bases

SANTA MONICA, Calif. — Two data bases have been added to those already available through the computerized retrieval service offered by System Development Corp. (SDC), adding access to almost 50,000 recently published articles, journals and books on business and management.

Users working with their own terminals can reach the data bases, called Accountants Index and Management Contents, by local dial-up phone connection to the SDC center, a spokeswoman noted.

Compiled by the American Institute of Certified Public Accountants, the Accountants Index includes material published since January 1976 and covers such areas as accounting, auditing, data processing, financial reporting, taxation and investments, she said.

Management Contents, produced by Management Information Services, provides access to articles published since September 1974.

The company is at 2500 Colorado Ave., Santa Monica, Calif. 90406.

Composer Linkage Grows

PLAINVIEW, N.Y. — Software is now available for the Varicomposer I to permit its use with Linofilm Europa and Domestic ACM-9000 as well as other phototypesetters, according to Varisystems Corp.

The composing and editing system, built around Varisystems' own 32K minicomputer, can perform four different functions simultaneously including disk I/O, hyphenation, justification and editing and, "if required," hard-copy printout, a spokesman said.

Using software to interface with various systems eliminates keyboard changes. The "soft" approach also supports forward and backward scrolling through the floppy disk-based file to check or change copy before it reaches the phototypesetter, he said.

Data on the Varicomposer I and the new Linofilm and ACM-9000 programs is available from Shefra Graphics Ltd., AG Slough, England, or from the Marketing Department, Varisystems Corp., 80 Skyline Drive, Plainview, N.Y. 11803.

Deltak Course Trains Trainers

SCHILLER PARK, Ill. — Designed for individuals at DP installations who will be responsible for guiding others taking Deltak courses, "Learning Reinforcement: Tutoring" is a two-part multimedia course that requires two and a half to three hours of study.

Concepts in this particular course have some value for those dealing with materials from other audiovisual vendors, but it is primarily keyed to approaches described in guides to Deltak's own subject matter courses.

"Learning Reinforcement: Tutoring" is available through the company's Resource 12 library rental program or can be purchased separately, Deltak noted from 9950 West Lawrence Ave., Schiller Park, Ill. 60176.

Abend-AID UPDATED FOR MVS

Now, MVS Users can enjoy the same benefits from Abend-AID Release 2 as our current OS/VS Customers have been experiencing for over two and one half years.

Abend-AID is the indispensible software package which analyzes abnormal terminations and provides the User with an English text problem description and all information required, and in most cases eliminates the waste of printing a large abend dump.

Abend-AID for MVS, can still be installed quickly, (usually 10 minutes) and is still totally transparent to the User while offering complete control.

Because Abend-AID reduces the cost and improves programmer productivity, Users report that the packages "pays for itself in three months".

Join the growing list of satisfied Users who are saving time and money with Abend-AID. A free 30 day trial to demonstrate the outstanding benefits of Abend-AID is offered.

A Distributed Processing Necessity

Source Data Entry Pushing Terminals Into Mainstream

By Stephen Robinson
Special to Computerworld

The evolution toward distributed data processing (DDP) is resulting in greater integration of the terminal business into the mainstream of the DP industry. That integration is based on a single fundamental concept — source data entry (SDE).

DDP is based on the concept of establishing processing elements of an appropriate size at the best locations for any particular organization. SDE simply implies providing user-oriented input/output elements to the people within an organization who create the data to be processed.

The benefits of SDE are derived from the opportunity it provides to create a "dialogue" betwen the element (in this case, a terminal) doing the machine encoding and the person who created, and therefore understands, the data being collected.

For each added step between the creator of the data and its encoding, the error rate increases and the cost of detecting and correcting the errors rises proportionately. Avoiding these errors and costs has driven users first from traditional data entry methods such as the keypunch and later from key-to-disk media devices (tape, disk, diskette, cassette), where the entry of data is separated physically from both the source and the computer, toward greater use of SDE techniques.

Key to Success

The key to success in implementing SDE systems lies in the ease with which the operator, with minimal training, can interact with the terminal.

Two basic principles govern any SDE situation. The source (operator) must be able to confirm that the terminal correctly encoded and labeled the data entered. The terminal must ensure that the data was entered in proper form by executing a series of tests for the type of data expected.

Any errors detected can be corrected immediately because the creator of the data — the operator — is present. Those familiar with the situation in which data is received from a source — for instance, a person on the telephone — and then encoded in a separate step will recognize the importance of this seemingly simple improvement.

These principles must be implemented in a way that conforms conveniently to the user's way of doing business and enhances his efficiency. The system must be flexible enough to adapt to the user's specific requirements — not the other way around.

Operator/terminal interaction usually comes under the control of programmers in a DDP environment. User organizations ultimately determine the quality of this interaction either by selecting vendor-provided features or by creating additional controls (access methods, formats, procedures and checks) that are tailored to the particular data being collected.

In the marketplace this has led to demand for systems with more local programming and communications capabilities — in other words, intelligent terminals and specialized software.

Range of Options

Many vendors currently are moving to provide distributed systems terminals. These include:

- Intelligent terminal vendors.
- Key-to-disk (-tape, -cassette, -diskette) manufacturers.
- Interactive terminal vendors.
- Minicomputer manufacturers.
- Batch-oriented remote job entry.
- System houses.
- Mainframe manufacturers.

The problem for the user is to select a vendor whose products and expertise best match those required for his particular implementation scheme and one that offers flexibility for tailoring to his applications.

In the last decade, industry- or application-specific terminals were designed for very specialized uses. This specialization forced both the user and the vendor to amortize the development costs over a limited number of units.

Recent years have seen a move to microprocessor-based terminals in which most customization can be accomplished via the microprocessor software. Such terminals are significantly more flexible and adaptable.

However, changes in their function still require either vendor assistance or sophisticated users with staffs capable of microprogramming. Other drawbacks with microprogramming are the lack of higher level languages and the limited power of the microprocessor.

The minicomputer-hased terminal, on the other hand, can be adapted for use in specific industries, such as airlines, banks, manufacturing and hospitals, with software written in Cobol, Fortran or other standard languages. This type of terminal is very flexible, since it can run a variety of programs concurrently and can also be used as a general minicomputer to process local applications.

DP departments are showing increasing concern for the effectiveness of their solutions as they begin to implement systems that interact directly with higher levels of their management. These departments no longer enjoy the old security blanket of being the exclusive link between their computers and top management.

With greater dependence on terminals by persons who are not DP specialists, reliability and ease of use become more critical. Lack of these qualities is magnified in situations where the users are highly visible to their own customers — nurses, bank tellers, manufacturers' or distributors' representatives or clerks at checkout counters, for example.

SDE also provides a ready solution to the administrative problems of today's "consumer revolution" because terminals permit data entry while the data source (the consumer) remains available, in person or on the telephone, for corrections during the process.

The emphasis will not remain on the technological differences hetween various products used to collect data. The 1980s will see even greater movement toward market-driven products where functionality and flexibility will be of prime importance.

And data entry will be seen not as an adjunct to the DP arena, but as a key element of it.

Robinsan is manager far market planning/-terminals, Honeywell Informatian Systems, Inc.

For T/S Applications

HP Unveils Four-Color, Compact Graphics Plotter

PALO ALTO, Calif. — Hewlett-Packard Co. has introduced a four-color, portable graphic plotter for use in time-sharing applications.

HP 7221A Four-Color Plotter

The Model 7221A features RS-232C compatibility and plugs into a terminal. The plotter bed is 11- by 17 in.

A microprocessor that is also used in the HP 9825 calculator drives the stepper motor and optimizes the use of communications, according to the firm.

The unit has a built-in buffer memory of 1,150 characters expandable to 3,086; internal alphanumeric character, arc and circle generation: and user-defined dashed line patterns.

Up to 64 macro instructions can be stored at one time, the firm said.

Like the company's Model 9872 plotter, the 7221A selects the appropriate pen from a bank rather than carrying them on the arm.

Transmission rate is switch-selectable from 75 to 2,400 bit/sec. The 7221A features parity control and half- or full-duplex mode.

The unit can be operated in local mode, writing characters typed on the terminal keyboard. Upper and lower case printing is available.

Self-Test Diagnostics

The 7221A has a self-test feature which runs diagnostics without the aid of a computer and which pinpoints the fault in over 90% of instances, enabling a user to tell HP what part is needed, a spokesman claimed.

The test feature takes about 500 words out of the micro's 6K operating system, he said.

The internal character generator contains six fonts and the 2.5mm-character plotting speed is typically 3 char./sec, according to the firm.

A single command defines a circle in either direction and angles of rotation can be specified to up to .06 degrees resolution. Plot resolution is programmable to .025mm, according to the firm.

The stepping motor is controlled to .008mm at full pen speed of 36 cm/sec, the spokesman added.

Software Library

A library of 80 Fortran subroutines is available for HP 1000 and 3000 series computers, of which 52 are accessible to users. About five of these are similar to those used with incremental plotters, the spokesman said. The HP Plot 21 package sells for $50.

The library is also available on the General Electric Mark III time-sharing network and will be available on others also, HP said.

The plotter costs $4,600; it is priced at $4,825 with an expanded data buffer. The unit is manufactured by the San Diego Division, a member of HP's Instrument Group.

Delivery will start in August, HP said from 1507 Page Mill Road, Palo Alto, Calif. 94304.

Distributed System Relieves Tellers' Writing Burden

READING, Pa. — Tellers at the Conrail/Amtrak Federal Credit Union have written neither checks nor receipts since the installation early this year of a distributed DP system that utilizes communications printing terminals.

The system links Conrail's main office here and a branch in Philadelphia with dual IBM 370/168s at the central data center in King of Prussia. It is leased and serviced by Comteck, Inc., a subsidiary of Shared Medical Systems.

Conrail/Amtrak's system is a far cry from the batch processing system they used previously. Until the installation of the present system early this year, tellers would bundle the day's paperwork and ship it to King of Prussia, where Comteck would process it that night.

"Not only is this a thing of the past, but we can now key in a loan in Reading and have it displayed on a CRT or printed by a printer terminal in our Philadelphia branch office," according to Conrail/Amtrak's assistant treasurer, Hiester Haeseler.

"It was a big step for us. From a manual operation where every check and receipt was typed by hand, we've gone to one where the teller enters a transaction, pushes a single key and the check is imprinted automatically," Haeseler said.

The Comteck credit union system is a distributed DP service which involves the shared use of the duplexed 370/168s and either in-house or shared use of Digital Equipment Corp. PDP-11/70s used as transaction processing systems.

Terminal Transactions

The DEC machines have 256K bytes of memory and disks containing 88M bytes of additional memory. The 11/70s communicate through DEC PDP-11/34s under a binary synchronous protocol through dedicated leased lines to the 370 CPUs.

Conrail/Amtrak and other credit unions tie into the DEC minicomputers located in-house or regional centers operated by Comteck.

A total of six Perkin-Elmer Data Systems Carousel 350 printing terminals located at the center here and in Philadelphia communicate asynchronously to the distributed minicomputers at 1,200 bit/sec over dedicated lines through modems assembled by Shared Medical Systems.

The imprinting of checks as well as receipts for credit union members is performed on the 350 terminals. In addition, loans can also be displayed on Beehive Medical Electronics, Inc. B100 CRTs, located at the other office, Haeseler said.

Because the printer has a split platen, checks fed on a continuous roll can be imprinted on one side while receipts are fed into the other.

To do the same job as fast without the split-platen printer terminal, Conrail would need two printers in each office, Haeseler said.

A model 310 Carousel is also used by the credit union for back-office work where documents are not required, he added.

First on System

The Conrail/Amtrak Federal Credit Union is reportedly the first credit union to go on this distributed system.

These systems are a response to both the recent growth of credit unions as an alternative to conventional banking operations and to the unique needs of credit unions, according to Bill Guiney, manager of systems and operations at Comteck.

"Credit unions handle a much greater amount of back-office work than either banks or savings and loan associations," Guiney said.

"Because the credit union's customers are typically the employees of one company, there is a heavy emphasis on payroll deductions and a substantially lower volume of cash transactions. This tends to increase the credit union's reliance on various forms to handle transactions," he explained.

In the Comteck credit union sytsem, terminals remove most of the burden of forms handling from the teller.

Comteck chose the Carousel because of its unique forms handling features. "No other terminal that we've seen has both a split platen and acceptable print quality."

Quick-Change Platen

Another Carousel 350 feature that Guiney regards as a plus is its quick-change platen. In less than a minute at the close of the business day, the split platen can be removed and replaced by a solid platen that feeds full-width, standard fan-fold paper for printing a variety of reports.

Larger credit unions would find it advantageous to have exclusive use of an on-premise transaction processor, Guiney noted. For one thing, the on-site mini gives them greater control over scheduling — to decide whether to print reports or to go on a transaction-by-transaction basis.

An in-house mini also cuts down dependence on the network staying up since the mini can operate independently of the host for long periods of time.

Finally, the in-house mini cuts down phone-line expense since communication with the host can be done with a single dedicated line, Guiney said.

In the case of local firms such as Conrail/-Amtrak, the PDP-11 is located at the same site as the central computer in King of Prussia.

Distributed Approach

Even so, Guiney said the distributed approach is an advantage. The IBM computer, he noted, is at its best when processing batch jobs. It can be very unresponsive to the real-time needs of many customers.

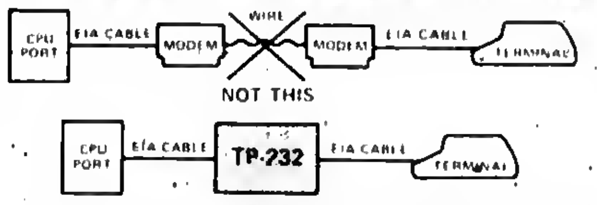
From Conrail's viewpoint, there are other advantages in using the distributed approach to processing.

For example, applications such as programming and operation scheduling were customized to their own needs. Conrail is also now able to do exactly what it wants when it wants, such as reporting and batch jobs on one minicomputer and real-time updating on another.

There was also a benefit in the speed and accuracy of check and receipt printing, the Conrail officials said.

TP-232
MODEM
SIMULATOR

The TP-232 Modem Simulator replaces a pair of modems in local, in-house applications, as shown below. With its wide variety of strap selectable options, this unit is a versatile tool for system check-out as well as an economical replacement for a modem pair.



FEATURES

- *Replaces any modem pair*
- *Synchronous or asynchronous operation*
- *Selectable data rates through 19,000 bps*
- *May be used in continuous carrier or polling systems*
- *Available in rack mount and stand-alone configurations*
- *Regenerates EIA signals allowing greater cable lengths*
- *RS-232 C compatible*
- *Digital data loopback*

DEALERS...AJ WANTS YOU

Anderson Jacobson, a leading manufacturer of data communications products, would like to introduce you to our new minicomputer, the AJ System 1500. And we need your expertise to make our small business system successful.

Here's what we have to offer:

- Good margins
- Exclusive territories
- A small business nucleus of application software at *no charge* to you
- Excellent client accounting software, also at *no charge*
- A multi-programming, multi-terminal system that is *fully* expandable
- AJ field service available in selected areas of the United States
- Floppy or hard disk systems

If your are interested in being a part or AJ's successful future, call or write Bob Reed, National Marketing Manager, for more information.

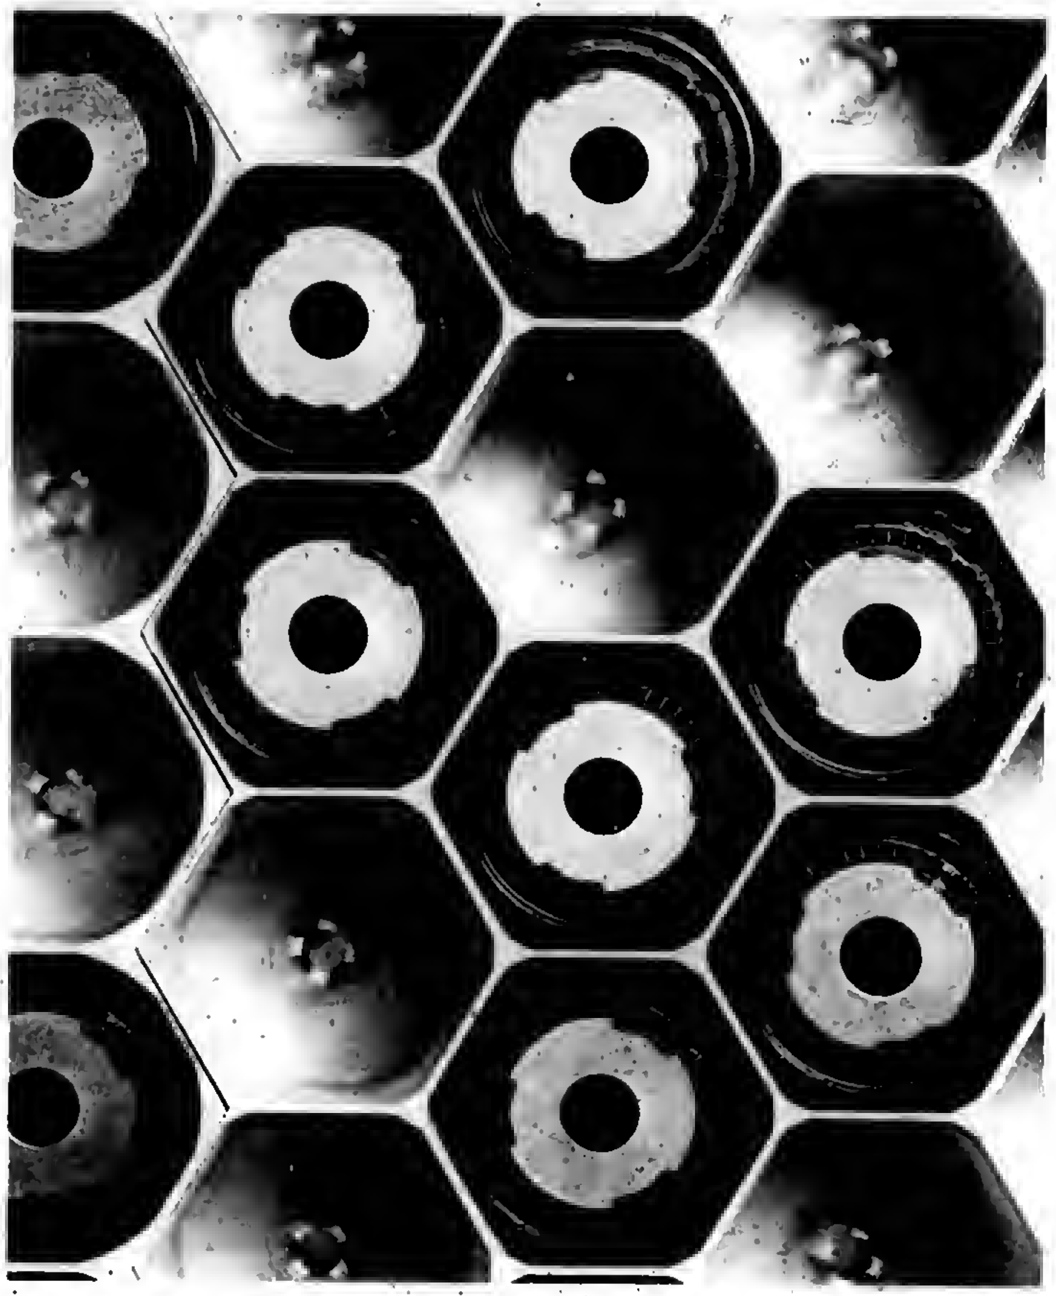
DP Dialogue

Notes and observations from IBM
that may prove of interest to
data processing professionals.



Honeycomb-like storage cells of the IBM 3850 Mass Storage System.
The MSS can put as much as 472 billion characters of data online to the computer.

3850 Simplifies Life at Dun & Bradstreet

"Our business is information," says Dun & Bradstreet's vice president, Gordon J. Aubrecht. "Every day, some 2,000 people—trained business analysts—gather that data through direct interviews with business owners. It is then our job to store, assemble, package, and disseminate it. Computers make that possible. And computerized verification and security programs help us monitor accuracy of the information while safeguarding confidentiality of the file."

The wellspring of its credit and marketing services to the business community is Dun & Bradstreet's data base on four million commercial enterprises. So the company is assured prompt access to any part of this file, D&B has chosen to use an IBM 3850 Mass Storage System (MSS), designed for the online storage of large quantities of data.

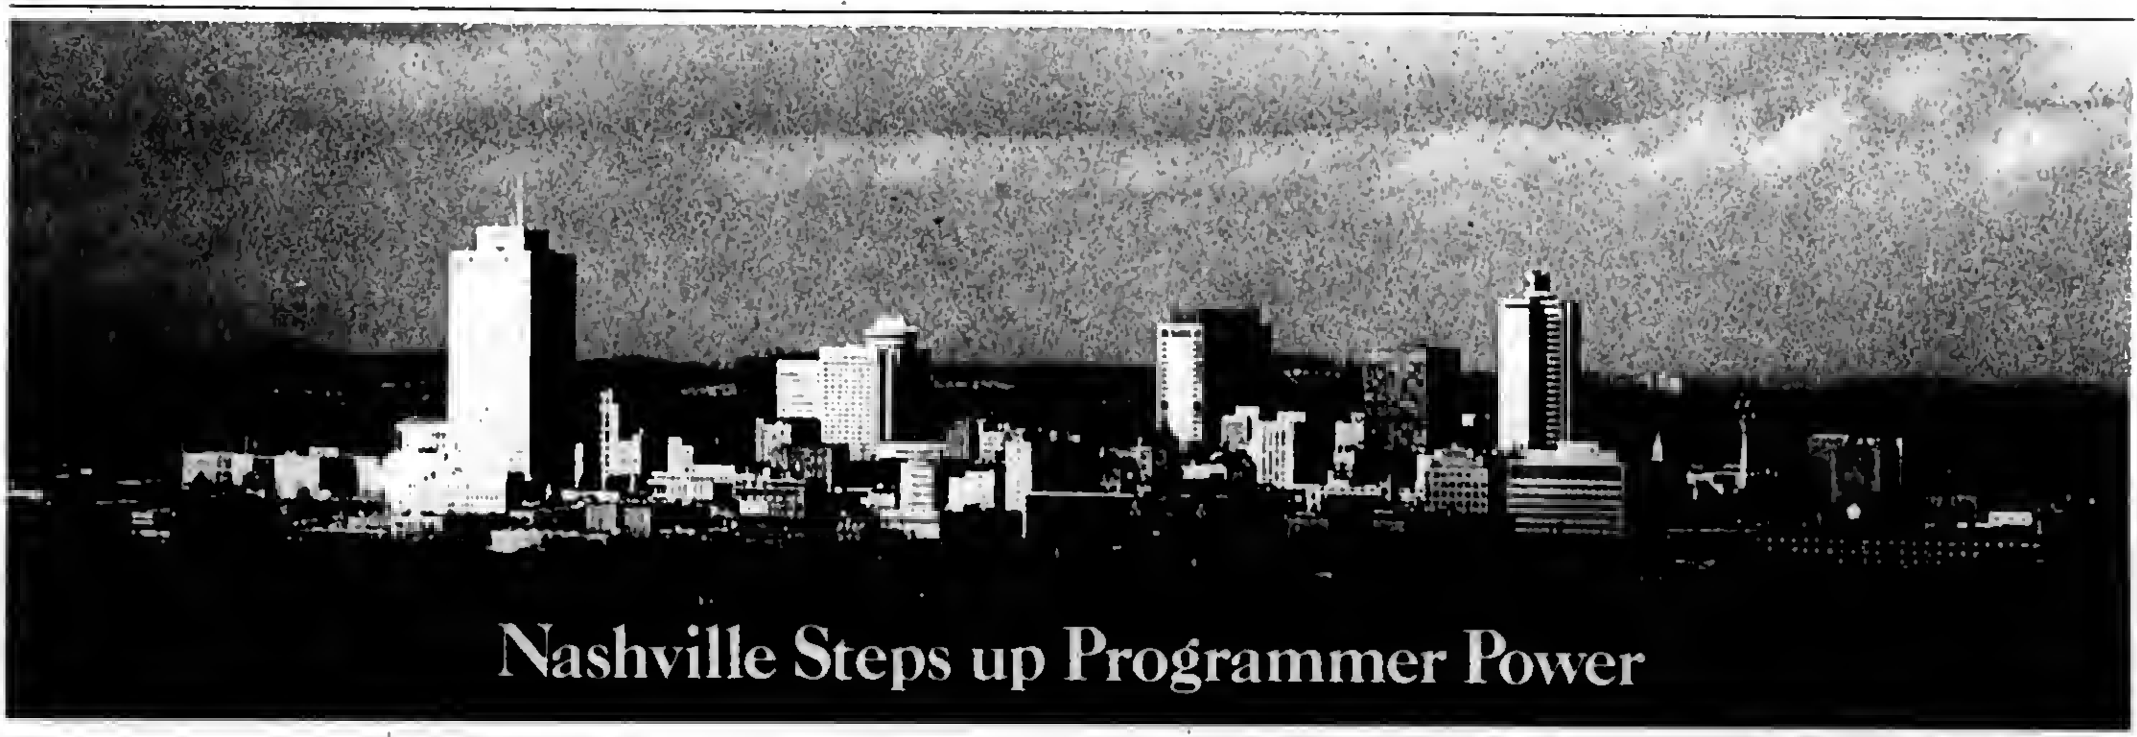
"The MSS gives us the benefits of high-speed disk storage, but at the cost of tape," Aubrecht says. "Since installation in our New York computer center, we have been able to cut back from 22 tape drives to eight, and have reduced our tape library from 22,000 reels to 16,000. And we expect that number to diminish to 8,000 before long." The center is equipped with two System/370 Model 158s.

"This file base is the foundation for many of our services," Aubrecht notes. "We computer-typeset—directly from the stored information—such publications as the Dun & Bradstreet Reference Book, The Apparel Trades Book and the Reference Book of Manufacturers. From the same file, we extract detailed, custom-tailored marketing facts, called Dun's Market Identifiers."

Adds Robert Porowski, director of computer operations and support: "The most important gain for us was the elimination of manual handling of tape. We've done away with thousands of mount/dismount operations each month and, at 2½ to 3 minutes per operation, that's hundreds of hours saved."

In the IBM 3850 Mass Storage System, data is recorded on magnetic tape enclosed in small cartridges, which are automatically retrieved by the system when required for read or write operations.

"The shift to MSS, along with other changes made at the same time, also yielded some direct hardware cost savings," Porowski added. "It's a new mode of storage, occupying a new place beside disk and tape in terms of cost and operating characteristics. By using it for the storage functions to which it lends itself—in our case, the equivalent of multiple data bases online—we're achieving important gains in performance and quality, significant cost savings and a real assist in internal operations."



Nashville Steps up Programmer Power

When the city of Nashville, Tennessee, adopted extended-area government, a metropolitan area of a half-million people was unified under one administration. One resulting efficiency is data processing service provided to the entire metro area—known formally as the Metropolitan Government of Nashville and Davidson County—from one computer center with an IBM System/370 Model 158. To increase productivity, the center uses three new aids to develop and maintain application systems.

One aid, called Hierarchy plus Input, Process, Output (HIPO), approaches program design and documentation in terms of small, functionally defined modules. Another, Structured Programming, makes programs easier to read and understand.

The third aid is Data Language/I (DL/1), an IBM data base manager. DL/1 structures data into a common format that allows many programs to access the same files, eliminating redundancies.

All three can reinforce each other to make application development and maintenance more productive.

How much more productive? Ron Dickie, director of data processing and computer services for Nashville, points out that, along with quantifiable improvements, many of the important benefits are intangible, such as improved forecasts of development times and costs.

Precise gains include a doubling of workload without an increase in staff size and using 20% to 40% less computer time to test new applications. And new programmers can write online programs after only two months of training.

"On that quantifiable basis, we identified $173,350 of costs actually avoided during the first year with the new techniques," says Mr. Dickie. "That's particularly impressive to us because it was a busy year, in which we developed seven major application systems."

Because program development now is done in a modular fashion, a programmer needs only one week, on the average, for coding and testing a program.

And program maintenance activity was greatly reduced under DL/1. "We used to spend a lot of time in rework," says Mr. Dickie. "Now we alter data bases and switch storage devices without making program changes.

"All in all, HIPO and DL/1 and Structured Programming have proved to be a winning combination. They've helped us serve our citizens better while saving some hard-earned taxpayers' dollars."

DP Dialogue is designed to provide you with useful information about data processing applications, concepts and techniques. Olivetti Brings Out 8-Bit Teleprinter Available in RO, KSR and ASR Versions

NEW YORK — Olivetti Corp. has introduced an 8-bit teleprinter that is available in three versions — receive-only (RO), keyboard send/receive (KSR) and automatic send/receive (ASR).

The basic Olivetti TC 480 for sending and receiving messages can be upgraded with optional I/O units and memory to an interactive terminal for on- and off-line data collection, time-sharing, batch communications, limited text editing and word processing, according to the firm.

The basic terminal is equipped with a standard TTL serial interface for local connections. For communications, it can be optionally equipped with a variety of interfaces including RS-232 and current loop, which allow communications at four operator-selectable speeds from 75- to 1,200 bit/sec, Olivetti said.

In the optional communications mode, the teleprinter communicates asynchronously in Ascii code in a 10- or 11-unit character structure, the firm added.

The TC 480 keyboard generates the 128-character Ascii set. An optional numeric pad is available to facilitate numeric data entry as well as dialing remote terminals over switched lines, it noted.

The device prints 7 by 9 dot-matrix characters at speeds up to 30 char./sec, Olivetti said, adding up to 132 char./line and up to 64 characters can be stored in memory when the terminal is in receive mode.

A horizontal and vertical tab option stores seven tabulation programs in erasable programmable read-only memory (Eprom).

In addition, one priority program resident in optional random-access memory (RAM) can be stored through the keyboard,

Terminal Transactions

from the line or from the optional I/O units, the company noted.

Optional I/O units include an 8-channel tape reader and combined reader/punch, an integrated double magnetic cassette unit with storage of 160K bytes, a built-in minidiskette with an 8K-byte capacity for text editing and an 8K byte RAM for additional editing.

The TC 481 receive-only (RO) terminal is priced at $1,625. The TC 485 KSR costs $1,750.

The tape reader/punch costs $800. The cassette unit can be added for $1,200, the minidiskette for $1,050 and the additional 8K RAM for $900, according to a spokesman, who added the options can be factory or field installed.

RS-232 or 20mA current-loop interfaces cost $100 and $120 respectively, he said.

The terminals will be available in September from Olivetti at 500 Park Ave., New York, N.Y. 10022.

Printer Made for 3270 Types

ANN ARBOR, Mich. — Interface Systems, Inc. (ISI) has brought out a multifont printer that it said can print characters ranging from .1- to .7 in. high from the screen of an IBM 3270 or compatible CRT terminal.

The 4100SC is plug-compatible with IBM 328X printers. It can also print a variety of standard bar codes on 8-in. lines and can print at speeds up to 120 char./sec, according to the firm.

Applications for the 4100SC include materials handling and warehouse systems.

The printer is priced at $6,400 from ISI at 462 Jackson Plaza, Ann Arbor, Mich. 48103.

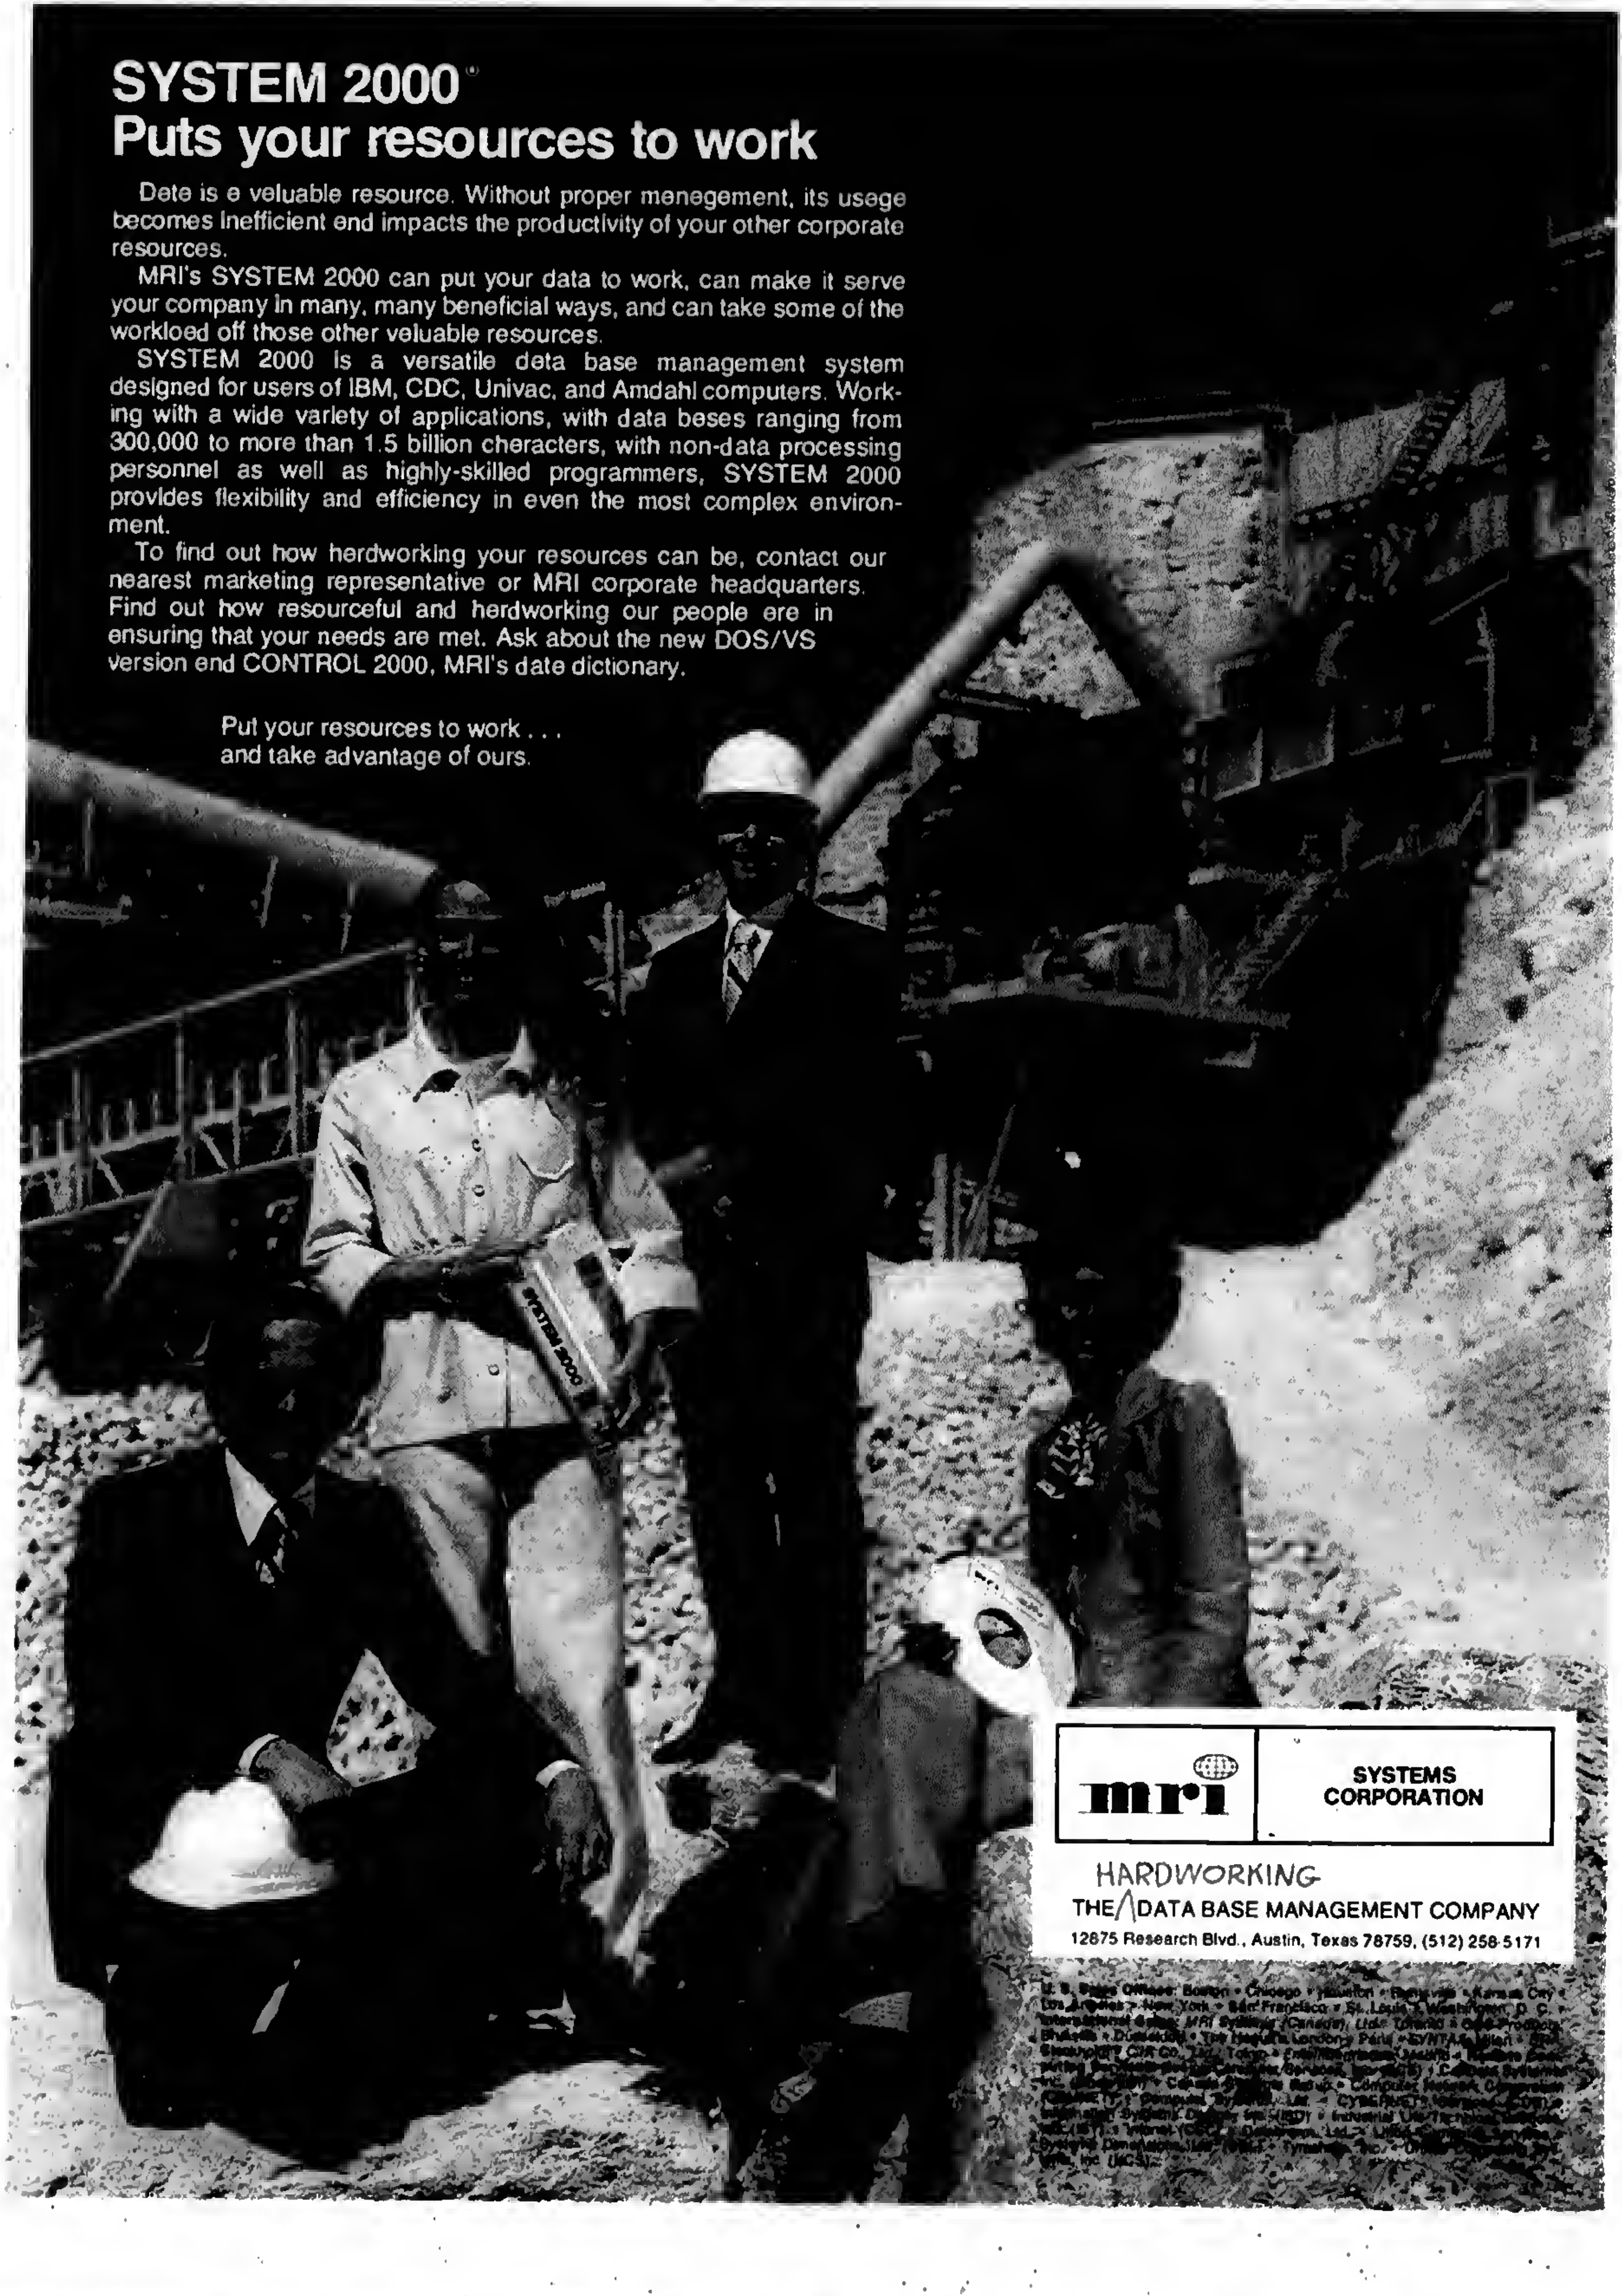
CPT Micro-Based Unit Aimed at Office Sites

HOPKINS, Minn. — CPT Corp. here is offering a microprocessor-controlled, Selectric-type terminal for office communications.

The terminal is said to be compatible with a variety of line disciplines. In its standard configuration, it enters and receives Ascii data asynchronously at transmission speeds up to 300 bit/sec, CPT added.

The unit is also plug-compatible with the serial I/O port of calculators and computers.

The terminal costs $2,500 from CPT at 1001 S. 2nd St., Hopkins, Minn. 55343.



SYSTEM 2000®
Puts your resources to work

Date is a valuable resource. Without proper management, its usage becomes inefficient and impacts the productivity of your other corporate resources.

MRI's SYSTEM 2000 can put your data to work, can make it serve your company in many, many beneficial ways, and can take some of the workload off those other valuable resources.

SYSTEM 2000 is a versatile data base management system designed for users of IBM, CDC, Univac, and Amdahl computers. Working with a wide variety of applications, with data bases ranging from 300,000 to more than 1.5 billion characters, with non-data processing personnel as well as highly-skilled programmers, SYSTEM 2000 provides flexibility and efficiency in even the most complex environment.

To find out how hardworking your resources can be, contact our nearest marketing representative or MRI corporate headquarters. Find out how resourceful and hardworking our people are in ensuring that your needs are met. Ask about the new DOS/VS version and CONTROL 2000, MRI's data dictionary.

Put your resources to work . . .

Bits & Pieces

Memorex Introduces Line Of Double-Density Floppies

SANTA CLARA, Calif. — Memorex Corp. is offering a line of double-density flexible disks for use with its models 550 and 552 and equivalent flexible disk drives.

Three double-density Markette configurations are available: a soft-sector, single-sided disk with a storage capacity of 3.8M bits; a soft-sector, dual-sided unit with 7.6M-bit capacity; and a disk with 32 hard sectors and a 6.4M-bit capacity. All of the disks feature 77 track/side.

As a result of a proprietary surface coating, the disks perform at least 10% better in terms of bit shift and show a 20% improvement in signal resolution over competitive media, a spokesman claimed.

Markettes cost approximately $75 for a carton of 10, he added from the firm at San Tomas at Central Expressway, Santa Clara, Calif. 95052.

Verifier Reads ABA Code

DALLAS — American Magnetics Corp. introduced a Magstripe Verifier here recently that reads and displays encoded American Bankers Association (ABA) data on magnetic stripe cards.

The unit, which has a 38-digit LED display, allows users to see what is encoded on the magnetic stripe and to verify that the card is encoded to ABA standards.

The $1,495 verifier is available from the firm at 2424 Carson St., Torrance, Calif. 90501.

Punch Has Protective Case

CUMBERLAND, R.I. — The Digitronics Division of Comtec Information Systems, Inc. has a 75 char./sec punch mounted in a protective suitcase.

The P 8075/B punches 5- to 8-level data on 1-, 7/8- or 11/16-in. wide paper or mylar tape. Punching tolerances exceed RS-227A requirements, the firm claimed.

The punch sells for $1,995, from the firm at 53 John St., Cumberland, R.I. 02864.

Pericomp Has Tracking Tape

NATICK, Mass. — A prerecorded tape that allows users to verify tape tracking has been introduced by Pericomp Corp.

The tape allows users to utilize an oscilloscope to determine necessary mechanical head adjustments. Outputs allow verification of correct forward and reverse, 7- or 9-channel tracking to within .0005 in., a spokesman claimed.

A 600-ft tape costs $120 and a 1,200-ft tape sells for $220 from the firm at 14 Huron Drive, Natick, Mass. 01760.

And Saves $3,500/Mo

Data Entry Cuts Claims-Processing Job

SEAL BEACH, Calif. — The Group Insurance Services Department of Rockwell International Corp.'s central payroll/-personnel operations has combined several functions into a single keying procedure using programmable workstations. As a result, the firm said, it is saving more than $3,500/mo in clerical labor while producing reports and documents more rapidly than before.

The Group Insurance Services Department processes hospital and medical claims for 47,000 employees in Rockwell International's aerospace, electronics and automotive operations, as well as for corporate staff employees, who are covered under one of two basic insurance plans. The claims-processing operation issues 1,300 to 1,500 benefit checks a day.

In the previous claims-processing operation, after incoming claims were coded and priced, a four-part worksheet was prepared, one copy of which was filed in the insured's claims file. Another copy was sent under batch control to the company's data center at Downey, Calif., for keypunching the data used to generate the "Classification of Benefits" report that goes to the insurance carrier and is the basis for reimbursement of benefits paid by the company.

Depending on the plan involved, other worksheet copies were batched and sent directly to the carrier for keypunching and generation of various statistical reports.

In addition, a copy of the worksheet was batched with payment dollars totaled and sent to three remittance advice typists in Group Insurance Services. After the four-part remittance advices were typed, an adding machine tape was then run to prove the totals to the batch controls.

The remittance advices were next forwarded for typing of the benefit checks and carbon copy check registers. The checks were signed, protected and totaled. The totals were proved to the batch totals, then audited against a copy of the worksheet and matched with the proper remittance advice.

The check and remittance advice were finally mailed to the payee. If the payee was the insured, a copy of the worksheet was enclosed. If the payee was other than the insured, the worksheet copy was mailed to the insured separately. The entire procedure was manual, including reconciling of the bank account.

"There were several obvious disadvantages in the system," Henry D. Mjellem, manager of Group Insurance Services, recalled. "The major difficulty, of course, was the labor-intensive nature of the operation from the time the worksheets left the pricers' desk with the resultant delay of issuing benefit checks.

"Aditionally, certain errors in the benefits detail area were not discovered until the keypunching and verifying functions were completed prior to running the classification of benefits report.

"We needed a system that would integrate all of the steps of processing benefit checks and capturing data for the reports with a single data entry procedure."

After a study of available hardware, Rockwell International selected the IBM 3740 data entry system for two reasons. "First, it provided us with a multiunit, stand-alone system that would not be affected by downtime which might occur in a system that used a central processor,' Mjellem said.

"Second," he continued, "since the system allows us to do on-site processing, the

(Continued on Page 32)

Merged Technologies — Part 1

Union of On-Line, COM a Winning Combination

By William McCullough
Special to Computerworld

The use of both on-line systems and computer output microfilm (COM) has increased dramatically over the past five years and there is every indication this growth will continue at an increasing rate in the forseeable future. These elements, used individually or collectively, can solve many of the problems associated with computerized information systems.

This is the first in a three-part series that looks at the integration of on-line and COM systems by William McCullough, national sales manager for U.S. Datacarp, a COM service organization.

Unfortunately, many organizations are overlooking the potential cost reduction and system enhancements possible by merging on-line and COM technologies. All too often, on-line systems are developed without any thought to the roles micrographics could play in meeting the requirements of the planned system.

The result can be a system that costs far more than necessary in software development and added computer hardware.

There are a number of reasons for this problem. Primarily it is a lack of knowledge on the part of systems designers regarding the ways in which COM may be used effectively with on-line computer systems.

This lack of knowledge can be attributed to a lack of user education by the COM industry compared with that carried on by the computer industry related to on-line technology.

There are six areas of concern with COM and on-line systems that should be examined. They are systems design and programming, data retrieval and output speed, distribution, comparative costs, real time/-current status and history/audit trails.

It is common knowledge among computer professionals that the design of on-line information retrieval systems is a lengthy and expensive undertaking. It requires a great deal of effort on the part of even the most sophisticated systems and programming staffs.

This is particularly true if the CRT is the principle or only media used to deliver whatever information is required from the total on-line information data base. If you are not certain why this is so, consider what it takes to get there.

There are three important aspects of on-line systems design and programming; loading, maintenance and back up. Loading includes data indentification, data preparation, file designation/allocation and file loading.

Maintenance includes programs for updating the data base, retrieving from the

(Continued on Page 31)

How Far Can You Stretch?

Budgets are tight everywhere — especially in the DP department. Most managers are actively seeking ways to stretch the DP dollar, and many are succeeding.

Stretching the DP dollar will be the subject of a *Computerworld* special report in September. The report will cover many aspects of saving DP dollars, from choosing the right equipment for the right job to optimizing equipment usage.

Readers are invited to contribute articles detailing their experiences wrestling with DP budgets and what they did to save money. Success stories are welcomed, but details of money-saving schemes that flopped are also welcome.

Contributions should by typed (double-spaced, please), limited to 1,200 words (four or five pages) and sent by Aug. 15 to Frank Vaughan at CW, 797 Washington St., Newton, Mass. 02160.

What can America's leading terminal supplier do for you this month?

In the small-computer business guess who's going head to head?

ing Information, Honeywell's Level 62 comes head-on. With more multiprogramming. More data communications. Data base management. Virtually unlimited growth potential.

Series 60 Level 62 lets you run lots of jobs concurrently. You can build a communications network, collect and distribute data to and from remote sites. All while running multiple batch.

And there's more. On-site system growth without hardware techniques. CP to CP communications. A range of power, performance, and peripherals not available with most comparable small systems. And our Remote Maintenance System that lets us diagnose problems, even correct software difficulties, from a remote terminal.

Honeywell

offers our Liberator. With automatic translation of your current System/3 programs. There are conversion aids for other systems, too.

Industry-oriented and financial management application systems are available for specific industries like manufacturing and distribution.

For more information, call your local Honeywell representative. Or use the coupon.

On-Line, COM Union a Winning Combination

(Continued from Page 31)

data base, preserving the integrity of the data base and purging from the data base. Backup includes media conversion, distribution and fail-soft.

It would be relatively easy to make a case against a true on-line system, particularly if time was taken to dwell upon the steps which are involved in each of these actions. Examine how much easier the job may become when micrographics, particularly COM, is combined with the on-line system.

For example, the loading task could be reduced to dealing with key fields, the computerized index to the COM data bases. The maintenance task can be similarly simplified to updating index pointers in the reduced size data base.

Programming for data retrieval from only a few fields and not all of the information in the total data base is proportionally reduced. Backup can be virtually built in, as COM-generated indexes could take over in the event of system failure.

Perhaps the most difficult task when considering COM in conjunction with an on-line system is to define the requirements of the system and determine how extensively COM might be used in the system. If the data base already exists, then the COM formatting software for creating the indexes described above is normally available from COM manufacturers and service bureaus.

The programming involved generally has to do with incorporating this software with the host programs which maintain the data base. Generally, this is neither a difficult nor lengthy task.

Retrieval and Output

In discussing retrieval and output speed relative to on-line systems, we find ourselves talking about the glamour issue of the DP field which was brought to life during the 1960s. Although it is still very much alive today, the 1970s have been dominated by first the mini and now the microcomputer.

Those familiar with CRTs and on-line information retrieval systems know it is hard to beat their speed of output. But what did you have to *input* to obtain that output? How easy was it to learn the particular retrieval language of the system?

Can you get the answers you are really looking for? Only if the data is there and is addressable.

At the cost of becoming all-encompassing, some systems become too cumbersome, and this jeopardizes their processing time advantage.

What can be done to make an on-line system more effective and maintain those features most wanted by its users? A careful and unbiased analysis of the information contained in any large on-line data base should provide statistics on key fields, activity percentages, summaries vs. details and accuracy.

Looking at Findings

In looking at the findings, several distinctions should soon become evident. First, a disproportionate share of the file receives the majority of the activity. Second and similarly, a small number of the data fields receive the majority of the action.

Considering the steps that were probably taken during the design phase of an on-line system to separate the wheat from the chaff, there still will be found data that is not really worth all the time and money it takes to store, update and retrieve it. Here is where an integration of COM-generated microfiche and the on-line system can best be introduced.

Overall speed of key information retrieval via CRT can be increased at no expense in data availability. The data entry or keying part of the retrieval can be simplified and combined with smaller files, less data to search and less to output to the CRT; a net increase in throughput should result.

All of the noncritical and detail information can be moved off-line to microfiche and, if needed, referenced on the CRT by fiche number and grid coordinates.

It cannot be denied that there are certain functions which rightfully belong to on-line systems. What I am attempting to emphasize is a method to enhance those functions and provide an even better total information retrieval system.

Fiche Aid

SKOKIE, Ill. — Business Efficiency Aids, Inc. is offering the Model PI-100 Magnetic Micro/Finder Tray of high-impact plastic for storage and retrieval of microfiche.

The PL-100 includes 100 Magne Dex separator cards. Magnetized siderails provide a power supply to separate fiche for retrieval.

The unit, with four vinyl index guides and a vinyl dust cover, sells for $24.95 from 8114 N. Lawndale Ave., Skokie, Ill. 60076.

Proceedings Published

PHOENIX — Honeywell Informations Systems, Inc. here has published the proceedings from its Computer Security and Privacy Symposium held in Scottsdale, Ariz., last April.

The proceedings cost $25 from Jerome Lobel, computer security manager, Mail Station K-99, HIS, P.O. Box 6000, Phoenix, Ariz. 85005.

YOU CHOOSE THE WINNER

PROCESSOR	6/16	NOVA 3/4	PDP-11/04
Data Type Lengths (bits)	4,8,16,	16	1,8,16
Instruction Word Length (bits)	16,32	16	16,32,48
General-Purpose Registers	16	4	8
Hardware Index Registers	15	2	8
Maximum Memory Available (KB)	64	64	56
Directly Addressable Memory(KB)	64	2	56
Automatic Interrupt Vectoring	Standard	N/A	Standard
Parity	Optional	Optional	N/A
Cycle Time (nanoseconds)	600	800	725

PRICE	6/16	NOVA 3/4	PDP-11/04
8KB Processor	$2200	$2600	N/A
16KB Processor	$2800	$3200	$3795
32KB Processor	$4000	$4400	$4995
Multipy/Divide Hardware	$ 950	$1400	$1820

Interdata's 6/16 wins the battle of the specs.

Not only do we cost less than the Nova 3/4 and the PDP-11/04, we have more features. Just compare: 16 general purpose registers on the 6/16 to simplify programming and reduce fetches . . . only 4 in the Nova and 8 in the 11/04; 15 hardware index registers on the 6/16 against 2 for the Nova and 8 for the 11/04; 64 KB of directly addressable memory instead of just 2 KB for the Nova 3/4 and 56 KB for the PDP11/04.

What's more; all these hardware features enhance the nimble 6/16's performance. Its cycle time is only 600 nanoseconds, compared to 800 for the Nova and 725 for the 11/04.

Interdata's comprehensive software drives this powerful hardware full out. You get the field-proven OS/16 MT2, a real-time, multi-tasking operating system providing instantaneous response to events, while allowing the user to minimize memory by storing non-critical functions on disks. And the 6/16 can be programmed in your choice of FORTRAN, BASIC or MACRO CAL.

All this and save money too, as much as one-third less than a PDP-11/04 and substantially less on a Nova 3/4 . . . with OEM discounts saving even more.

Get the whole story. Just fill in the coupon or call (201) 229-4040.

Send me 1977 specs on your Model 6/16

Data Entry Integrates User's Claims-Processing Tasks

(Continued from Page 29)

documents do not have to leave the department. We can therefore have immediate reaction to error conditions, rather than having to wait for error reports to be returned from the data processing center."

Rockwell International's data entry system consists of one IBM 3741 Model 4 and four 3741 Model 3 programmable workstations, each of which has an 8K-byte core memory. The Model 3 units are equipped with dual diskette drives and two of them have printers attached, a 3717 line printer and a 3715 bidirectional character printer.

All of the workstations can be used for keying and, in addition, the Model 4 has the capability to transmit data to one of the six IBM 370/168s at the central computer center.

The previous multiple-typing tasks are now accomplished in one data entry procedure performed by three operators. Under program control, as the coded information from the worksheet is entered it is automatically run against tables stored in the program, with erroneous data rejected.

The program also adds dollar amounts and audits the check totals to worksheet totals during the input procedure; in addition, it displays the grand total of checks for balancing against predetermined batch totals.

The information is recorded on diskettes which are then placed in one of the workstations attached to a printer. The benefit checks are printed automatically with the remittance advice, which is now a stub on the check. The separate remittance advices are no longer used.

The check registers are also printed automatically on the printer-equipped workstation. At the same time, an output diskette is generated for transmission of classification of benefits and check reconciliation data to a central computer at Downey.

The classification of benefits report is now printed directly from the transmitted data, eliminating the previous keypunching and verifying functions.

"Although only three operators are required to handle all of the work in the present system, we trained all six of the typists who were doing the work before," Mjellem said. "Three of the employees filled other openings in the department and now provide backup during vacations or in case of illness of the three full-time operators."

Biggest Advantage

"The greatest advantage has been in saving over $3,500 a month by reducing the number of people required to do the typing and data input from seven (including the full time of one keypunch operator) down to three, but we are realizing other significant benefits as well," according to Clarence P. Dietterich, manager of systems development for the central payroll/personnel operations.

"For example," he explained, "previously there was always a backlog of one or two days' work for the check and remittance advice typists, even though they frequently worked as much as four hours a day overtime. Now they can keep up with the large volume of worksheets generated by our 26 pricers, even during the big work crunch that typically occurs during January and February.

"Overtime is now practically nonexistent and the workload is up-to-date at the close of each day."

Greater accuracy is another area in which the data entry system has been of great advantage, Dietterich said. Since all of the edits and audits are built into the system, corrections are now made at the point of entry.

This in turn has speeded up the job of balancing and printing the monthly "Classification of Benefits" report. In the past, this report usually could not be completed until after the middle of the following month; it is now mailed no later than the ninth day of the month.

The information transmitted from the diskettes is also used at the data center to create a magnetic tape which is now sent to the bank. This enables the bank to reconcile the account on its own computer, thereby eliminating the need for manual reconciling by Group Insurance Services personnel.

"The system has also made it possible for us to achieve additional savings by eliminating the four-part remittance advice forms and the carbon copy check register. Moreover, we no longer incur the expense of buying and storing data cards. We require no more than about 150 diskettes for recording all data, and these are continually recycled," Dietterich said.

"Since we put the system into operation, our complete claims-processing cost of about $3 a claim has been maintained in spite of increasing labor costs — a very low figure in comparison with average claims-processing costs throughout the country," he concluded.

Emerson Designs UPS For Big Applications

SANTA ANA, Calif. — Emerson Electric Co. has introduced a 415 Hz uninterruptible power supply (UPS) system designed to allow users to enhance present UPS systems:

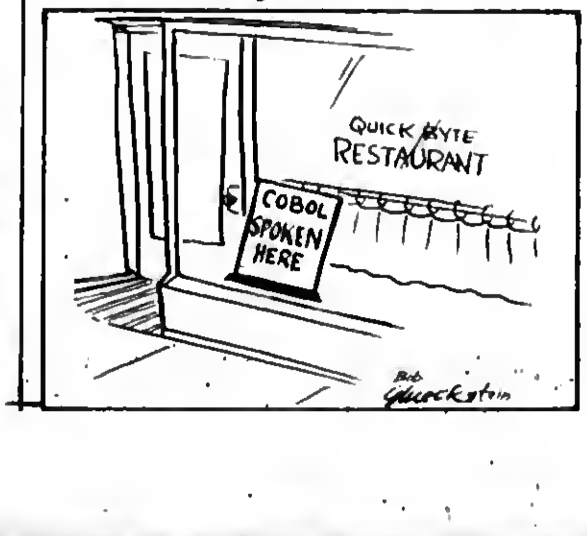
The AP91 is compatible with existing Emerson 60 Hz products and can utilize a common battery to save space and equipment costs, according to a spokesman.

Standard features include alarms, adjustable battery charging rate, dc ground fault protection, dc under- and overvoltage protection, manual output voltage control, input current limiting and input line protection.

Options for the AP91 include ac ground protection, alarms and indicators, line dip compensation, meters, remote meter and alarm panels, shipping breaks, switchgear and a 50V proportion signal.

An AP91 system costs approximately $35,000, depending upon configuration. The battery is an additional $10,000 to $15,000, depending upon capacity.

The battery must be purchased separately, the spokesman noted from the firm at 3300 S. Standard St., Santa Ana, Calif. 92702.



We put more into it, so you can get more out of it.

The Elite 4000A programmable terminal system

From Datamedia

Features like eight-level vi[illegible] interrupts, direct memory access, linking, expandable memory, and built-in modems. That help you get your programs where you want them, how you want them, and when you want them.

Which means smarter use of memory. And more use of memory. And more from your memory and terminal dollar. From Datamedia Corporation. And you — the really smart terminal.

Too much power?
Ask about The Datamedia Elite 3000A — lower cost ... and still user programmable
Ideal for real-time emulation

Mini Bits

Maker of Array Processors Establishes Group for Users

PORTLAND, Ore. — Floating Point Systems, Inc. has formed a users group open to users of its array processors and "those making significant contributions to the technology."

The group will sponsor meetings and papers about the technology, the firm said. At the first meeting, 47 users heard papers on subjects ranging from speech processing to physical chemistry, the company noted.

Users wanting more information should contact Lynn McDaniel, the user group coordinator, at P.O. Box 23489, Portland, Ore. 97223.

Mailing Envelope Designed To Protect Floppy Disks

SMYRNA, Ga. — A mailing envelope for floppy disks said to save users 44- to 50 cents per disk in first class postage is available from Curtis 1000 here.

The envelopes accommodate one to five floppies in filing sleeves and are said to provide a lint- and dust-free environment. They are reportedly resistant to tearing and puncturing forces and protect the disks against chemicals and wetness.

Prices for the envelopes vary from about 14 cents each in very large quantities to 27 cents each in quantities of 100. The company is located at 1000 Curtis Drive, Smyrna, Ga. 30080.

Swap Proceedings Published

LOWELL, Mass. — The proceedings of the 1976 Society for Wang Applications and Programs (Swap) users society symposium is available. The 725-page publications contains over 50 papers presented in seven sessions.

A copy of the proceedings can be obtained for $17.50 from Wang Laboratories, Inc., Swap Users Society, One Industrial Ave., Lowell, Mass. 01851.

HP Has Mini-Based GC/MS

PALO ALTO. Calif. — The Hewlett-Packard Co. 5990 series gas chromatograph/mass spectrometer (GC/MS) incorporates an HP 21MX E-Series system with a dual-disk drive, according to the vendor.

The GC/MS is fully integrated into a desklike cabinet that sits atop the two-bay data system, HP said. Because the operating system provides compilers for Fortran II and IV, Algol and Assembly language as well as a Basic interpreter, users can develop their own programs for the unit, the firm noted.

A basic system excluding CRT terminal costs $70,000, HP said from 1501 Page Mill Road, Palo Alto, Calif. 94304.

The Turnkey — Part 2

Users Must Determine Needs in Advance

By Vincent Deschamps
Special to Computerworld

It is singularly important for users to establish the criteria that are to be used as the selection and contract standards for a turnkey system. Users must determine their requirements in both hardware and software.

One of the first areas to be tackled in the hardware arena is determining what is needed from input devices. Find out the volume of transactions to be processed through the system, because this will help you establish the amount of power a mini must provide to perform your applications. The number of input devices will be determined by your workload.

Consider peak work periods for determining volumes of transactions. Peak work periods are indicative of maximum volume; off-peak levels will not give you the real parameters of the requirement you have for input devices. Seasonal effects must also be considered if volumes are affected.

Determine how many people need or should be able to gain access to the computer at the same time.

Availability of the computer should be based on a need for instant information. Analyze how many people need instant information at the same time.

This is the second article in a three-part series dealing with how to successfully install a turnkey minicomputer. Next week's installment will include recommendations for implementation procedures and scheduling.

Establish whether input devices can be shared by personnel without inconvenience. Key executives in one or more departments may need immediate access, but that does not necessarily mean each one requires his own terminal.

Determine whether the device should offer video or print capabilities or whether the user needs both.

Data Base Size

To determine the size of the data base, list every type of data to be stored, such as number of customers and number of inventory items. Then determine the approximate number of characters needed per type and amount of data.

Finally, analyze this data base according to peak periods. Figure the maximum size these files will be during the year. To figure out hard-copy output requirements, determine how much data needs to be printed daily, weekly, monthly and quarterly. Massive volumes of computer printouts are expensive and not necessarily meaningful and useful in a real-time computer system.

Next, determine the time frame you're willing to live with from the time data is prepared to the time it is to be printed and delivered. It is important to establish how many printed copies are required on the basis of utilization — not desire. Your result will determine the type and speed of the printers necessary.

Accessibility of the data base is another criterion users should consider.

First, establish the times data is required and make your decision on whether the requirement is immediate, once a day, once a week, once a month or once a year.

Next, establish the volume in each of the categories.

Determine the format or media for each type of data to be presented — soft copy

Desktop CPU Wins Over User By Easing Market Research Job

By Esther Surden
Of the CW Staff

BIRMINGHAM, Ala. — "From talking to my colleagues around the country, I've heard that even if you have access to a big computer, the market research department always comes after the janitor in getting use of it."

With these words Thomas M. Adams, manager of public affairs for the *Birmingham News* here, told why he likes using his small desktop minicomputer system.

Adams didn't always enjoy using the small system; in fact, he resisted the switch from an Olivetti calculator to something more complicated.

"I used the Olivetti for market research data, but I also had to do rate schedules and amortization schedules with it. With the way interest is going up, we would overload the Olivetti," he explained.

"We finally got the Hewlett-Packard desktop system after the general manager wanted me to run something he was working on and the calculator couldn't handle it," he recalled.

The department looked at systems from Wang and Rockwell International before choosing the HP 9815. "I didn't want to learn how to program it, so I said 'You get me someone to program it, and I'll take it,' " Adams said.

The newspaper got a programmer right out of college to program the system, "but he just couldn't handle it. He'd learned Fortran and Cobol."

Next Adams looked around for a school that could teach him how to handle the system — but there wasn't one. HP didn't have a training program, he said, and the colleges had bigger things on their minds.

Finally, he found a freelance programmer

(Continued on Page 34)

AJ Extends Options for Novices

SAN JOSE, Calif. — Joining the other terminal makers that now offer small business systems to first-time users, Anderson-Jacobson, Inc. (AJ) has introduced a system it said features multiprogramming capability and can accommodate up to eight terminals interactively.

The AJ 1500, built around an updated version of the Eldorado Electrodata Corp. CPU, is diskette-based, unlike the older system. It was designed for certified public accountants and accounting practices.

Accounting Software

The accounting software, designated CPA III, includes programs for general ledger, budget accounting, non check-writing payroll and loan amortization. Optional packages such as accounts receivable, accounts payable and payroll with check writing are also available.

A text editor for word processing can also be added to the system, AJ noted.

Available through a network of dealers, the system can be compared to the Burroughs B80 and IBM System 34 for most of its functions, an AJ spokesman said. Service will be provided through AJ's service centers in 40 cities, third-party service or local dealers depending on the location, he added.

A basic AJ 1500 includes 32K bytes of core memory, two 630K double-density diskette drives and a 45 char./sec daisywheel I/O console printer.

Optionally, the AJ 1500 system can be expanded to include 64K bytes of core memory, four diskette drives and four 10M-byte cartridge disk drives. Users can also select a 60- or 120 char./sec dot matrix printer, a CRT or a 300 line/min printer.

The basic system costs $19,990 including the CPA III software, the company said from its Computer Systems Division, 521 Charcot Ave., San Jose, Calif. 95131.

University Slates Short Mini Course

MILWAUKEE — A short course on minicomputer and microcomputer systems will be held at the University of Wisconsin Extension here Sept. 26 - 30.

The course is designed for engineers, scientists, system designers, system programmers and applications specialists who want to expand their knowledge of computer hardware and software, according to a spokesman.

It is intended to teach computer programming fundamentals on which "the more advanced topical coverage of the later portions of the course will be based," he noted.

The course costs $375. Information is available from John T. Snedcker, Department of Engineering, University of Wisconsin Extension, 929 N. Sixth St., Milwaukee, Wis. 53203.

Users Must Analyze Needs in Advance

(Continued from Page ''

(CRTs) or hard copy (printed report). Make this decision based on whether a screen response is adequate or whether a printed document is necessary, under what circumstances and how often.

Software Considerations

In the software area, find out if the vendor provides proven applications program packages. These are always less troublesome and less expensive than customized packages if they fit your application.

If they don't fit, they will be more troublesome and more expensive in the long run.

Make a list of software capabilities you require of the vendor. Make sure it already has or can deliver efficient software packages for your specific applications at a reasonable cost.

This is expecially important because, to the unsuspecting, software can cost more than hardware, especially if it involves custom development.

Favor the vendor who has experience in your industry. If many companies within one industry have different requirements, you can believe that most companies in different industries have multitudinous varieties of requirements.

Finally, make sure the vendor is contractually agreeing to take "turnkey" responsihility. "Turnkey" means making sure all the hardware and software is delivered, installed, operational, debugged and documented. In simple words, you plug it in, switch the power on and your system is ready to go.

Since the purchase, lease or rental of a minicomputer system represents a significant investment, all of the elements in the contract should be delineated:

- All responsibilities of the vendor and user should he clearly defined.
- There should be a finite plan which details the development of the system from beginning through installation as an integral part of the contract.
- The contract should also stipulate that complete documentation will be provided hy the vendor.

Deschamps is president of Turnkey Sales & Leasing, Inc. in New York City.

Desktop Mini Wins Over User

(Continued from Page 33)

who knew the system. "He was going to do all the programming, but when he charged $1,000 for one application" Adams had second thoughts.

"I took home one of the applications and a book explaining the system and worked it out on paper. I became so confident that it would work that when I tried it it did work," he said.

That began the public affairs manager's love affair with the system. Since then, the department has been using it for a variety of applications.

"When the marketing research operation was first initiated in 1969, its primary aim was to provide reader profiles to the editorial staff," he explained. "But, after accumulating all of the data, we realized what a tremendous help the information would be to area businesses.

"Now, after seven years of surveys, we find that many businesses have come to rely on us — anxiously calling weeks before the due date to check our status," Adams said.

The procedure for gathering an audience profile may take as long as six months. Researchers from an outside consulting firm visit an average of 125 homes per month in the Birmingham area — 1,500 per year — with a list of questions to ask each member of the household.

Through the years, this list has been expanded and refined until it presently includes detailed questions about reading, shopping and living habits.

Survey data is entered into a large outside time-sharing computer located in Dallas, Texas, for batch processing. The results are returned to Adams through a terminal located at the newspaper.

"Time-sharing is expensive, so we use it as little as possible. That means we try to minimize the work done by the large computer to only the large statistical correlation problems. The smaller computations, finishing touches and final printing are all accomplished on our desktop system," Adams said.

"The survey results, as they return from the time-sharing system, are entered into the 9815. The small computer then further processes the information into a readable format complete with line and bar graphs.

"By using the system with an HP printer, we can produce final printed copies without incurring the added expense of hiring a layout and paste-up person."

The editorial department of the *Birmingham News* uses the system to plan story features to meet reader interest. The advertising department uses the report to sell advertising, test ad campaign effectiveness and adjust rates. Area business firms that subscribe to the service use the information to develop marketing strategy.

One area firm, planning to open two more stores, consulted the report to choose the best site locations. The firm was provided with a list of recommended and alternate locations.

Adams has also been contacted by a number of national firms interested in moving into the Birmingham area that want a profile of the average employee and customer.

Another job of the computer is computing and adjusting advertising rates and printing new rate cards. This operation, which used to take a day and a half on an adding machine and typewriter now takes a minute and a half on the small system.

The 50 Million Dollar Award...
ICP's highest volume recognition...
awarded exclusively to
Cincom's TOTAL DBMS.

The Software Honor Roll...
Datapro'e certification of quality...
user surveys mede TOTAL the
only DBMS 3-time recipient.

Quantity. Quality.
More evidence of TOTAL acceptance.

So often in lifa, one must choose between quentity and quality. User success with the *TOTAL Data Base Management System* proves that *both* benefits accrue to the organization who selects TOTAL es the foundation for its information system requirements.

Nearly *2000 installations worldwide* ... from efficient minis to the largest maxis ... have demonstrated that the capabilities, aase of use, and power of the TOTAL DBMS can be epplied successfully to neerly any operating environment. Inputs, feedback, and suggestions from this larga and diverse user base insure an *exceptionally stable product* ... so important in the world of data besa processing ... and a continuous *emphasis on product enhancaments.* This is what makes quantity and volume es represantad by the ICP 50 Million Dollar Award meaningful.

With nearly *four times* the number of user reports submittad than the next leading DBMS product, TOTAL received high marks for *overall satisfection* ... recording e rating of 3.5 on a scala of 4.0 ... in the Datapro Research survey. Other major factors in this independent survey include throughput/efficiency, eese of installation/usa, documentetion, end vendor training/technical support. Such user racognition brought TOTAL its *third Honor Roll award* ... *unique* among DBMS. Quelity and consistency are what makes this tribute meeningful.

If you are planning your organization's move into data basa, and, if quantity accaptance couplad with consistant quality are most important to you, why not contact your local Cincom Systams rapresentativa today?

Firm Sold on Open-Minded Programming To Solve Sales Problems Using Mini

GRAND RAPIDS, Mich. — Because "we didn't want to get locked into a type of thinking in which we were going to serve the computer instead of the computer serving us," Bob Jones Corp. had its small business system programmed by a company that had an "open mind," according to Bob Tourek, president of the company.

The firm went the small business system route after using a service bureau for several years and even doing some in-house keypunching. It chose an IBM System 32 after looking at several alternatives. It "was the only one that could fulfill a secretarial function," Tourek stated.

Then the firm searched for a programming company to fill its needs. Several were suggested by IBM and after interviewing representatives from all of them, Bob Jones chose Computer Directions, Inc. The firm was just starting out, Tourek explained, and it was flexible enough to see the computer as a tool for solving sales problems.

The system, which captures and maintains data on sales histories to produce a number of reports, prints the reports in a format that is easily understood by both the salespeople and the customers.

Other reports compare year-to-date sales figures for the current year and the previous year as well as the sales figures for the same three months of the previous year. This allows the company to evaluate sales for the current year in relationship to the same period last year and plan sales tactics, he explained.

Promotion reports are used to help account for large fluctuations in sales and to evaluate the success of specific types of promotions.

The system also provides trend reports comparing average weekly movement for the previous 52 weeks with similar figures for the prior 52 weeks. These reports, detailing the movement by item for specified customers, identify trends, distribution holes and new distributions.

The system is also being used to maintain data on brokerages due. Sales volumes and brokerage receipts can be reported by customer type (grocery, nonfoods and food service) or by item type (grocery, frozen, dairy, meat and nonfoods).

Reports are produced on demand, thus eliminating the unnecessary production of paper volume. The parameters for the reports are entered by the operator so the reports can be limited to certain time periods, certain principals or certain items, Tourek said.

The data for the system is obtained from orders and invoices. Customer orders are entered on the computer, and orders are printed for mailing to the principals.

Daily and weekly reports are printed to provide order volume data and to compare this week's orders to those for the corresponding week from last year.

When invoices are received, only the exceptions to the orders need be entered. At that point, the computer captures the sales data and retains it for two years, Touret noted.

The system, which was installed in November 1975, is an IBM 32 with a 16K memory, a 9.1M-byte disk and a 100 line/min printer.

The software was developed by Computer Directions, Inc. and was designed for interactive processing, Marilyn Doig of Computer Directions explained.

Basic/Four Printer Fits Model 400 Unit

IRVINE, Calif. — Basic/Four Corp. is offering a 150 line/min printer for its Model 400.

The Model 3152 line printer features a standard 96-char. upper/-lower case capability and double-height characters. Underlining can be produced for report titles on forms up to 16 in. wide, the firm said.

The printer costs $7,900 Basic/-Four said from P.O. Box C19550, Irvine, Calif. 92713.

4 to 5 times more productivity!

We're offering the most versatile 1200 Baud hardcopy terminal available. Our new Matrix Terminal prints 200 cps, has a 100% duty cycle 7 x 9 dot matrix head, that prints upper and lower case. We are microprocessor-controlled to provide incremental and "automatic" bidirectional printing, unique horizontal and vertical tabbing and extensive margin controls. We also offer program control multiple fonts, control code functions and versatile forms handling. We communicate in ASCII code, and are compatible with Bell 103A, 113A, 202 and 212 modems and other 110 to 1800 Baud asynchronous modems using the RS 232C interface, and we print an original and five or more legible copies of all 94 ASCII characters. A nice plus: our table-top terminal has the features and friendliness of an office typewriter. The rest comes from a demonstration! Call your Diablo representative or write Diablo Systems, Inc., 545 Oakmead Parkway, Sunnyvale, Ca. 94086, or Diablo Systems, S.A., Avenue de Fre, 263, 1180 Brussels, Belgium or Mitsui & Co., Ltd., 2-1 Ohtemachi 1-Chome, Chiyoda-ku, Tokyo.

Bicaroe System 2 Runs IBM 32 Industry Applications

CUPERTINO, Calif. — A small business system that reportedly runs IBM System 32 Industry Applications Programs (IAP) and costs between $15,200 and $24,200 is being offered by Bicaroe, Inc. through dealers.

The System 2 uses up to four double-sided, double-density floppy disk drives, a built-in CRT with 1,024 characters and either a daisy wheel or matrix printer in one desk unit.

Maximum storage capacity with the diskettes is 4.8M bytes, the firm said.

Two system control programs (SCP) are available for use with the IAPS and for programming Application Control Language (ACL), which IBM developed for use on its 3741 data entry system. An ACP occupies 16K of memory.

The Bicaroe System 2 will also run the IBM System 32 RPG II and utilities, which may be licensed from IBM, Bicaroe added.

The ACL supports a maximum of 32K bytes of user memory and provides arithmetic functions; CRT, printer and diskette I/O; keyboard entries; table searching; check digit verification and other functions, Bicaroe stated.

With ACL, the memory is segmented. An ACL translator requiring 8K bytes is also provided. Three passes of the program are required to assemble a complete program, the firm said.

The firm provides free utilities to copy diskettes, sort and merge diskettes or to use as a diskette directory and a listing of table contents.

Six Basic Packages

Six basic accounting packages are currently available free from Bicaroe: order entry, accounts receivable, general ledger, payroll, accounts payable and inventory management, according to the firm.

Bicaroe is interested in hearing from System 32 users who have developed their own programs, as it wants to build a library of programs for its users, a spokesman added.

The System 2's processor cycle time is 125 nsec. The CPU is comprised of discrete components on two 8-in. by 10-in. circuit boards. Memory cycle time is 600 nsec per 1-byte access, the firm said.

The minimum configuration machine has 24K bytes, one diskette drive, a CRT, a daisy wheel printer with a speed of 45 char./sec and a keyboard. It costs $15,200, according to the firm.

The maximum configuration consists of 64K bytes, four diskette drives, a 200 char./sec matrix printer and communications features. It costs $24,200, Bicaroe indicated.

The optional data communications feature provides bisynchronous capability up to 9,600 bit/sec.

Service is available through TRW. First shipments are scheduled to begin this month. Bicaroe is at 20730 Valley Green Drive, Cupertino, Calif. 95014.

Turnkey Handles Manufacturing, Accounting Control Situations

SANTA MONICA, Calif. — Disc/310 Corp. has an on-line minicomputer-based turnkey system for manufacturing and accounting control applications.

Based on Data General Corp. Nova or Eclipse CPUs, the system is said to handle several costing methods including standard lot costing and actual costing and to include provisions for multilocation inventories.

Other features include multilevel indented bill of materials explosions; where-used implosions; work-in-process control for either a job shop or production line, and serial number control, the company stated.

The system also handles invoicing from work-in-process by job number and serial number, time-phased material requirements planning and labor capacity planning, a spokesman said. Traditional applications such as order entry, accounts receivable, payroll, sales analysis and purchase orders are also accommodated by the turnkey unit.

A typical system with 64K bytes of memory, a 10M-byte disk drive, two CRTs and a 300 line/min printer costs $70,000 including software or leases for about $1,400 monthly under a third-party five- to seven-year agreement. "Each software system is customized to fit specific end-user requirements," a spokesman added. The company is located at 1840 Lincoln Blvd., Santa Monica, Calif. 90404.

Controller Expands Dataflux Disk Line

SUNNYVALE, Calif. — Dataflux Corp. has added another controller to its line of fixed-head disk storage systems.

Designated the DC-111, it enables Digital Equipment Corp. PDP-11 users to operate in rugged environments, the firm claimed.

The controller is available in configurations transparent either to DEC RK05, RF11 or RC11 controllers.

As many as eight Dataflux Model 980 fixed-head disk drives may be daisy-chained and run through a single DC-111 controller, to provide up to 16M bytes of storage, the firm said.

"The DC-111 makes a fixed-head disk 'look' like a moving-head disk to the PDP-11 minicomputer," a spokesman claimed. This feature allows the user to bootstrap, or self-load directly from the disk, he added.

The controller is said to be transparent to RSX-11 or RS-64 operating systems and fully compatible with the DEC Unibus.

Packaged on three DEC-type "quad" boards, the DC-111 is mounted as a four-slot system unit. This unit can be installed as a subchassis in the CPU, or else it can be ordered with a separate chassis of its own.

The Model 980/DC-111 system uses the Dataflux Disc Cell, an interchangeable fixed-head disk cartridge containing spindle, Winchester-type media and read/write head assemblies.

This cartridge, packaged and sealed to work in severe environments, is available in storage capacities ranging from .5M to 4M bytes.

The DC-111 controller costs under $4,000. As a complete outfit, the Model 980/DC-111 system is priced at less than $10,000, Dataflux said from 1195 E. Arques Ave., Sunnyvale, Calif. 94086.

ON ANY TRACK WE'RE HARD TO BEAT

When you talk about leasing an IBM/370, you are on a fast track. Each leasing company claims it has the best program for you. But does it? With over $200 Million of IBM/370 equipment on lease in the U.S. and overseas, Alanthus' customers are saving more than $17 Million annually. That's a real winner!

Our leases are unmatched in flexibility. We can offer you a short operating lease, a long term financial lease, or even a revolving lease. Working with you, we can custom tailor the lease program to suit your needs. You win again!

But here's one to get you first past the post. Alanthus is offering to installed 370/158 and 370/168 users, operating leases of 1, 2, 3, and 4 year terms.

Our lease documentation is easily read and understood. It consists of only four pages plus an equipment schedule. Another winner!

Call the people from Alanthus. We have the lease program that's best for you. We're winners on any track.

But Present Terminals Will Stay

X.25 Standard Holds Promise for Potential Users

By Mark S. Radwin
Special to Computerworld

A lot has been written in the last two years chronicling the transition of the X.25 protocol from a proposal developed and promoted by a small group of individuals to the CCITT international standard method of access to packet transmission networks. This article will concentrate on some of the practical implications of its use rather than describing the protocol itself.

Although X.25, has been mandated worldwide as a device-independent packet mode interface for public packet networks in operation or under development, and although its usefulness is abundantly clear, it will not eliminate the support of device-dependent interfaces for the hundreds of thousands of existing Teletype-compatible, IBM 2741-compatible and remote batch terminal devices.

Clearly a public packet network cannot obsolete the huge investments in installed-base nonintelligent terminals. Even though sales of intelligent terminals are now increasing, it will be many years before they outnumber nonintelligent models.

Easy Interconnection

Although X.25 protocol terminals will not supplant existing terminals and protocols overnight, they embody a number of compelling advantages for potential users. The first striking advantage is their high degree of interconnectability to computers and application programs.

Currently most of the higher speed synchronous terminals are connected in rigid star networks emanating from single host computers. Before IBM's Systems Network Architecture (SNA) and comparable subsequent offerings from other mainframe manufacturers, an individual terminal was typically dedicated to a single application and its corresponding telecommunications access method on a single host CPU. SNA, as originally announced in 1974, added another minor dimension, permitting one terminal to work with multiple application programs on a single CPU.

Recently a further extension was announced that will allow for the interconnection of several properly configured IBM 370 CPUs. A terminal attached to the IBM 3705 front end of one CPU can connect to an application program in another through the leased lines that interconnect the 3705s of the networked machines.

Digital Equipment Corp. has gone one step further, with Decnet providing this form of network access to several DEC families of CPUs.

The packet networks to which X.25 terminals will attach provide the user with three additional dimensions of interconnectability. Interconnectability is offered to a very large number of host computers from a variety of manufacturers, a growing number of commercial and academic vendors of computing services not available in a closed corporate network, no matter how large, and an increasing number of host computers and terminals located in many foreign countries beyond the economic reach of closed networks and made available through the international interconnections of packet networks.

As all operational packet networks and those under development have announced intentions to support the X.25 protocol, X.25 has also become the most probable network lingua franca. Its suitability for this role is being advocated by the principals who championed its original adoption.

Error-Free Transmission

One outstanding advantage of packet networks is built-in error-free data transmission. Through sophisticated error detection and retransmission techniques, the network offers extremely low probabilities of undetected errors in data transmitted internally. Extending the network's internal protocol right up to the host computer interface, as Tymnet does in both its asynchronous and binary synchronous Tymcoms, completely protects this transmission link from errors.

The Achilles heel that remains in operating networks is the unprotected path between the network node accessed by the user's non-packet mode terminal and the terminal itself. Currently, most error detection is achieved by combining full-duplex network echoplexing of user inputs with character parity generation and checking by the terminal.

The X.25 protocol for packet mode terminals (or host computers) protects this final link with cyclical redundancy checks (CRC) for errors and subsequent retransmission. Thus the protocol implements total end-to-end error detection and correction by retransmission.

Because a packet network can perform character set translations, totally dissimilar and hardware-incompatible terminal types can communicate with each other.

There are a number of economic advantages to using X.25 to connect intelligent packet mode terminals to a network. The principal cost advantages appear to derive from cluster configurations, in which a moderate number of terminals are, on average, simultaneously connected through the network to various processors or application programs.

It should be noted that the X.25 protocol is, in effect, the equivalent of a packet-interleaved time-division multiplexer (TDM), allowing — in theory at least — up to 4,096 simultaneous logical connections. Although adequate pricing information is not yet available, the total cost of an X.25 terminal cluster controller is expected to compare favorably with that of a pair of intelligent TDMs and the required asynchronous network ports.

Heavily used X.25 interfaces can clearly save dollars by avoiding the telephone company's Single Message Rate Timing (SMRT) charges. In states where SMRT charges have already been levied, such as California, each locally dialed telephone call placed by a business line begins accruing a one-cent-per-minute charge after the inital few-minutes period. This new charge of 60 cents per terminal hour represents a significant monthly expense for an intensive user of network services.

With X.25, access to the packet transmission network is accomplished through a single four-wire leased line and synchronous modems. To evaluate the relative economics, a potential user should compare the cost of the leased access line and modems plus the network access charges for an X.25 port with charges for an equivalent monthly volume of non-packet mode network access and SMRT costs.

Accurate calculations, of course, cannot be made until prices for the X.25 cluster controllers and their associated terminals become available along with the tariffs for X.25 access to the packet networks. However, reasonable projections can be made, and the crossover point at which an X.25 cluster controller becomes economically advantageous appears to lie between five and 10 terminals connected on average throughout the full business day.

Mark S. Radwin is manager of operations for the Tymnet, Inc. communications network.

With 400 Terminals

Mo-Pac Tracks Railroad Freight Cars

ST. LOUIS — Practically everyone, at one time or another, has enjoyed running a toy railroad.

But consider a full-sized one with 1,100 locomotives and 96,000 freight cars in motion along 11,000 miles of track in 12 states or being loaded and unloaded at 100,000 customer sidings. Running it requires receiving 135,000 messages and sending 160,000 messages daily.

To perform the tasks which these figures only begin to describe, Missouri Pacific Railroad (Mo-Pac), one of the nation's largest railroads, has developed a computer information, communications and control system. The related software is larger in scope and more complex than that used by the nation's largest airlines or by the Apollo space program, according to Mo-Pac officials.

Called the Transportation Control System (TCS), the Mo-Pac system employs over 400 on-line computer terminals — including 91 recently installed Memorex display stations. The network also includes minicomputers throughout a vast territory that, like the railroad itself, runs from Chicago to Laredo and El Paso, Texas, from St. Louis to Pueblo, Colo., and from Kansas City to New Orleans.

The network's hub is located at the 125-year-old line's headquarters here where many of the corporate managers, accountants, bookkeepers, clerks, schedulers and customer service managers store and retrieve the information they need to run the railroad efficiently. The 91 Memorex 1377 display stations are used throughout the headquarters building.

All-Day Work

"Our new 1377s have been readily accepted by the people who use them," John Brennan, senior project manager at Missouri Pacific said. "The improved clarity and nonglare screen are easier to work with especially when sitting at the CRT the entire day."

A replacement for the IBM 3277-2 station, the 1377 CRT is designed for entering and displaying data on-line to an IBM 360, 370, 3 or 3790 communications system. In Mo-Pac's case, the 1377s are used with a 370/168.

One of its features is the screen's bottom line, which is devoted to status advise. A digital indicator here displays both the column and line location of the cursor symbol. This feature is important when an operator is required to position data on an unformatted screen, Brennan noted. The status line is also used to alert operators of the terminal's condition, e.g., System Available, Insert Mode, etc.

As cars enter the railroads system, whether from customers or from other railroads, clerks send the computer designation and handling instructions for each car. The CPU then indicates where the car is to go next. Cars are put together and the 370 is informed of their makeup. The mainframe then sends lists of trains ahead to interested parties.

Generally, only cars handled differently from the way the 370 has instructed need to be reported back. Train departures, arrivals, interchanges of equipment and other railroad events are sent to the system continuously.

Based on the continuous reporting of a large set of railroad events, it is the CPU's responsibility to keep track of every car and every train on the railroad, Brennan said. The host is also required to keep an inventory of every classification yard and many industrial areas. This information is immediately available for inquiry by anyone in the system, he noted.

Special on-line reports are available to the people who need accurate information fast. The information is also used in various accounting and management analysis reports run after the fact by an off-line processor, he added.

In addition to the display stations tied to the 370/168, about 300 other CPU links are maintained along the railroad. These include a mix of Incoterm and IBM terminals and 20 Digital Equipment Corp. minicomputers, Brennan said.

Operations control officer at Missouri Pacific Railroad's transportation center monitors locomotives, using Memorex 1377 display stations.

The terminals operate on large multidrop networks, he stated. A variety of other communications systems are in use, including full-period dedicated private lines, a company-owned microwave system and Western Union facilities. The entire system operates round-the-clock.

One place where Memorex terminals are used is in the railroad's operations control center. Three are dedicated to the department known as the operations control transportation center, which has responsibility for management of locomotives.

Ten of the display stations are also used to perform a similar task with regard to freight cars by Mo-Pac's central car control. This aspect of the still developing TCS is aimed at monitoring and regulating the process of

Data General. A la carte.

Now, you can buy our DASHER™ terminals, even if you don't own a Data General computer system. Select our fast impact printer and our user-oriented video display. Both are interface-compatible with any standard computer system.

Choose either 60 or 30 cps versions of the DASHER printer, which has a standard typewriter keyboard, u/l case, 132 columns.

DASHER display features a 1920 character screen, u/l case, convenient detached keyboard, programmable function keys, and a monitor that tilts and swivels.

Just as DASHER terminals' features make them easy to use, their attractive appearance makes them easy to fit into any environment. And of course they are solidly reliable and easy to maintain, a Data General trademark. For more details call your Data General sales office or nearest independent supplier of Data General terminals. Or send the coupon. Even a bit of Data General in your computer system is better than none.

Ashland Network Keeps Petroleum Products Moving

ASHLAND, Ky. — Ashland Oil, Inc. has developed a distributed data entry and processing network that reportedly will provide the company with a significant annual savings.

The network of 21 Sycor 350 intelligent data communications terminals reduces Ashland Oil's costs on each truckload of products shipped from company refineries and shipping points by reducing the time necessary to get an invoice to the customer. Former methods included either mailing or facsimile transmission of shipping documents to Ashland and preparation by keypunch for billing. Today when a customer truck leaves the refinery or shipping point with a load, the invoice will normally be mailed from the Ashland office the next morning.

Besides the time and associated cost savings, there are many other benefits from the network, according to D.H. Howard, assistant general manager of computer science and services. The actual "bottom line" savings, however, was what convinced the company to proceed with the plan developed during a 1973 study of how automation could best serve the company.

Oil Allocations

A good example of how this movement of data helped in a more humanitarian way was provided by the soon-to-be-legendary "Winter of '77." With the State of Ohio and Western New York virtually closed by bad weather, the Ohio River frozen to barge traffic, no mail moving and airports closed, the Ashland Oil data network enabled the company to allocate badly needed heating oil to hospitals, nursing homes and other priority users and tell its distributors where to send trucks to pick up oil, Howard said.

Most of the benefits from the network are not so dramatic, yet are just as important to the company, he noted. One obvious benefit was the reduction of a large keypunching job and the following edit and verification runs on the company's IBM 370/168. This represents a significant savings in people time and workload on the mainframe, Howard said.

In fact, switching the actual data entry from a central keypunch operation back to the source at refineries and shipping points has proved very successful, he stated. The user now has complete control of billing data sent to the computer, since the billing department controls the master terminal at its headquarters and the 21 terminals in the network.

The employees entering data at the source are barge and truck loaders, not computer-oriented people. Yet they have been receptive to the terminals, according to Bob Wessell, manager of invoicing for the corporation's petroleum company.

They have found the terminals easy to operate and have seen their paperwork cut significantly, now entering each shipment on the terminal only once, he noted. Under the old manual system, each shipment was logged for billing, inventory control, sales information and allocation allowance. "It's no wonder they like the new system. It has made their jobs easier and faster," Wessell said.

When a shipping point terminal is activated, it displays a function screen with 18 options from which the operator can choose the one currently needed. To process an order, the operator selects the order entry function and a screen format appears requesting a customer number, Wessell explained.

When the customer number is keyed, the 350 terminal checks its files on one of two diskettes and displays a list of products for that customer and requests storage tank numbers for those products being ordered, he said.

When the product code and tank number are entered, the terminal checks to assure that it is a valid product, used by the customer and stored in the specified tank. Finally, the amount of product shipped is entered and the entire transaction is stored on diskette.

Twice each day a master station terminal polls the network — an automatic operation, using Sycor's network control software and auto dial features — gathering shipping information for the billing department and storing it on magnetic tape. The tape is hand carried to the 370/168 for processing. Approximately 98% of all orders entered go straight through the billing cycle, a great improvement in productivity over former methods, Wessell commented.

To facilitate transmission of orders to the master 350, orders are hatched by the terminal in groups of 15 or less as specified by the operator entering an "end-of-batch" indicator. These batches are used to create hash totals which are in turn used to verify complete transmission at the master terminal, he added.

Operators at each terminal enter the products they receive and this data, combined with the shipment reports, give each location a complete inventory. Each terminal is equipped with a printer which is used to print reports including all shipments for the day, all receipts for the day, all allocations for the day, tank inventories and products shipped by product group for the day.

The terminals can also inquire into each record area for response to customer questions and for management evaluation, Wessell said. Division management can know the amounts of each product available at each location and effectively schedule sales and deliveries, he indicated.

The terminal that provides all this information includes 16K of memory, one-half million characters of storage on dual flexible disks, and an 80 char./sec bidirectional matrix printer. Ashland Oil looked at six remote job entry terminals in evaluating the project, with Sycor winning out over the others, Wessell stated.

Ashland computer science group used some innovative program modifications to enhance the operation of its network, he said. They used the overlay capabilities extensively rather than separate programs to load the 18 functions on the terminals.

To speed file search activities at the remote locations, they grouped eight customer identification numbers in one record, then created a disk address index of the records cutting average access time from 90 seconds to 10 seconds. Still not satisfied, they created a second index and reduced the average search time from 10 seconds to five, he said.

Initially they created the master diskette for each location at the headquarters allowing each location to update the master after installation.

"We want to keep the system standard except for some slight modifications," Wessell said. "No more 22 varieties of data coming in for billing. We now get a stable form and quality of information that benefits the company."

The best key-to-disk system isn't the best known...

but it will be.

With the many key-to-disk systems offered today, selection of the one most suited to your dispersed processing requirements isn't as easy as market share charts might suggest. There is only one system that offers you hardware and software designed to perform all data entry and front-end processing in the most economical manner. That is the Cummins Key/disk System.

And the word is getting around. Since introducing our unique KeyScan® System for combination OCR and key-to-disk applications, our key/disk capabilities have so impressed the industry, that today almost 40% of our installed systems are key/disk only. The fact that many of these users recognize that an OCR scanner can be added to the system if an application arises, was a minor consideration. The primary selection criteria were software, service, cost and ease of implementation and operation.

If you'd like to improve your data entry operation, do what so many others are doing and check out the Cummins line of dispersed processing systems.

At Dresser Industries

Single Terminal Combines Dual User Applications

ALEXANDRIA, La. — When Dresser Industries began consolidating its computer operations several years ago, Richard Womach began to create a distributed processing system using both on-line and remote processing terminals to handle his division's inventory control problems.

Three years later, Womach, manager of information services for the company's Industrial Valve Division, and his Alexandria Information Management System (Aims) have already hit their three target objectives.

Using the Data 100 Model 82 remote display system, Aims has provided increased control of the company's inventory of more than 55,000 parts, yielded a threefold improvement in the operation of manufacturing systems and maintained modest manpower increases in an operation which has experienced significant growth in output volume, Womach said.

Card Bound

In 1973 when Womach transferred from the corporation's Maryland division, there was no such system. An 80-character-bound, card-oriented IBM 360/20 was doing financial applications but was not "addressing itself to the real needs of the company," Womach noted.

"There was no automated material requirements planning system," he said, "and the manually maintained records could not keep pace with the problems of managing the relationships among a 200,000 item bill-of-material — problems only magnified by material shortages and extended vendor lead times."

Those problems, exacerbated by a Cardex system to handle 50,000 inventory transaction cards, put the Alexandria division at least a month behind in figuring out where it should have been and more than two months behind in producing customer acknowledgments.

To make more effective use of Dresser's computer horsepower (IBM 370/155 and 165), Womach selected a Data 100 Model 78 systems processor which was capable of handling tape and communicating with the mainframes, as well as handling the future volumes of data Dresser anticipated.

To build the data base stored on the company's computers in Pittsburgh, as well as continue with the everyday operations — a process which took nearly 18 months — Womach assembled a battery of IBM 3741s to enter the parts master file, bill of materials, 25,000 routing assignments, 4,000 manufacturing orders, 8,000 purchase orders and 45,000 customer orders.

The data was then converted by a diskette reader to 9-track, 800 bit/in. magnetic tape and hung onto the Model 78 for transmission at 9,600 bit/sec to Pittsburgh for processing and storage. Hard-copy reports were provided by the Model 78s, 125 and 600 line/min printers.

CRTs for Updating

With the initial application in place, Womach began to install IBM 3270 CRT terminals in the user areas to access and update the manufacturing files resident on the CPU.

This was done, he explained, not only to cut down on the growing mounds of paperwork, but to make the system as responsive to the user as possible. Forms which were previously handwritten and then keypunched and submitted to the job queue were now key-entered on the CRTs and transmitted directly to the mainframe, which updated the files every four hours.

After nearly 18 months of experience with the 3270s, however, Womach began to recognize the single function limitations of his on-line data acquisition system, and, once again, opted for Data 100 — this time its 3270-compatible Model 82 remote display system and an eight-station Keybatch system. "When the 3270's weren't being used for inquiry," Womach noted, "they just plain weren't being used."

The advantage of the new system, Womach said, is its multifunction capabilities. When the Model 82 is not being used for on-line inquiry or data acquisition, he noted, it is handling off-line data entry tasks in conjunction with either the Model 78 or the 5M-byte Keybatch system. Peripherals, including 600- and 125 line/-min printers, are likewise shared among the three systems, In effect, lowering the cost of the overall system.

"Having the same piece of equipment doing multiple functions," he said, "with multiple backup is a real boon to users at our various terminal locations." The end-users, apparently share Womach's enthusiasm; since the on-line network was initiated, the number of transactions has risen from 6,000 a month to more than 100,000 per month presently.

"With our on-line system," Womach said, "we now know immediately if we have a problem with deliveries — whether coming into or leaving the factory — and that has helped us control our inventory and maximize our efficiency." The improved visibility — never more than four hours old — has also allowed Dresser to schedule production in the proper priority sequence to balance stocks and improve the flow of work on the assembly floor on a continuous basis.

Better DP Coverage

Judged against a corporate checklist for manufacturing systems which specifies 12 items — from engineering and production data control, to capacity planning, to the order entry procesing, to purchasing — which Dresser believes is the best possible DP coverage, Alexandria scored an 87% performance rating vs less than 30% before Aims.

No Increase in Staff

Another big advantage to the system, Womach noted, was that while the number and sophistication of applications have increased tenfold, and sales revenue for the Louisiana division has doubled in the past three years, the number of people needed to maintain the records has increased only 19%.

With all of his equipment in place, Womach is now taking aim at a sophisticated "pass-through" network which would store the most commonly used data locally while maintaining the balance of the data base at the CPU.

IDES II.

IDES II is an advanced, application-oriented Level II Data Entry software package. It helps an Intelligent Terminal make maximum use of your data gathering network. Helps make your people more productive.

Now you can greatly streamline entry procedures; provide extensive editing and validation.

Operators key in only new data to the form and depend upon program control for instant data editing and interactive validation routines.

Arithmetic functions are supported, as are batch controls, page subtotals, form totals, batch balance checks, conditional branching forward or back throughout up to 255 form pages.

Operators can reference the central data bank during data entry; to see if an insurance policy is active or cancelled before processing a claim, or if a freight station is served before creating a waybill.

Entered data is stored locally, ready for a polled request from the computer or for later batch transmission. Your entire data entry staff can continue to process data even when the computer or communication lines are down.

If your business generates data at remote action centers, why not learn more about IDES II from INCOTERM? Write or call for complete details.

More power to your terminal.

Microprocessors Will Foster More Intelligent CRTs

By Barry Kelman
Special to Computerworld

Microprocessors are rapidly replacing hard-wired logic as a means for control in interactive and editing terminals. Micros are even replacing minicomputers as controllers for intelligent terminals. Ever since microcomputer-based CRT terminals were introduced there has been a steady stream of new micro products into this area.

Three types of CRT terminals currently exist in the industry: interactive, editing and intelligent. Each type of terminal fulfills a distinct set of user requirements.

The interactive terminal is most frequently used in time-sharing or conversational situations, an environment requiring frequent access to data for inquiry or addition. Since the data is not processed, there is no need to hold the information for massaging or updating.

In applications requiring minimal amounts of processing along with editing and update capabilities, the editing terminal is more practical. Due to their increased storage capability, editing terminals allow the remote user to access and update information.

An intelligent terminal is basically defined as one which allows the user to program the terminal. Some intelligent terminals allow only remote job entry, requiring the programs to be loaded from the host computer. Other intelligent terminals allow the user to program, test and compile at the terminal. As long as the processing is performed by the terminal itself, that terminal is intelligent.

True Intelligence

With the use of microprocessors in all three types of terminals, even the most basic "dumb" terminals have intelligence. Micros can be found performing quite sophisticated multitasking terminal control operations. But these terminals cannot be considered "intelligent" in the traditional sense of the word. This intelligence is used to perform a fixed task and is not user-programmable.

This new source of intelligence in computer terminals is not available to the end user: it is not programmable.

Additional hardware and an appreciable amount of memory would be necessary in the interactive and editing terminals for the microprocessor's intelligence to become available to the user. Read-only memory (ROM) can be more expensive than the CPU.

A more complicated screen interface and keyboard than are now found in nonintelligent terminals would also be necesary to make these terminals programmable. And the costs of all these improvements would be self-defeating.

It would be impractical to upgrade an interactive terminal to an editing or intelligent version as user needs change. Replacing logic board arrangements, keyboards and option selection hardware are involved. By the time the user upgraded these components, the terminal's entire electronic package would have been replaced.

Certainly, the microprocessor-based terminal trend will continue. The benefits of this advanced technology are numerous, especially at the system design and programming levels.

System designers and programmers are finding that many capabilities formerly offered as "pay-extra" options are now included in the basic purchase price of the terminal.

Terminal software is becoming more sophisticated. The system designer and programmer are finding their jobs much easier.'

Kelman is manager of software development, Perkin-Elmer Data Systems, Terminal Division, Randolph, N.J.

Mo-Pac Freight Cars Tracked Through Memorex CRT Net

(Continued from Page S/2)

matching empty car supply with demand.

By maintaining an up-to-the-minute inventory of the current supply and demand for empty cars, the mainframe assists in making visible the car distribution plan and in communicating distribution decisions to yard offices. Upon receipt of reports of empty cars, the 370 scans the list of outstanding orders for cars to find appropriate ones for the assignment.

One of the ways that TCS has reduced the costs of running the railroad has been a 10% to 20% reduction of the time that "foreign" cars (those of other railroads) spend on Mo-Pac rails, he indicated.

"We receive foreign cars at an interchange point and we may take them to the other end of the system to another interchange point. The faster we can move these cars back to the owner the better, since we are charged a rental rate based upon each car's value," Brennan explained.

Another advantage of the system has been an increase in cash flow, he said. The TCS's autobill feature makes it easier and faster for the railroad to produce shipping documents.

Railroad's transportation center answers customer questions using CRTs to access shipment records.

Here, 20 of the display terminals are used in the regional accounting office. Other Memorex units are scattered throughout the headquarters building for use in inquiry, administrative message switching and management and control of piggybacks (truck trailers) on the railroad.

The Memorex stations were gradually installed in the facility over several months, replacing about the same number of similar display stations from another vendor.

"The predecessor CRTs, which we had purchased, were sold to a broker. That money covered the cost of the Memorex 1377s. The bottom line of the transaction was our obtaining a better and newer station for no cost," Brennan claimed.

"We considered several plug-compatible display stations. Crispness and quality of the display, feel of the keyboard, maintainability and price were among the main factors we weighed," he added.

Intelligent Terminals

The Ontel OP-1 series... User programmable... Flexible, Versatile, Reliable...Modular structure...Up to 64K of memory...Designed for field upgrade of features...Cluster or stand-alone configurations...Up to three microprocessors... Easily programmed... Full range of communications controllers and peripheral interfaces...

Ontel terminals...your best hardware buy for the money.

That's intelligent

and Common Sense

Ontel software packages... Comprehensive... Designed for today's needs... Includes an extensive set of utilities... Word processing... Text editing... Forms generation... Two high level languages... Communication emulators... Diagnostics... And more.

Ontel terminals...your best software buy for the money.

That's common sense

Ontel

Ontel terminals...tops in reliability and software...Priced to be competitive and affordable.

And that's the right price for the OEM market

Multi-Vendor Terminals Help Design Nuclear Plants

By Mal Stiefel
Special to Computerworld

SOUTHBORO, Mass. — Yankee Atomic, designer of nuclear power plants for its parent New England Electric System, combines on-line and remote batch terminals (RBTs) tied to Control Data Corp. 6600 and 7600 computers on the Cybernet timesharing network to serve its engineering staff.

The system, including four Digital Equipment Corp. LA36 Decwriter terminals, eight Teleterm 1030 portable terminals made by Computer Devices and two Harris Data Communication RBTs — a Cope 1200 and a Model 1620 — supports such applications as core and reactor design, nuclear fuel management, safety analysis and structural design.

The system is also used for radiation analysis, based on readings taken from badges worn by all workers at half a dozen New England Electric nuclear power plants.

The 1620 RBT is used in dual Hasp emulation mode. It is connected all day long to Cybernet centers in Rockville, Md., and in Minneapolis over 9,600 bit/sec lines. When the operator enters a job through the 1620, he designates which computer to use and the terminal places the data on the proper line.

The Hasp protocol, acquired three months ago, replaced a UT-200 emulation package. With Hasp, data compression is improved and two RBT peripherals can be used for output at once, according to company spokesman John Vossahlik.

Under UT-200 emulation, only one output device could be addresed at a time, Vossahlik pointed out. Thus, if one job required output to be routed to the Calcomp 936 drum plotter tied to the 1620, and the following job required a printout on the 1620, the printout would wait until special characters inserted in the data stream by the host computer signaled the end of the plotting job.

Alternatively, in the present system, two printing jobs can run at once, since the 1620 configuration includes two line printers.

With Hasp, the data streams for the two local output devices are interleaved, Vossahlik continued.

Both Hasp and UT-200 support interleaved communication to two different computers from the 1620 terminal.

Speedy Delivery

Some interactive terminals are located in engineering offices in Westboro, about a mile from the RBTs in Southboro, and in other Yankee Atomic facilities. Since output for most jobs that originate at the interactive stations is sent to the RBTs, a courier service connects the Westboro and Southboro plants to speed delivery of output to users.

In addition, an edit routine allows the user to send selected critical details or summary statistics back to his own interactive terminal for a "quick look," while the bulk of the output is sent to the RBT.

The interactive terminals, operating at 30 char./sec, can't absorb masses of data, Vossahlik explained.

Several years ago, before the terminals appeared, Yankee Atomic employed students to bring job decks from its Boston office to CDC's public terminal in Cambridge. The first in-house terminal, shared with the parent company, was a 2,000 bit/sec UT-200. It was quickly outstripped, so Yankee Atomic replaced it with the Cope 1200 in 1973.

Again the demands on the system grew. The company considered bringing a computer in-house but decided against it. Management felt the company couldn't risk failing to meet deadlines for critical reports because of a computer outage. So they brought in a CDC 734 RBT in 1975, running with a 4,800 bit/sec dial-up line to beef up the installation; the Cope 1200 stayed on.

Unfortunately, the 734 "couldn't take the beating," Vossahlik said. A Data 100 terminal was considered briefly before the company turned back to Harris last year for the 1620.

Over time, the 1620 has taken on additional core — 65K bytes in all — communication hardware, the plotter and a tape drive to reach its present capability level.

To round out the system, the interactive terminals were acquired 18 months ago, when the RBTs were moved to Southboro from the Westboro plant.

Nuclear Advisor

Yankee Atomic plays several roles as a service organization supporting the parent company, New England Electric System, and its constituent utilities: New England Electric Co., Northeast Utilities and others.

Yankee Atomic is primarily responsible for nuclear power plant engineering; it also operates the nuclear power plant in Rowe, Mass., and it assists and advises the operators of other nuclear plants in New England.

The company's responsibilities in power plant engineering include development of requirements, environmental studies and the furnishing of data to the federal government's Nuclear Regulatory Commission, Vossahlik said.

Thus, as a contractor like Westinghouse, General Electric or Combustion Engineering develops plans for a plant, Yankee Atomic will look over its shoulder, checking calculations, using independent methods to verify the contractor's design.

Several software packages are used on the Cybernet network in these computations. For example, the PDQ program, part of the Lifetime Evaluation and Analysis of Heterogeneous Systems package, is applied in core and reactor design and in establishing initial fuel loading for the plant.

Structural analysis is carried out with Stardyne, an engineering package.

The Relap-4 and Loca programs are used to determine whether safety devices will protect the plant, personnel and the surrounding community in the event of an accident, Vossahlik said.

The radiation analysis system, developed in-house, includes a data base of cumulative lifetime radiation of individuals employed in the nuclear plants, he added.

Mal Stiefel is a staff member at the Mitre Corp., Bedford, Mass.

One for All & All for One
AVAILABLE NOW!
BURROUGHS, HONEYWELL, UNIVAC EMULATION

U

The DELTA 4050:
one display terminal for all computers...
all computers for one display terminal

Presenting the DELTA 4050, the microprogrammed video display terminal with "emulation PLUS" capability for BURROUGHS, HONEYWELL, UNIVAC, and other computers and display terminals. If you're looking to expand or enhance your system and lower your costs at the same time, look into the DELTA 4050 now.

- Complete emulation for BURROUGHS TD820, HONEYWELL VIP7700, UNIVAC Uniscope 100/200, and others—to meet your present and future application requirements
- Microprogrammed—up to 16K memory available
- Full text editing capabilities
- Optional full duplex communications monitoring
- Ideal for data communications systems on single modem, daisy chained, single line configurations, multidrop or direct connect systems
- Prompt delivery, nationwide service in over 150 locations
- Reliable, around-the-clock performance
- For user programmability ask about the DELTA 4550 with computer-loaded protocols

Our new DELTA 4050: the one for all & all for one video display terminal that's all you need to get your job going, and keep it going. Contact us today for more details or on-line demonstration.

Intelligent Terminals Impact Multiple Applications. . .

The trend with today's data communications terminals clearly is from dumb terminals to intelligent and from a single medium to multimedia.

Terminals are growing in intelligence and function, increasingly guiding users when they input data, editing transactions and storing data at the terminal. Many of today's terminals have integrated communications control and network interface capabilities to peform tasks which were previously done by separate components.

New terminals can be both multiapplication and special-purpose. The current crop of Electronic Funds Transfer terminals are highly special-purpose and are usable for little else. At the same time, general-purpose CRTs with printers can, through their intelligence, perform a wide variety of functions programmable by the end user and serve both specialized and generalized applications.

Terminals are increasingly modular. Users can buy plug-in circuit boards to increase the function or capacity of the device or expand its media. They can select sensed, keyed, verbal and/or scanned data entry and can have displayed, voice printer and/or facsimile output.

The cost of terminals is decreasing. Basic terminal elements (e.g., casing, power supply, display) account for a major proportion of terminal manufacturing costs today. Unit costs are fairly stable, ranging from under $1,000 to $5,000 depending on capability.

The cost of an intelligent terminal is rapidly approaching that of a dumb one. The electronics (logic, memory) don't add much cost to the device. Consequently, newer terminals give users more "smarts" for the same dollar.

Terminals are becoming a rising and more obvious portion of total system costs as the number in use grows and as other system components, such as the central processor — that big machine back at the home office — drop in cost more rapidly.

There are three major implications of the technological trends affecting terminals.

First, planners and users of terminals should deploy more capability at the terminal level. That's almost a truism today, but it is backed by solid benefits, including lower network costs, less reliance on a central computer and higher reliability.

Second, users should isolate changeable functions (such as formats, input data that is dynamic and not absolutely fixed) in programmable read-only memory, if they are using that type of device, or in functionally discrete software modules.

More importantly, users should invest now for future flexibility. New uses will be developed for the terminal after the immediate objectives are attained.

Furthermore, an intelligent terminal is unlikely to impact only one application area. Work flows and communications patterns will change, generating new applications such as word processing. If users plan ahead for flexibility, they may be able to "piggyback" new uses on the devices they install now by adding modules instead of replacing devices.

In addition, terminals may need to share networks with nondata applications. Perhaps the terminal itself may be used for or act as a controller for such nondata as electronic mail or facsimile transmissions.

Transmission Techniques

With transmission links (the "wires") the trend is from private (or leased line) to public (switched or shared lines) and from analog to digital transmission techniques. Many new services will use digital transmission technology and the market will support a number of shared, public networks.

For example, users can choose between Bell's Digital Data Service and Southern Pacific's Datadial (based on Datran's original service). In addition, private microwave nets are being set up by large users or by users with a high volume of data to transmit from one building to another.

The packet and specialized message-switching services, such as Telenet or AT&T's Transaction Network Service, are another proven and growing area of communications.

Satellites are increasingly being used by commercial users who now can lease fixed "lines" through Westar and others and will soon be able to share demand assigned circuit capacity from several vendors as well as the new Satellite Business Systems venture.

Higher bandwidths and faster speeds characterize the trend.

Integrated switching disbursed throughout the network and fast connection times for switched (shared) services are also in the offing. Today, for example, Telenet and Tymnet can, from the time the last destination characters are received at a node, establish a path to the destination within 300 msec in most cases. That's fast switching. This kind of speed makes switched services viable alternatives to private-line networks.

Use of networks is changing. Where in the past the usage profile on communications lines tended to be continuous, now it is becoming more erratic and sharply

Computerworld

. . .Providing Users With More Equipment Flexibility

(Continued from Page S/8)

spiked. The reason is that there is a lot of interaction between the operator and the system occurring at the terminal.

Then, at some point, the terminal accumulates a block of information and wants to transmit it or it needs to "talk" to somebody else (another terminal or a computer), resulting in a burst of exchange between the terminal and the remote point, usually at high speed. This sequence is followed by more continuous interaction between the operator and the terminal, another burst exchange and so on.

The cost of transmission is declining, but much more slowly than other components of the system. The costs are becoming usage sensitive (such as recent and proposed Wats tariff changes) and distance insensitive (in private-line services as well as Wats).

While costs have dropped, recent and proposed changes (Telpak elimination, revised individual private-line rates and Wats restructuring) have shaken the foundation of transmission and made it necessary to rethink the entire approach. As a result, communications link costs are becoming a larger, more visible and much more critical portion of total system costs.

One of the implications of these trends in transmission links is that a wider variety of options need to be evaluated. In addition, dedicated application and network communications links tend to be inefficient and thus costly so they will be less prevalent in the future, especially since the electronics needed to control shared use systems is dropping in price so dramatically.

Planners need to build in enough flexibility to interface several transmission services with varying protocols and varying speeds. This is technically feasible today using intelligent interfaces.

Planners should consider shared systems or shared links for developing "bursty" applications.

The trends in network architecture and protocols include the following:

Star networks are phasing out. They cost too much and expose the entire network to failure of a critical component. This centralized architecture doesn't conform to the way businesses want to organize and run their information systems.

There is a tendency toward ring networks, such as onsite rings or digital loops, with IBM's logical loop interface as an example, or offsite rings, such as the packet services — some large-scale users are building their own packet rings where they have several processors to link together.

There is also a trend toward hierarchical networks and, of course, hybrids.

More and more users are interested in high-level, unified communications network architectures such as Honeywell's Distributed Systems Environment, IBM's SNA and Digital Equipment's Decnet. Control protocols are becoming standardized. For example:

- The packet protocol seems to be favored by advanced users and for good reasons. There are some inefficiencies involved but the standard interface discipline it imposes more than offsets any inefficiencies or extra costs. The international standard X.25 is the protocol the world appears to be settling on.
- There are specific high-level data link controls such as Synchronous Data Link Control, High-Level Data Link Control and Burroughs Data Link Control. People are beginning to use them, but usually only when needed to use a desired terminal.
- Of course Bisync will be with us for some time to come, so networks of links and processors will need to interface various protocols. For example, most large organizations will have a line that has a Bisync terminal on it and will want to plug it into a larger network that is basically a packetized ring network.

There are several implications of these trends in terminal network architecture and protocols.

First, users should separate the communications networking functions from applications characteristics. Users probably should dedicate a set of processors to network functions — don't let the applications get mixed up in them.

Users should integrate separate networks to reduce the redundancy of communications facilities throughout the organization. To do this, the network should support a variety of processors and terminals operating diverse applications.

Users should plan to provide a rich variety of services and service levels within the network to create a single service with multiple potential uses. This serves the dual purposes of economy and maximizing the possible communications paths to foster a freeflowing interchange of information.

Lastly, users should maximize architectural and protocol compatibility to make all this diversity work together. One way to manage diversity and change is to set up a generalized network with increasing application specificity accomplished through hierarchical layers of terminal hardware and control protocols.

This article was based on a recent presentation by staff members of the consulting firm of Booz, Allen & Hamilton, Inc., New York.

"With Sycor 440 terminals, we increased productivity 43%."

Jim Millington, Project Manager
Chicago Title Insurance Company

Chicago Title Insurance Company, with more than 160 offices and 1600 agents, provides title insurance on real estate nationwide. This kind of insurance increases speed and efficiency in completing real estate transactions and protects against loss due to title defects. Chicago Title issues over 600,000 of these policies per year.

"Historically, title records have been kept by hand," Project Manager Jim Millington says, "but the volume of title actions in many densely populated areas demands speed and accuracy that handsearch simply can't deliver. That's why we developed OPTICOM — a computerized system for indexing the name and land records essential for providing title services — and made it available to our branch offices and agents.

The Sycor 440 tackles the heavy-volume areas.

"OPTICOM — which includes the Sycor 440 — is the most cost-efficient way we've found for handling heavy volumes of title actions," Millington explains.

"Information about a specific piece of property or about individuals is stored on the 440's 10mb disk. The data is entered on terminal display stations with eight special formats which cover each type of action concerning a piece of real property. The terminal controls formats and guides the operator, so data errors are almost completely eliminated.

The Sycor 440 makes instant name searches.

"In addition to collecting, editing, verifying and sorting all our data," Millington notes, "the Sycor 440 also lets the Chicago Title branch or agent make name and property searches against up to 30,000 current records. Instantly.

"But the real payoff is that our users get more work done faster. Our studies show that they've been able to increase productivity 43%. And the Sycor 440 requires less-experienced people to achieve this productivity level.

Sycor 440 reduces operating costs.

"Our increase in productivity and Sycor's attractive lease structure help us hold down operating costs," Millington reports. "And in addition to the daily capture of OPTICOM tasks, we also maintain our accounts receivable and customer name and address files by using data entry programs on the Sycor 440.

"The records created by OPTICOM and these data entry programs are transmitted daily to Chicago Title's CPU for processing. Reports generated and updates to the OPTICOM file are transmitted back to the local 440s overnight. We feel that this approach to distributed processing is the most economical way to provide our users with timely information. I'm really pleased with the 440's performance."

Get the whole story.

Find out how Sycor wins the title on increased productivity. Send in the reply card today. Or write: Sycor, Inc., Corporate Offices, 100 Phoenix Drive, Ann Arbor, MI 48104. Phone (313) 995-1170.

Better yet, call one of our sales offices. We're in the Yellow Pages under "Data Processing Equipment."

The Sycor 440 is a clustered processing system. It is available with cassette or diskette interchange, up to 20mb of storage and eight video display terminals.

Sycor puts computer power where the work is.

Optimal Terminal Selection Process Held Vital For Efficient Network

By Dr. Howard Frank
Special to Computerworld

Data communications systems are playing an ever increasing role in today's corporate and government environments. Network planners are beginning to realize the importance of overall planning and design of these systems.

There is increasing acceptance of the network planning process which involves such steps as problem definition, requirements analysis, feasibility studies, technical strategy evaluation, analysis, design and simulation, system specification, acceptance testing and operations and maintenance. However, few users realize the importance of including terminal selection within this planning environment.

The goal of the data communications manager is to provide the most cost-effective system which meets the needs of users. In fulfilling this goal, the manager generally attempts to integrate various aspects of the system.

Network integration may occur at a number of conceptually distinct levels. For example, sharing of common carrier facilities by multiple users on FX lines, Wats lines and so on are readily used approaches. Until the recent Telpak tariff elimination, large users were able to make efficient use of a tariff structure to integrate their communication requirements.

A more detailed level of sharing involves the use of common functional communications devices and their associated communication lines. Examples of such devices are concentrators, message switching processors and packet switching nodes.

Another approach toward integration is the sharing of multiplex facilities and their lines. This sharing is often very effective in reducing network costs.

At a more detailed level of integration, there is sharing of ports, modems, terminal controllers, the terminals themselves, space and staff for facilities and the sharing of application programs and computing resources.

Integrated Functions

An alternative approach to sharing is the integration of the planning and management functions across the entire spectrum of data communication activities. Via centralized management, cost savings can be realized from discounts available for bulk purchases, the overhead associated with procurement, billing, facilities maintenance and recordkeeping can be reduced, and sufficient technical expertise can be amassed in one place to plan properly.

In this area, the selection of proper terminals, combined with the design of the communication system can also make a major impact. To illustrate this point, the following example is taken from a real-life situation.

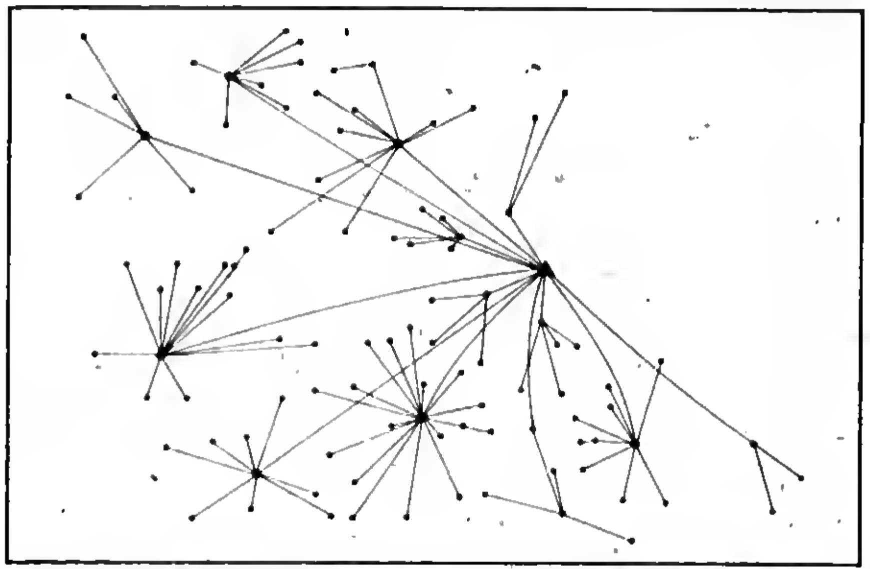
The system considered is a time-sharing network which was developed to provide services to approximately 1,000 terminals distributed over a wide geographic area. The system had been designed in two stages.

A communications network was developed based on the use of multiplexers distributed remotely from the central time-sharing computer. Users would access the central computer by dialing in to the nearest multiplexer using in-Wats or FX lines. The selection and payment for terminals was left to the end user.

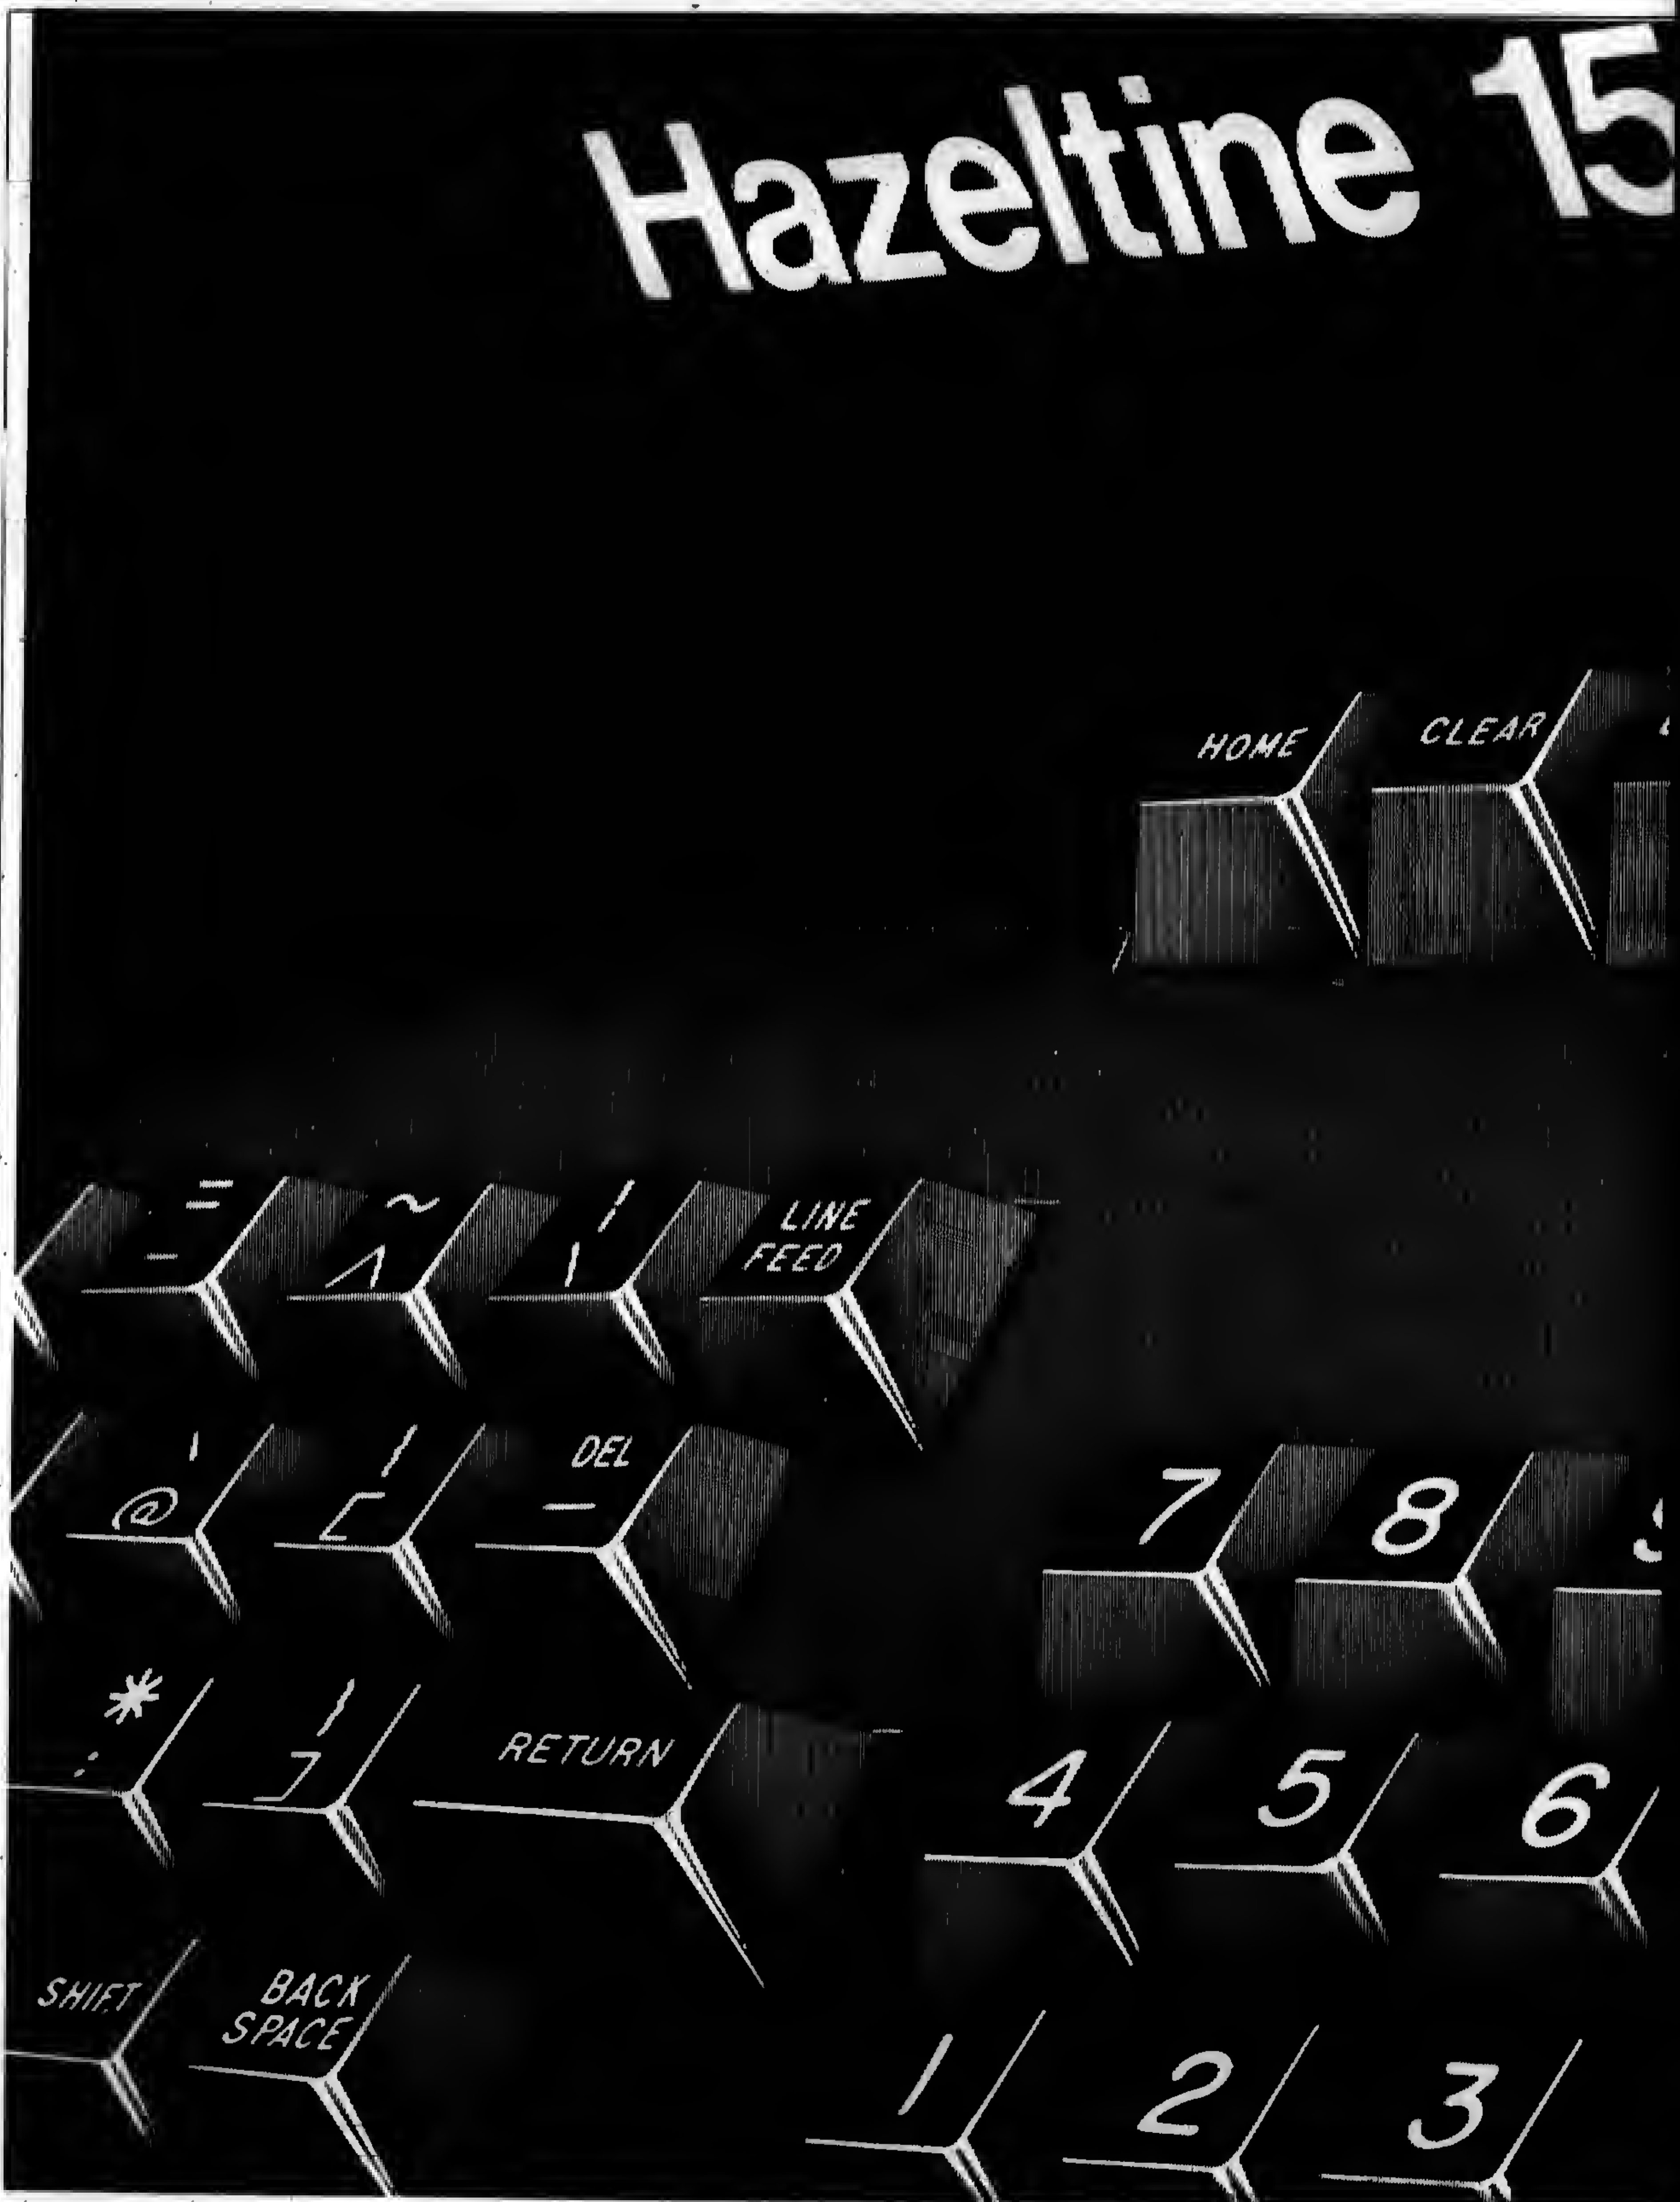
The result of this partition was that virtually without exception, users chose the least expensive terminal which could be employed within the system. This terminal invariably was a simple low-speed (non-CRT) printing terminal. The fragmentation of the planning and design problem thus led to a system which had a generally low-cost terminal population, but a high-cost communication network.

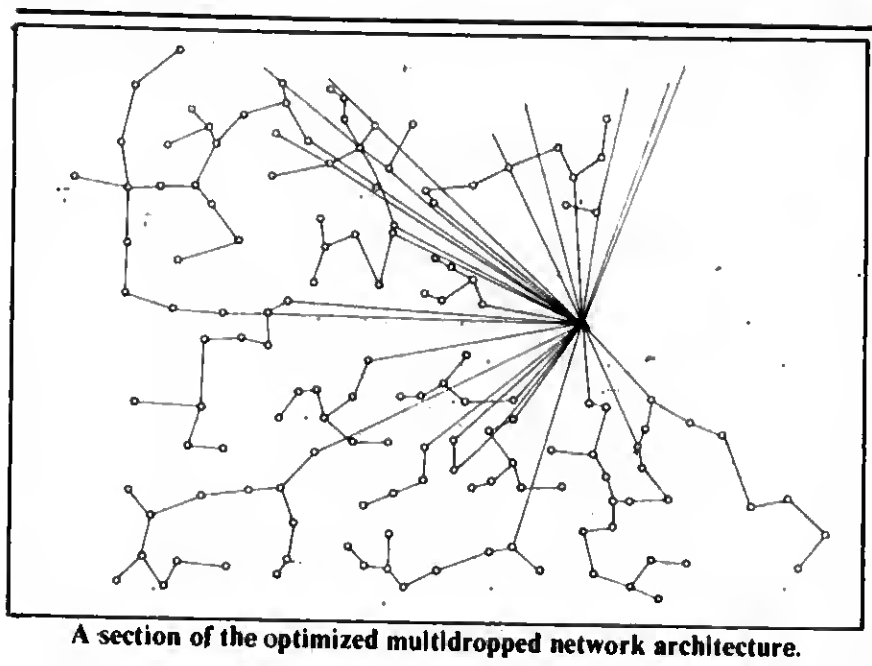
Unfortunately, after implementation of service, users began to experience dissatisfaction with the speed and quality of their ter-

(Continued on Page S/13)



A section of a multiplexed network with low cost terminals and a high cost communication network.





A section of the optimized multidropped network architecture.

Networks Depend on Terminal Selection

(Continued from Page S/12)

minals and began to upgrade to high-speed devices. Within less than a year of operation, it became apparent that many of the low-cost terminals would shortly be replaced by higher speed CRT devices. The resulting trend was toward a high-cost terminal population with the high-cost communication network that had been developed to serve the more primitive terminal population.

The alternative to the above situation was one in which the communication network planner selected both the terminal and the network design. An optimization study led to a numher of interesting conclusions about the best communication network structure and the proper management structure within which to make planning and purchasing decisions.

This study considered the uses of alternative communication techniques for serving the time-sharing terminals. In particular, the study considered the use of multidrop communication lines with higher speed, buffered terminals sharing these lines.

The conclusion reached was striking. If the network planner had control of the terminal selection as well as control of the network, an entirely different network architecture and terminal selection would have been made. With this different architecture, the planner would have been able to achieve, for the same cost, a system with high-speed terminals instead of one with low-speed terminals.

To achieve this, several decisions would have been made. The terminals selected for the current system were Model 35 teletypewriters with speeds of 10 char/sec. These terminals are not capable of responding in a polling environment. In order to operate in a multipoint environment, the terminals must be upgraded by adding huffering and addressing capabilities and their modems must have higher speeds.

An alternative would have been to make a different terminal selection (e.g., buffered CRT devices) at the beginning of the network planning process. For this selection to be cost-effective, either the incremental cost of the terminal must be offset by the communication cost savings derived from the multipoint configuration or the users must be willing to pay for the greater capahilities of the new terminal.

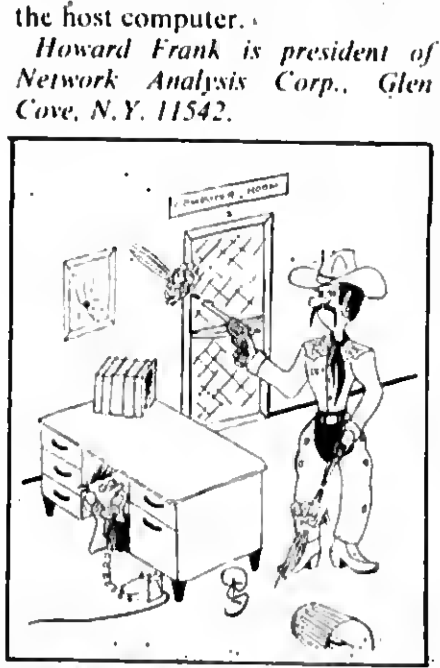
The total cost of the terminals with greater capabilities would have heen met hy the savings achieved hy the multipoint network as compared with the multiplexer system.

Based on the existing system constraints, the communications cost for an optimized multiplexer system was ahout $50,000/mo. The multipoint line configuration reduced the communications costs hy ahout 50% or $25,000/mo. Moreover, projections of future traffic requirements increased the ahsolute savings of the multipoint versus the multiplexer approaches to over $38,000/mo.

These savings, when equated to the potential dollar pool available for terminal enhancement via either capital expense or lease, generates an amount greater than $1.5 million. This pool would amply cover the cost of the terminal enhancement, thus providing substantially greater terminal capability with no additional total system cost.

This example is typical of many systems. It illustrates the benefits of a comprehensive network planning process which includes in its domain all elements of the system ranging over the user terminals, the communication network and the host computer.

Howard Frank is president of Network Analysis Corp., Glen Cove, N.Y. 11542.



'Computer Maintenance? Could You Describe the Troubleshooter You Sent Over This Morning?'

Hazeltine puts performance into economy terminals

The Hazeltine 1500 Series—our third generation of microprocessor-based terminals—puts performance up front! Every feature you need to speed and streamline your data communication operation is available in one of three levels of performance. No extra cost options! Features include:

- Integral numeric keypad.
- Switchable upper/lower case.
- Ultra high-resolution video display—designed and built by Hazeltine, the Company that has pioneered video displays for over three decades.

Best of all, you get all this "Hazeltine Performance" at an economy price, with a nationwide network of trained Hazeltine specialists available for on-site service. Call for a convenient demonstration.

ABSOLUTELY NO DISTRIBUTED PROCESSING SYSTEM OFFERS YOU ALL THESE 10 FEATURES EXCEPT SERIES 21 FROM MDS:

1. An intelligent data entry system which installs as easily as a keypunch and is fully operational as soon as you plug it in.

2. Formatted data entry software—fully developed and ready to use.

3. On-site upgradability so you can utilize a powerful programming language specifically developed for interactive processing with CRT/Keyboard.

4. Growth capability so you can accommodate your peak production periods by allowing expansion to up to four operator stations—any time—on one controller.

5. Modular design so you can configure a system to fit the requirements of your various locations—exactly, now and for the future.

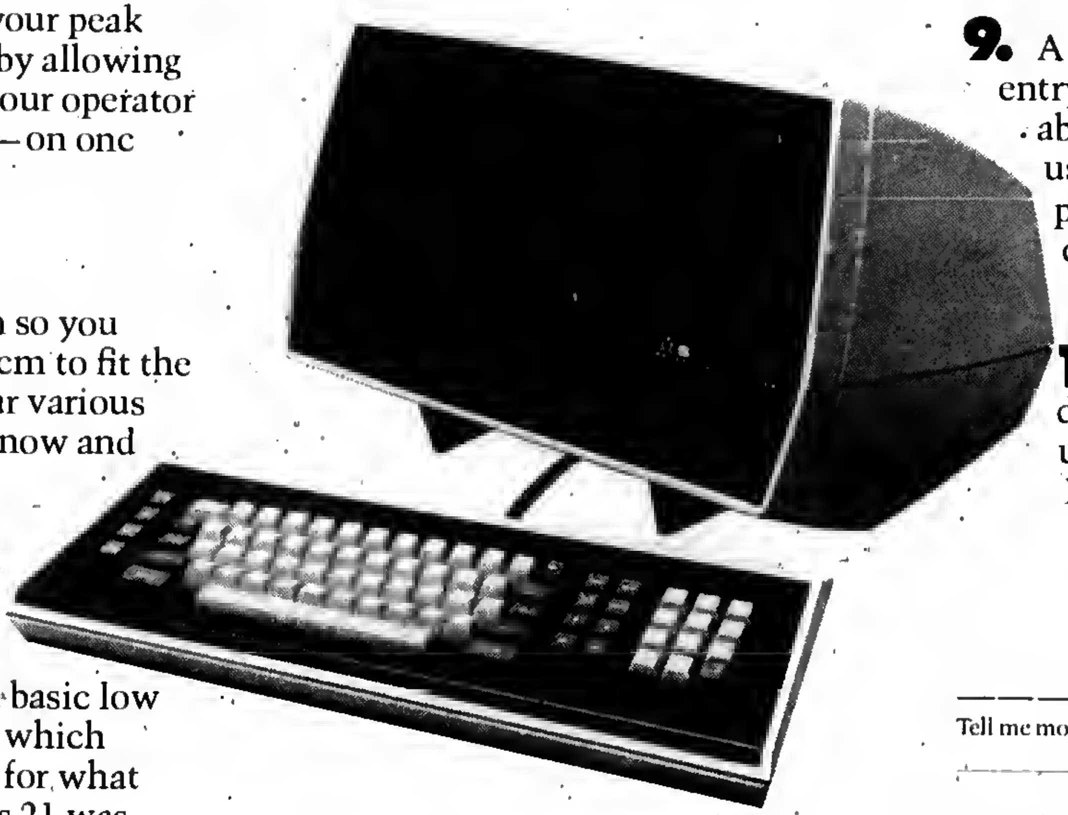
6. A comprehensive line of peripherals, like large capacity disk drives, tape transports and printers, together with powerful systems software enabling high performance transaction processing.

7. Communications in BSC or SDLC, or both.

8. A large 15-inch CRT display in 480 or 1920 characters for easy operator prompting and sight verification of data.

9. A choice of either data entry or typewriter-style movable keyboards so you can use experienced data entry people or those with only clerical experience.

10. Popular flexible diskette recording media using IBM Basic Data Exchange conventions.



You can start with a basic low cost configuration—which means you pay only for what you need now. Series 21 was designed to take into account all your future distributed data processing system requirements by way of its upgradability. A Series 21 system with 4 operator stations costs only $110.50 per month per operator station, including maintenance, on a 3-year lease.

We would like to tell you more about Series 21—and why we say it's absolutely the best distributed data processing system available anywhere.

Series 21—a solution for today—and tomorrow. Call MDS Executive Headquarters at 201-540-9080, or fill out the coupon and find out more.

THERE'S A WORLD FULL OF MDS SOLUTIONS.

Tell me more about Series 21. I'm interested in applying it to ______________ applications.

Off-Line Terminals Handle Chilton Subscriber Data

RADNOR, Pa. — By 3 a.m. on the morning after each of the three Presidential debates, an IBM 370/145 here had processed the results of nationwide voter opinion surveys conducted by Chilton Research Services, a division of Chilton Co.

The surveys were among more than 300 Chilton completed last year for clients in business and government. Like most of those surveys, the opinion polls which followed the Ford-Carter debates were conducted by telephone.

"We have more than 40 IBM 3277 CRT terminals connected directly to our computer," explained James Wyatt, operations manager for Chilton's Management Information Services department. "Typically, our interviewers enter response data directly into those terminals during phone conversations, prompted by messages displayed on their terminal screens," he said.

"Because of the need for fast turnaround, we employed more than 100 interviewers to sample the reactions of voters throughout the country immediately after each debate. We did not have enough terminals to use the on-line system," he noted.

Instead, interview results were prepared for the computer on an Inforex 3300 terminal system, according to Wyatt. "That's a good example of the way the 3300 supplements our on-line system," he said, "not only for our market research operation, but for other applications as well."

Uses Microprocessors

The 3300 includes a terminal control unit which employs microprocessors for the validation of entered data. The control unit can accommodate as many as 16 CRT stations, each with a keyboard and visual display device.

The 3300 system is used for applications that do not have to be entered immediately into the CPU. The 3300 controller is programmable so that it can be modified for various applications, Wyatt said. Data entered into the 3300 terminals is batched on the controller tape unit and from there it is manually transferred to one of the eight 3420 IBM tape drives that are connected to the 370/145, he said.

Chilton's system consists of a control unit with 11 terminals, a high-speed printer, 45 in./sec tape drive and a 10M-byte disk drive.

The company keyed a total of more than 7 million records on that system during 1976. The system is used in the Chilton Book Co.; for subscription fulfillment; in handling more than 400,000 "bingo" response cards submitted by readers of Chilton's trade magazines; and for corporate personnel, payroll and other accounting applications, in addition to market research.

"We installed our first Inforex system, a Model 1301 intelligent terminal system, in 1972," Wyatt recalled. "Since then, we've continued to upgrade our installation up through our current 3300. In general, the advantages of the 3300 are that it is easy to program, offers powerful editing capabilities which reduce the need for verification and maintains response times even while it is running several jobs simultaneously," he said.

Chilton selected the 3300, in part, for its data validation capabilities, according to Wyatt; however, "many of our jobs require manipulation of a very large data base. We use CRT terminals on-line to the 370 for those jobs," he said.

For many companies, an on-line system would not be cost-effective, Wyatt noted. "The same was true at Chilton until we put several applications on-line, all of which can share the same major software package. For less complex jobs, or for special requirements such as the Presidential debates, the 3300 system offers an alternative to our on-line system," he said.

Wyatt said Chilton's market research operation, for example, surveyed the attitudes and opinions of more than 1.5 million people during 1976 for commercial, industrial and government clients. The results of more than 700,000 of those interviews entered Chilton's CPU via the 3300.

"The decision whether to to use the on-line terminals or the Inforex CRT equipment depends on the number of persons to be interviewed, the complexity of the questionnaire to be used and whether the survey method will be telephone or hard copy. Normally, the phone interviews are conducted using the on-line terminals, while we use the Inforex CRTs to key hard-copy questionnaires," Wyatt explained.

Chilton uses on-line terminals for subscription fulfillment in its magazine publishing division, but also offers subscription services to other publishers.

The 3300 is used more extensively in the Chilton Book Co., in an order entry application involving some 1,500 active titles as well as new and out-of-stock books.

Approximately 80,000 invoices are generated each year with data keyed from the 3300 CRTs. In addition to the entry of approximately 300 orders per day from wholesalers and retailers, the 3300 is used to update an 8,000-name customer master file and to update the division's master inventory record.

TR-10

The TR-10 is designed to serve a variety of customized data entry applications: Factory Data Collection; Inventory Taking; Security; POS; EFTS; etc. It is a stand alone, send/receive device, which utilizes a single or dual-line alphanumeric display.

Communications to computer, MUX or poller concentrator can be via either RS232 or TTY (20mA) disciplines. Terminal will operate in half or full duplex modes either buffered or unbuffered (Serial, ASCII, Asynch).

Led status indicators can be customized to depict operational modes and state of terminal and line. Keyboard incorporates eleven key numeric cluster with ten additional customer-selectable option keys. Interface provisions exist for: Parallel Interfaces; Badge Readers; Strip Printers; Cassettes, etc.

A versatile-low cost data entry terminal

TR-10's can be hooked together in contention or multi-drop loops via CTC's Micro-Based MUX/Concentrator

Multiple CRT terminals are used to enter and retrieve customer information that is stored on a system maintained by National Sharedata Corp.

Harris CRT Terminals Access Integrated Customer DP Records

OKLAHOMA CITY, Okla. — Increased customer service, reduced waiting times and equipment flexibility are principal reasons why intelligent terminals are being used here in several departments at Liberty National Bank and Trust Co., the largest bank in the state with assets of more than $1 billion.

Using a computerized central information file system on a dual host computer, Liberty National Bank has installed 40 Harris 8170 keyboard/display terminals and four 88 char./sec printers in its commercial loan, credit authorization, stop payment and central information departments.

Nine Account Areas

Liberty Bank personnel can obtain information on any of its customers in nine areas of activity and display that information simultaneously on the terminal screen. Activity areas include checking, savings, installment loan, mortgage loan, commercial loan, credit card, certificate of deposit and safety deposit box. Personnel also can determine if a customer is a Liberty Bank shareholder.

"This automated system enables us to keep updated files on a bank's thousands of customers and to relate all the customers to various account numbers. Many customers have several accounts and many of the accounts involve different individuals," Jack Hoherecht, vice-president and cashier at Liberty Bank, said.

The Harris terminals, installed in February 1976, are on-line to the Oklahoma City DP center of National Sharedata Corp., a nationwide facilities management company that specializes in providing bank-related DP services. Terminals at Liberty National Bank communicate at 4,800 bit/sec over telephone lines to dual IBM 370/145 computer systems and use National Sharedata's on-line software package known as Solis.

"Because of the programmability of the Harris terminals, we can upgrade to other mainframe compatibility with minor hardware and software modifications to the seven controllers for the 8170 terminals when the time comes," Lelan Nelson, vice-

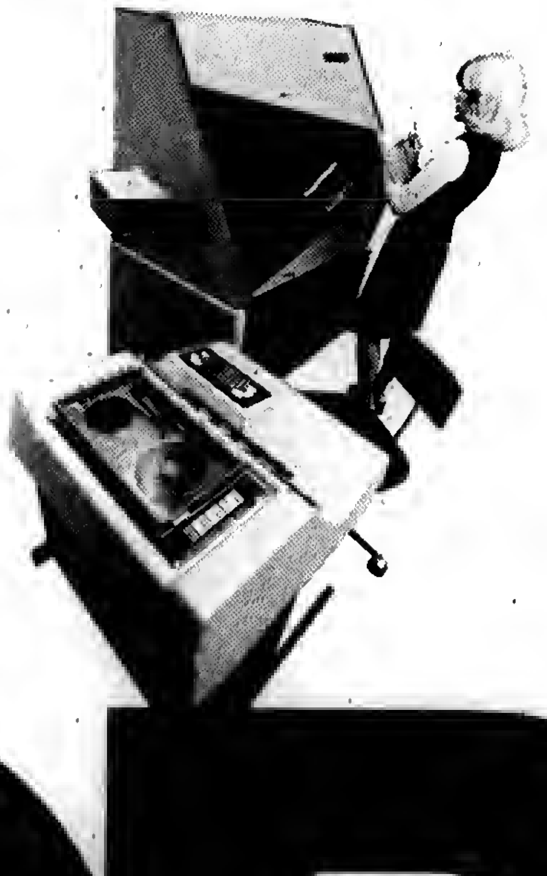
'Dawson, Is There Any Truth in the Rumor You Used Company Computers to Work Out a Vegas System?'



Make the right choice —
Intelligent terminals —
or OCR —

Intelligent terminals are reducing data entry costs every day. And so are our Laser OCR-ONE optical character recognition systems!

If you're considering intelligent terminals, we believe you ought to be considering OCR too. We make a loud, clear claim that for many, many applications, OCR can top intelligent terminals hands down in efficiency and cost effectiveness. And we'd welcome the opportunity to prove it.

Something else to think about. OCR and intelligent terminals can be a money-saving natural at working together in a multi-media system. They complement each other very effectively in a multitude of applications.

You owe it to yourself to find out ebout our cost reducing Laser OCR-ONE optical character recognition system. Contact me today. Our systems applications staff will help you make the right choice.

president of systems at Liberty Bank, said.

Nelson explained that the bank is emulating IBM 2260 asynchronous terminals, but will upgrade to emulate 3270 binary synchronous terminals within the near future to provide greater capability to the bank.

Account Inquiries

Using 40 terminals, bank employees perform about 4,000 transactions per day, most of them inquiries into the centralized customer account file to respond to questions from departments within the bank, as well as from customers and local merchants.

"The majority of the inquiries involve checking and savings accounts," Ruby Kirkbride, central files officer, said. "A typical savings account record will show the current balance, average balance, projected interest, last year's interest paid and withdrawals for the current quarter. The installment loan information includes the amount of the loan, payment date, current balance, late notices and payoff amount," she said. The balance due on an individual's credit card is also available.

"By having all of this up-to-date information instantly available at the touch of a terminal keyboard, we are able to provide immediate response to all inquiries," Kirkbride said.

Two Harris terminals and a printer are used in the bank's commercial loan department to handle about 1,000 transactions per month involving loans of $25,000 or more, according to William K. Martin, assistant vice-president in that department.

Commercial loans record department uses Harris 8170 interactive terminals to retrieve information.

"Any of our loan records is easily available by typing the customer's account on the terminal keyboard. Almost immediately, we can see the credit status, date the account was opened, permanent and temporary historical data and status of three categories of current liabilities — secured, unsecured and indirect," Martin explained.

"Additional information on indirect liability, for instance, can be displayed and would include account numbers, note numbers and percentage of liability for that individual," Martin said. "These can be expanded even further to determine individual accounts, who guarantees the notes and individual customer names, if required.

"Other pertinent data that can be displayed on the terminals includes due dates for customer financial statements, whether a loan is on hold, if the line of credit exceeds the approved amount and if it has expired," he said.

The terminals also are used to add new customers to the bank's central file and to update existing customer files, Martin said. "We are constantly updating our files with new notes, note renewals and note extensions," he said.

Five Harris terminals and one printer also are used in the bank's BankAmericard department to provide instant credit authorization to local and area merchants who call the bank. When calls are received, the user's account number is typed into the computer through the terminal keyboard. Credit information is immediately displayed on the video screen of the terminal and then given to he calling merchant.

To service BankAmericard holders who are visiting from other parts of the country or have had their BankAmericard cards issued by their local bank, Liberty Bank uses a Harris 810 intelligent terminal to access the BankAmericard national network and thus provide local credit authorization as if the cardholder were a local or area resident.

Harris terminals are also used by the bank's personnel to retrieve information on bad, lost or stolen checks and to issue "stop payment" notices for customers.

The dual IBM mainframe computers are equipped with two Periphonic front-end communications processors that link terminals to the mainframe. Other supporting equipment includes 16 large-capacity disk drives, 24 magnetic tape drives, five line printers, and five check reader-sorters.

Harris terminals installed in the stop-payment department of Liberty National Bank & Trust of Oklahoma City provide access to customer accounts.

$59 a month.
Petty cash.

You can lease the new Hazeltine 1500 from Marketing Dynamics for less than $2.75 a day — which is probably less than you spend for a quick lunch.

The Hazeltine 1500 is a true state-of-the-art terminal with *standard* features that read like the other guys' extra-cost options.

Hazeltine 1500

STANDARD FEATURES
☐ Separate numeric keypad.
☐ Switch-selectable upper/lower case.
☐ Cursor addressability.
☐ Line insert/delete.
☐ Switch reversible video.
☐ Full 24 × 80 display.
☐ 12-inch screen.
☐ High-legibility 7 × 10 dot matrix.
☐ Automatic repeat on all keys.
☐ Locally available maintenance.
☐ Fully warranted by Hazeltine.

Excellent dealer opportunities available.

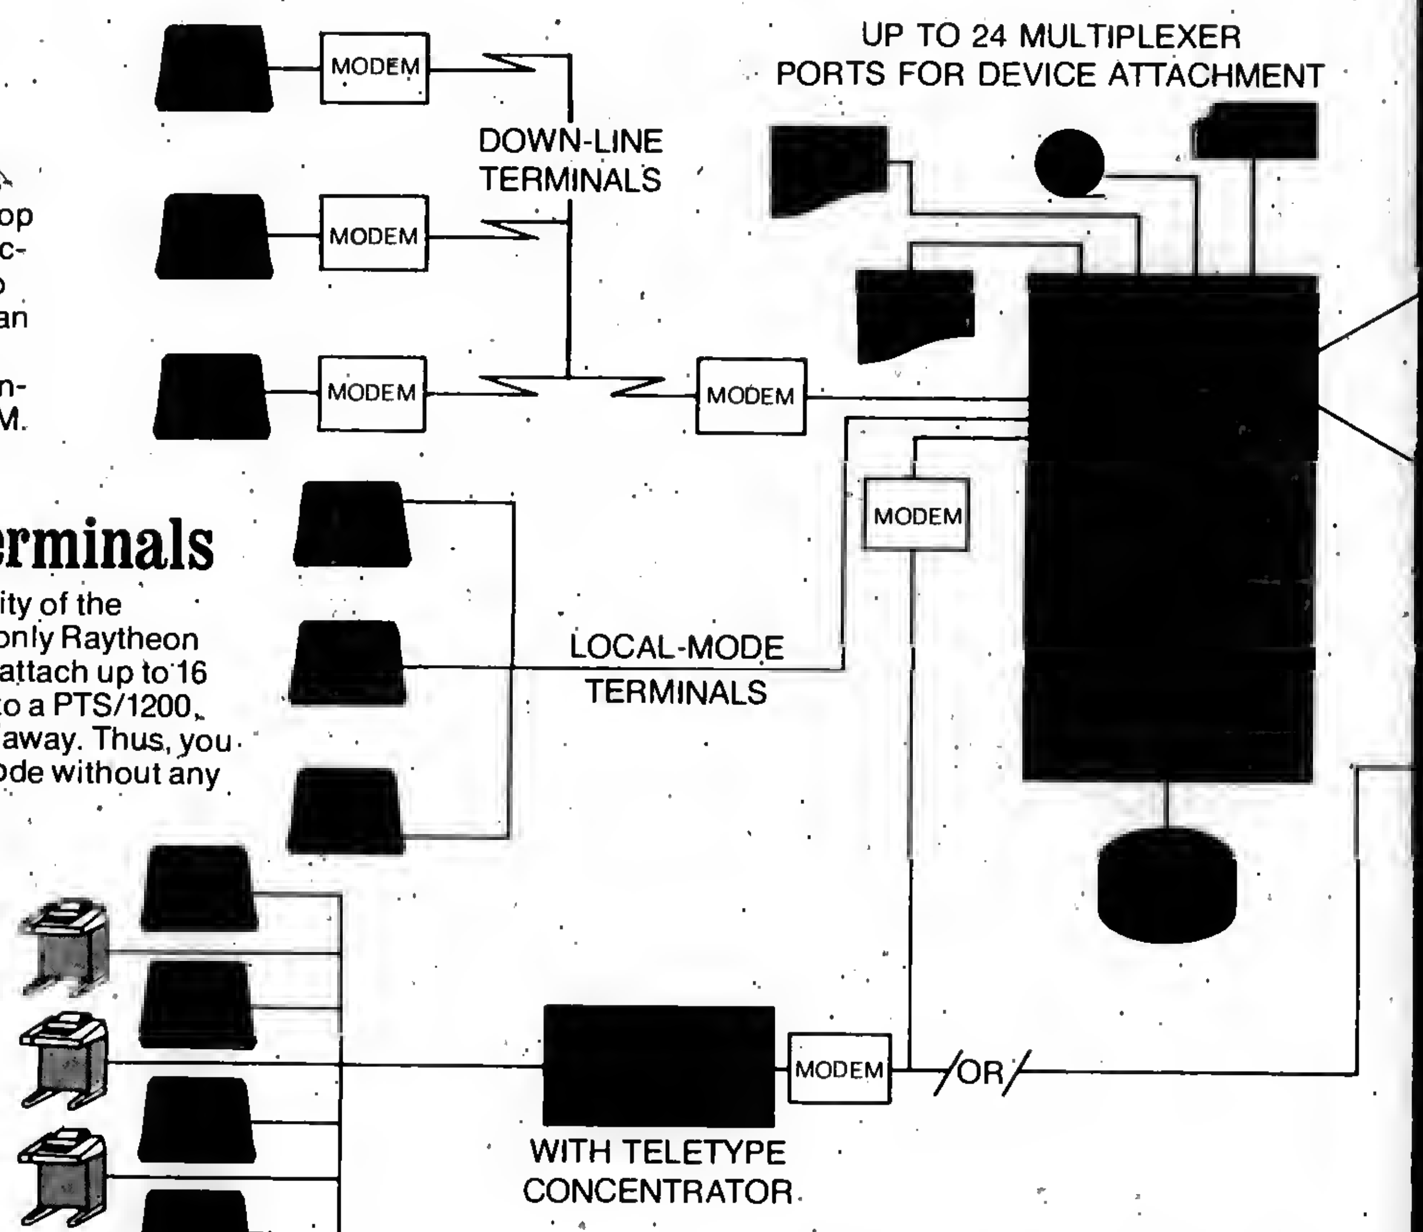
3270/3790 Users: There were always at least five Now, there are at least ten.

In the past three years, Raytheon has become the largest independent supplier of intelligent terminal and distributed processing system alternatives for IBM 2260, 3270 and 3790 products. Better performance, better pricing, better delivery, greater flexibility and greater intelligence were the capabilities that Raytheon offered. The result: users like yourself purchased more than 20,000 Raytheon terminals and distributed processing systems.

In the past three months, Raytheon has been busily adding more and more capabilities to its PTS-100 intelligent terminal and PTS/1200 distributed processing systems. The reason: to give you more and more reasons to keep buying Raytheon.

Here are ten good ones. Watch this space in coming months for at least five more.



MODEM
MODEM
MODEM
DOWN-LINE TERMINALS
MODEM
UP TO 24 MULTIPLEXER PORTS FOR DEVICE ATTACHMENT
MODEM
LOCAL-MODE TERMINALS
MODEM
OR
WITH TELETYPE CONCENTRATOR

1. Downline Terminals

A brand new capability of our PTS/1200 system that lets you assign the task of multi-drop terminal control, and even applications processing, to a Raytheon system, rather than to your mainframe. Of course, the PTS/1200 can communicate in either batch or interactive modes—or both concurrently—to your mainframe as needed. You can't get this from IBM.

2. Local-Mode Terminals

A long-standing capability of the PTS/1200, and one that only Raytheon offers. It means you can attach up to 16 terminals in local mode to a PTS/1200, at distances up to a mile away. Thus, you get a network in local mode without any TP requirements.

3. Teletype Concentration

Announced two months ago, after more than a year of user operation, this unique feature lets you add teleprinters to the same transmission lines as your 3270-type terminals, with maximum performance and data rates preserved. Know anyone else with this $80 a month feature?

4. Immediate Deliveries

Raytheon has always been known for prompt delivery. We know that when you need it, you want it. There are five new capabilities described in this ad. All five will be in production by June 30th. This year—1977.

5. Lowest Prices

A major attraction of Raytheon alternatives to 3270/3790 has been pricing. Even with IBM's recent price reductions, our pricing schedules permit you to obtain far more capabilities than IBM offers—at rental or purchase rates that are up to 27 per cent below IBM.

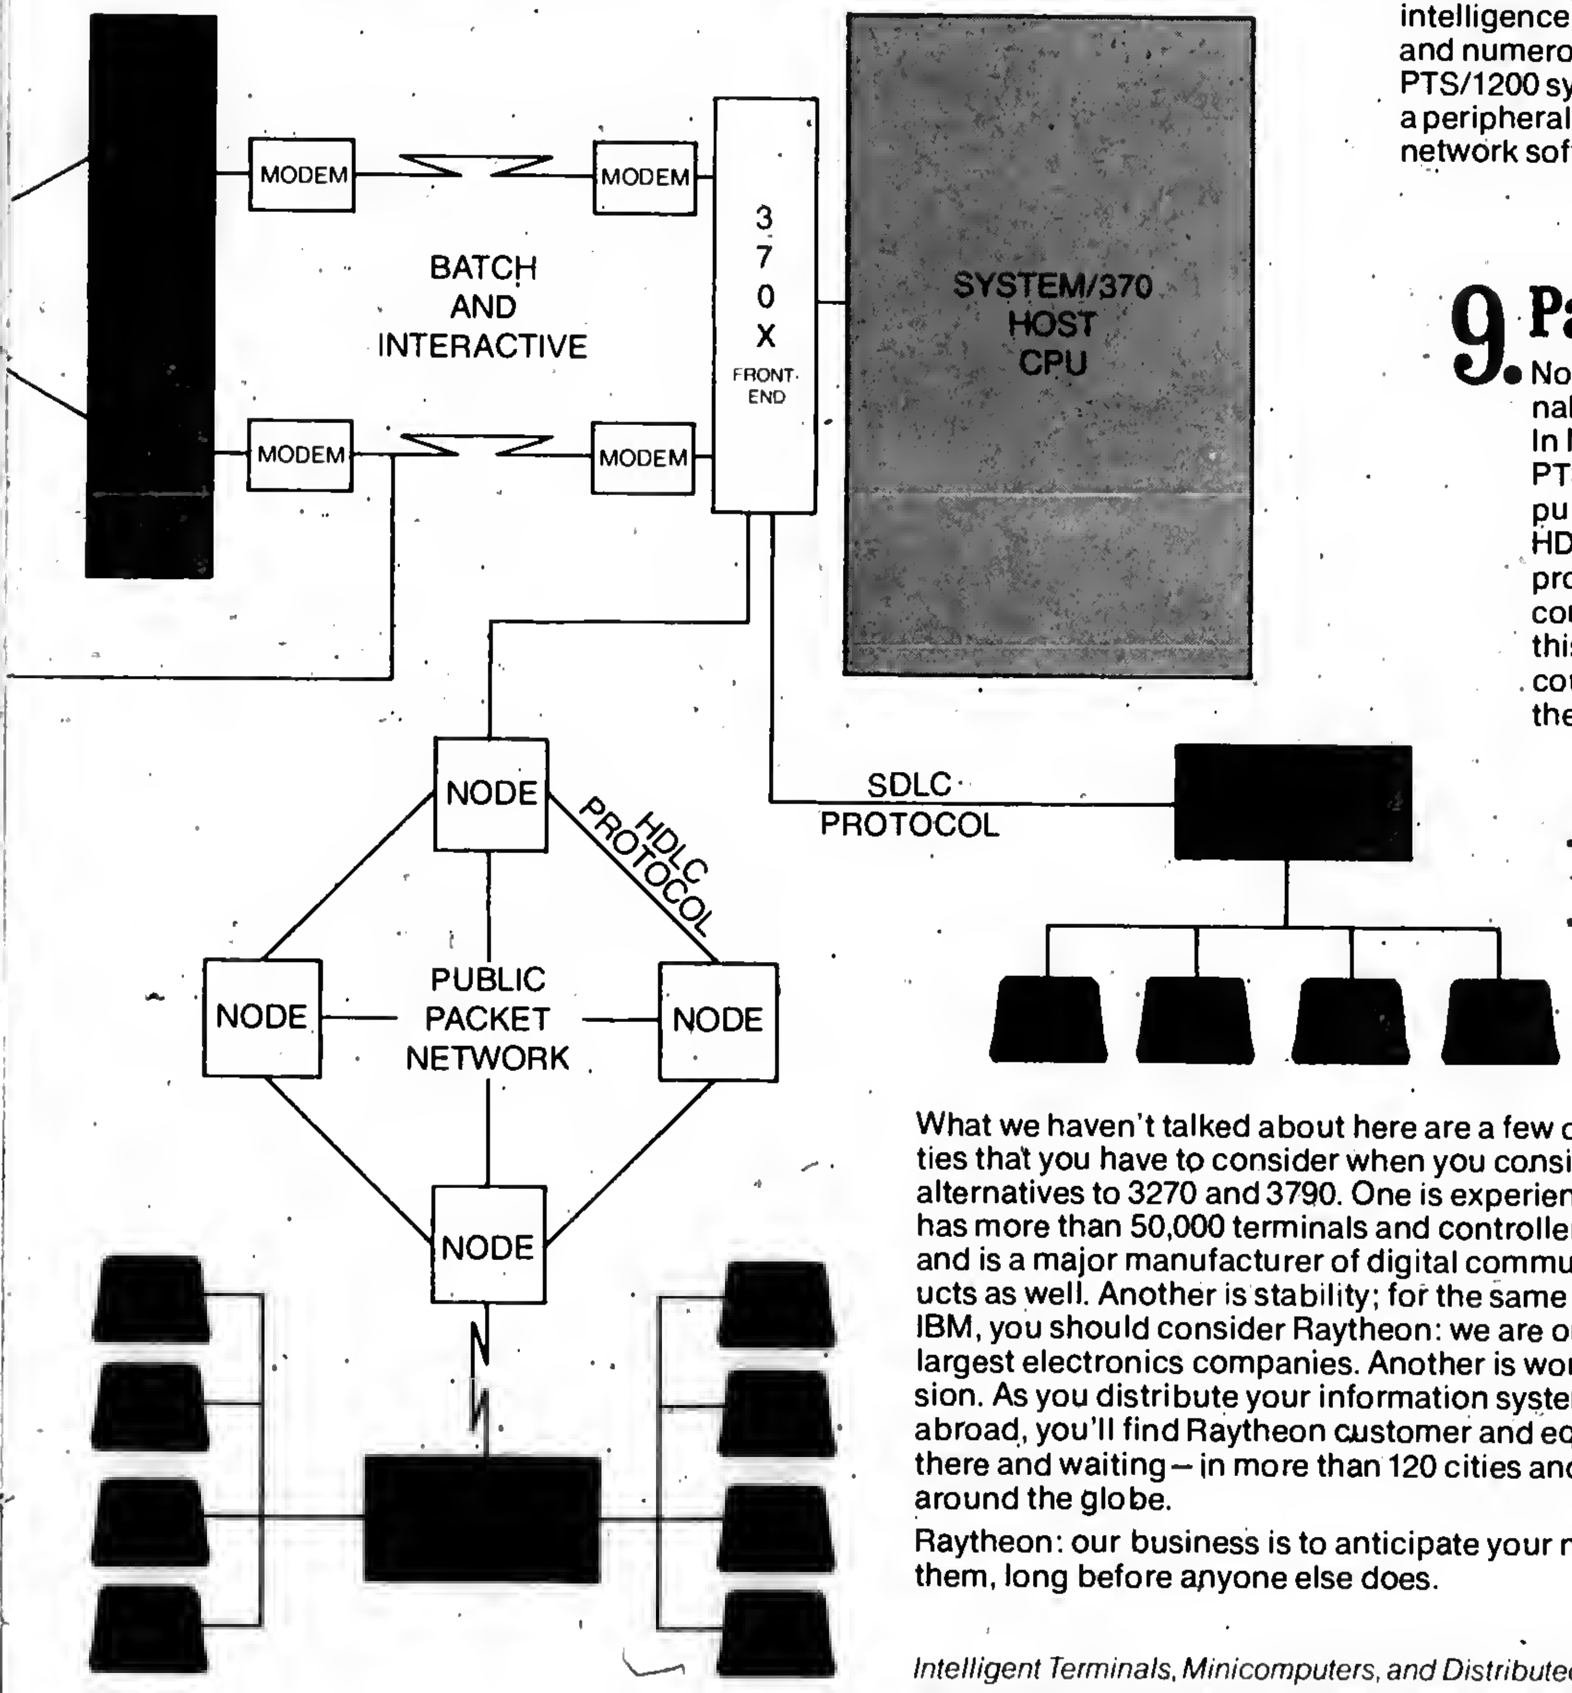
6. Ten Times Larger Data Bases

In a distributed processing system—anyone's distributed processing system—you need disk storage capacity adequate to handle the workloads. Raytheon has just announced a new 320-megabyte disk capacity for its PTS/1200 system. That's 10 times larger than the 3790's.

good reasons to choose Raytheon.

7. Simultaneous Interactive and Batch Communications

Two months ago, Raytheon demonstrated what no one else has—true 3270 concurrency. Our 3270 emulator lets you communicate interactively on a transaction basis with your host CPU. Our 2780/3780/HASP emulator package lets you—at the same time—communicate in batch mode. What counts about that is immediacy: you can do both right now, without any additional applications or front-end software development. And especially, no VTAM or NCP hassles.



8. Total Programming Freedom

This long-standing feature of Raytheon systems needs repeating. Because of the combination of high-level language, very large intelligence capacity, powerful macro routines, and numerous emulators, PTS-100 and PTS/1200 systems treat your host CPU like a peripheral. The result: data networks without network software development.

9. Packet Network Connection

Not with TTYs or ASCII-based terminals, but with 3270-type CRT devices. In March, Raytheon demonstrated its PTS-100 terminals operating on a U.S. public packet network under both HDLC line protocol and X.25 device protocol. We are the only major U.S. company operating such terminals on this international standard in other countries. Now we have it for you in the U.S.

10. SDLC Operation

And yes, every system in the PTS-100 family operates under SDLC protocol if you want it to. Or binary synchronous. Or HDLC. Or 1006. Or 2848/2260. Or Uniscope. Among many others.

What we haven't talked about here are a few other capabilities that you have to consider when you consider Raytheon alternatives to 3270 and 3790. One is experience—Raytheon has more than 50,000 terminals and controllers in use today, and is a major manufacturer of digital communications products as well. Another is stability; for the same reason you like IBM, you should consider Raytheon: we are one of the world's largest electronics companies. Another is worldwide dimension. As you distribute your information systems here and abroad, you'll find Raytheon customer and equipment service there and waiting—in more than 120 cities and 35 countries around the globe.

Raytheon: our business is to anticipate your needs and meet them, long before anyone else does.

Ohio Leads with Law Enforcement Terminal System

COLUMBUS, Ohio — Ohio's acronym for its terminal-based law enforcement system — (Law Enforcement Automated Data System (Leads) — is aptly chosen since the state has been in the forefront of developing systems for public safety over a long period.

Recently, enhancements to Leads became operational making it what is believed to be the largest single site, terminal-based, law enforcement computer installation in the U.S. and possibly the world.

Nearly 800 terminals at remote sites throughout Ohio are now linked via data communications lines to a large-scale Sperry Univac 1100/42 multiprocessor computer system installed in the 41-story state office building here.

Serving the computers is one of the largest disk storage data bases to be found anywhere with a total of 10.24 billion characters of information stored on 80 disk drives.

Looking over map of 400 terminals in Ohio's Leads police network are (left to right) Staff Lieutenant Eugene R. Howell and Major Ted G. Gentry of the State Highway Patrol.

In contrast to many states, with separate computers for major departments, the Bureau of Motor Vehicles (BMV) and the State Highway Patrol, both forming part of the Ohio Department of Highway Safety, share the same multiprocessor computer complex and data base.

The State Highway Patrol is responsible for 400 terminals tied in to the system. Sixty of these terminals, Sperry Univac Uniscope 100 visual displays, are installed in 57 highway patrol posts. Another 60 Uniscope 100 units are installed in sheriff's offices and higher traffic volume police departments in the state.

The Uniscope devices are equipped with attached printers allowing hard-copy versions to be produced of any messages appearing on the screen. Another 280 low-speed NCR Model 260 buffered, nonimpact, printer-type terminals are installed in lower volume police departments.

In addition, 125 terminals forming part of computer systems operated by the police forces of Hamilton County (Cincinnati), Cleveland and Toledo also funnel into the Columbus DP center. In the near future, four major cities in Ohio — Columbus, Dayton, Akron and Youngstown — are expected to interface their local computers and have direct links to the Columbus computer center.

For its part, BMV utilizes 25 Uniscope 100 displays at headquarters for administrative purposes and program development and 230 Incoterm display terminals located primarily in remote sites for driver license renewal.

The 1100/42 multiprocessor system consists of two command/-arithmetic units and two input/-ouput units with a combined storage capacity of 458,000 words. In the event one processor should suffer a technical malfunction and "go down" the other processor can automatically take over.

The 1100/42 system is front ended by two communications symbiont processors (C/SP) to handle the high volume of communications flowing into the system. One C/SP supports the real-time network and the other supports demand and on-site peripherals. Each C/SP is capable of handling 96 communication lines.

The 80 disk drives consist of 72 Univac 8440 drives and eight Univac 8433 units. Each drive has an average access time of 30 msec.

Also part of the system are eight Uniservo 20 magnetic tape units, two 0768 printers with a speed of 1,000 lin/min, two 0716 card readers and one 0774 card punch, all from Univac.

Stored in the BMV portion of the data base is pertinent information on 7.9 million drivers' licenses and more than 8 million vehicle registrations in the state. Included in the drivers' license file are records of "points" accumulated by drivers involved in traffic violations.

The State Highway Patrol stores information in the data base on wants and warrants, stolen cars, stolen or lost license plates and vehicles used in felonies.

The system supports a vast complex of communication lines. These consist of four high-speed 4,800 bit/sec data lines going to remote CPUs on the system in Cincinnati, Cleveland, Toledo and BMV; 20 high-speed 2,400 bit/sec lines linking other CPUs and the Uniscope 100 display terminals to Columbus; 28 medium-speed 1,200 bit/sec lines connecting the Incoterm terminals to the system; and 20 low-speed 150 bit/sec lines connecting local police departments using the NCR terminals.

Special communications circuits also connect the system with the

(Continued on Page S/21)

If you're looking at your communications piece by piece...

The Bell System recognizes that many seemingly unrelated business problems are really communications problems in disguise.

So we've provided our account executives with the skills and equipment they need to take a company's problems, and our solutions to them, and fit them together into a total communications system.

State Public Safety Agencies Utilize 800 Terminals

(Continued from Page S/20)

FBI's National Crime Information Center (NCIC) in Washington, D.C., and the National Law Enforcement Teletype System (Nlets). Nlets serves more than 4,000 police departments in a nationwide network primarily designed for handling administrative messages.

The Ohio system has a communications network monitor station to provide centralized control of all communications input and output lines.

One of the pioneer states in establishing a computer-based law enforcement system, Ohio started its Leads system using an IBM 360/40 in 1968.

The heavy increase in the volume of traffic on the system necessitated an upgrading to computers operating at higher speeds and with greater backup capacity in the event of equipment failure. As a result, the former State Department of Finance, now the Department of Administrative Services, contracted for a Univac 1106 multiprocessor system in 1973 and then upgraded to the 1100/42 system in 1976.

The 1100/42 system uses Data Management System/1100 (DMS/1100) in conjunction with the Transaction Interface Package (TIP) to facilitate on-line transaction processing including data base accessing.

TIP is an extension of the 1100/-42 operating system which provides an interface between a user-written transaction program and the communication complex facilitating transmission to and from remote terminals.

DMS/1100, a data management system, permits a transaction program written in Cobol to access records within the data base in real-time, interactive and remote job entry modes.

Law Enforcement Aid

Col. Adam. G. Reiss, superintendent of the Ohio State Highway Patrol, said Leads has been a boon to law enforcement in the state.

"We've made great strides in going from a teletypewriter system to a computer-communications network; now we can have the information in the files available in a matter of seconds rather than days or even weeks as in the past," he said.

"Presently our troopers are averaging 200,000 checks a month through the system to keep on top of the stolen car problem," he added.

"Beyond the highway patrol's own use," he continued, "we've found that city, country and township police forces throughout Ohio are enthusiastic about the system. In order for these organizations to obtain the maximum benefit from the system, we operate an ongoing training program using our troopers. As part of this program, a patrol representative personally contacts each local police department at least once a month. We believe these contacts pay dividends in the long run as correct operation is essential for the maximum effectiveness of the system."

Ohio State Highway Patrol operator uses Univac 120 Uniscope CRT to access Leads network.

Major Ted. G. Gentry, in charge of the Bureau of Technical Services of the Highway Patrol, noted that currently the response time for receiving data on a terminal from the computer averages about 3 to 5 seconds vs. 30 seconds before Leads began using higher performance computers.

"Basically the system has improved considerably," Gentry said. "The shorter computer response time was a 'must' for us because of the constantly higher volume of transactions we're handling.

"When we started the Leads upgrade we were averaging about 70,000 transactions daily. By the time we cut over to the new computers in March 1975, we were up to 122,000 transactions daily. Presently we are running at about 175,000 transactions daily," he said.

"We're continually adding more local police departments to the system which in itself adds still further to the volume of messages," he noted.

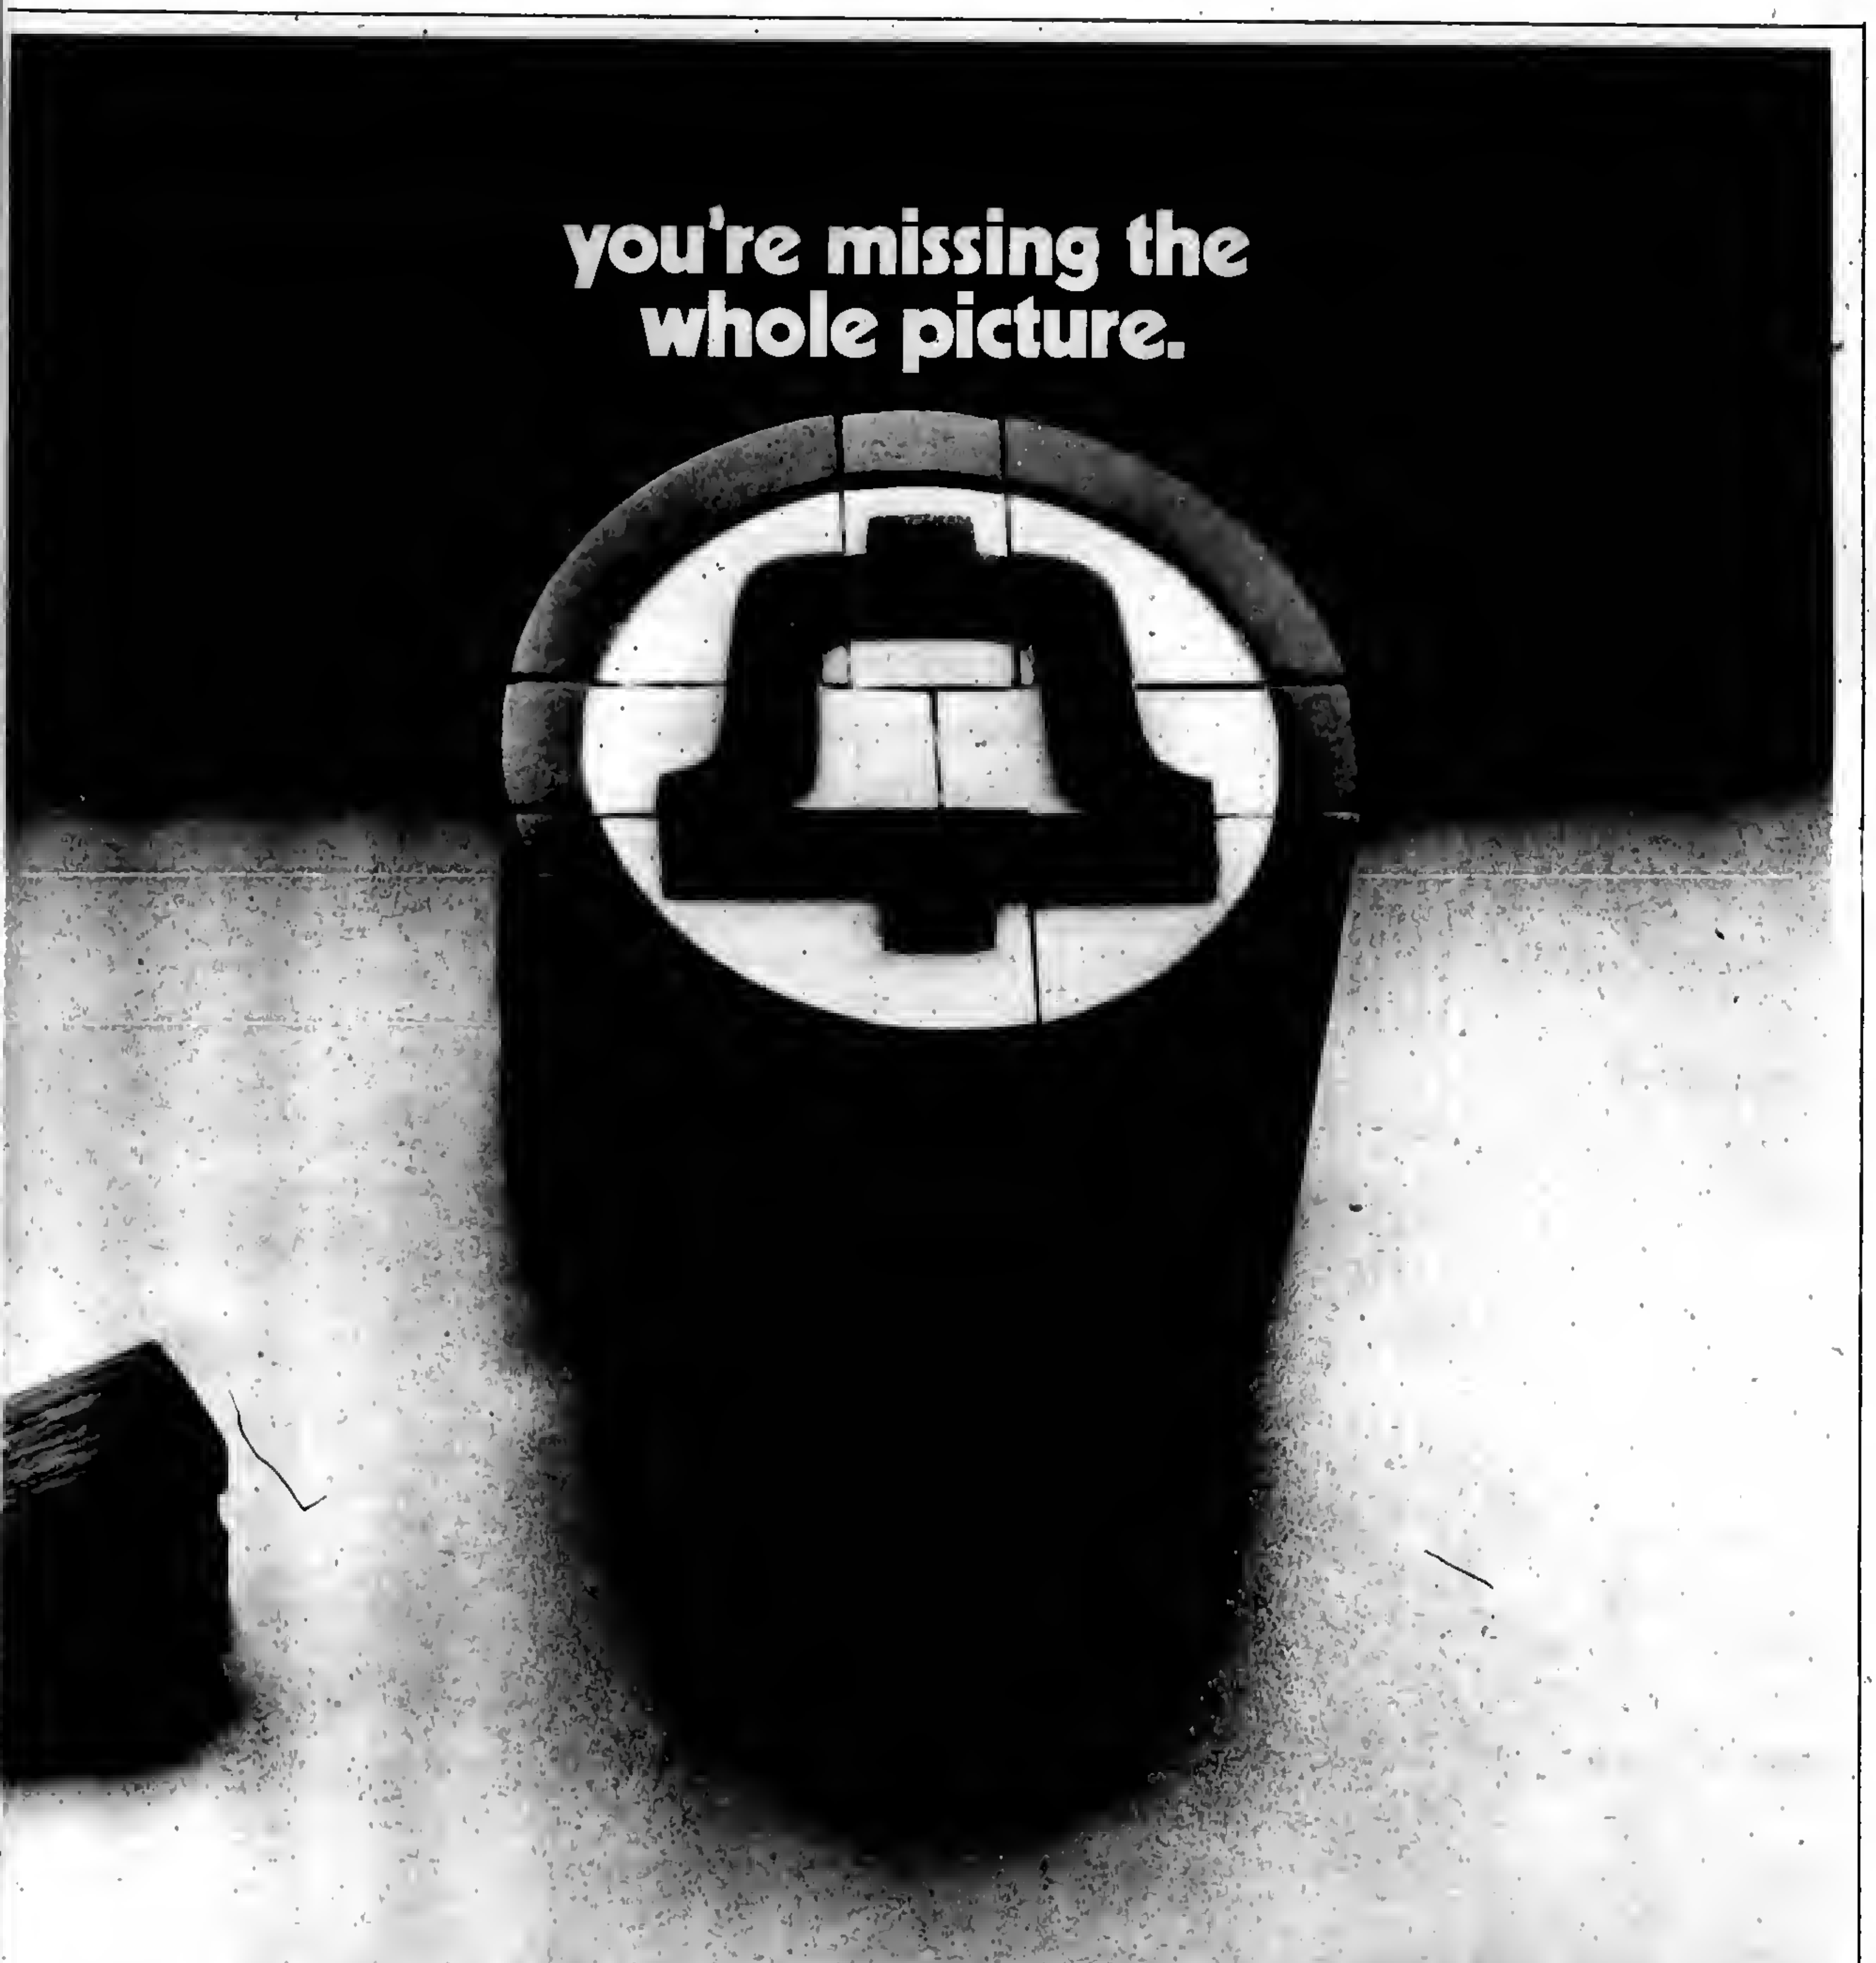
Vehicles on File

The motor vehicle registration file contains the name and address of the vehicle owner, vehicle type, model, serial number and current registration information. Vehicles can be traced through inquiry by either registration number or identification number.

The drivers' license file contains information recorded on the individual's license: license number, driving restrictions, name, date of birth, sex, weight, height and color of hair and eyes.

A real-time system for the re-

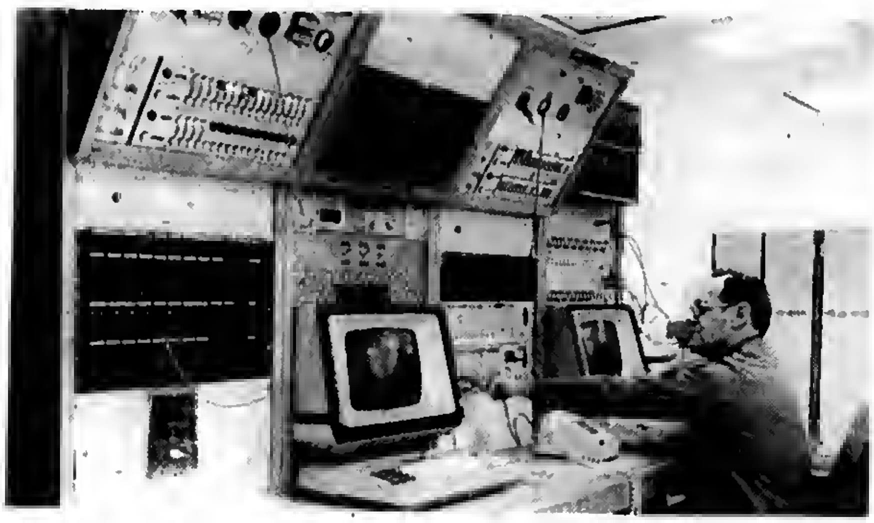
(Continued on Page S/22)



For we firmly believe that, in solving problems for companies like yours, the system is the solution. If you haven't talked systems with your local Bell Account Representative lately, you're missing something.

The system is the solution.

Bell System



Sergeant Robert L. Worman of the Ohio Highway Patrol operates control monitor which keeps track of data links into Univac 11--/422 multiprocessor system.

Highway Patrol, Motor Vehicle Bureau Rely on CRT-Based Enforcement Net

(Continued from Page S/21)

newal of drivers' licenses in Ohio became operational early in 1976. The new system considerably speeds the updating of information in the computer file.

Applicants renewing their licenses (valid for four years in Ohio) go as usual to the local office of the deputy registrar, the issuing authority in Ohio. Each deputy registrar office now has an Incoterm visual display, an "intelligent" terminal with 4,000 bytes of memory storage, linked to the 1100/42 system in Columbus.

Using the terminal, personnel can make a real-time check with the computer to ascertain that the person applying for license renewal is indeed qualified to drive and isn't under a suspension or revocation.

Previously, according to Donald Cort, assistant deputy director of the division of Computer Services, the license would probably have been renewed even though the person was ineligible because of the time lag in getting information into the centralized system.

Under the old system, Cort said, the information was entered into the computer under a batch program that could take a few days to process and it might be 30- to 60 days before the information from the centralized system could effect a cancellation of the previously issued license.

According to Jerry Hammett, deputy director of the Division of Computer Services, Leads has become a much finer system with substantial enhancements since it began operating under the new multiprocessor system.

More Reliable

Hammett said the system is faster, quieter and more reliable now. Most of the special software tailored for the state's needs, he explained, was developed by a joint Ohio State-Sperry Univac team.

A major advantage of installing a multiprocessor system, Hammett related, was that the state could dedicate a major portion of it to law enforcement without having to rely on an administrative system as backup because of the redundancy built into the 1100/42 system.

Hammett said plans are currently being formulated for additional use of the Columbus computer complex in law enforcement and criminal justice activities.

"We're looking into the possibility of using these computers for all law enforcement and criminal justice activities including the Bureau of Criminal Investigation, the Department of Corrections, Youth Commission and the State Supreme Court.

Exceeds Expectations

Summing up the results achieved so far from the system, William G. Christie, data systems administrator for the Department of Highway Safety, commented that the system "is doing more than anybody thought it would.

"It's been our goal for a long time," Christie asserted, "to put all of our records in a common data base and we feel that we've made a good deal of progress down that road."

Looking to the future, Christie plans on adding a real-time motor vehicle registration file to the computer's workload. This would be a system using intelligent terminals for on-line registrations. An obvious benefit would be the timeliness of data being updated. This data would then be the heart of a fiscal accounting, inventory and revenue distribution system for Ohio's 1,157 local taxing districts.

"Ohio has a record," concluded Robert M. Chiaramonte, director of the Ohio Department of Highway Safety, "of being one of the most cost-effective state governments and we're doing everything we can to maintain that reputation by running all of the operations under Highway Safety as efficiently and economically as we can. We believe that computers can play a major role in many of these operations."

'Do-It-Yourself' Units

Stanford University Sends Homemade Terminals Home

STANFORD, Calif, — Stanford University is getting into the swing of the new home computer boom by providing "build-it-yourself" computer terminals to 50 DP employees and 50 students to use at home.

The terminals give the students and DP personnel access to the school's computer system from the convenience of their homes, offices or classrooms. Moreover, the students and employees assembled the video display terminals themselves from the hobby kits.

The university recently purchased the do-it-yourself ADM-3 Dumb Terminal kits produced by the Data Products Group of the Lear Siegler, Inc. Electronic Instrumentation Division as part of two separate projects to provide additional low-cost I/O devices for the university's computer communications network.

One obvious benefit of the homemade terminals is that they save both groups from running down to the computer center to get their computing work run any time they have jobs to do.

Employees of Stanford's Center for Information Processing (Scip) and students in a special program designated Low Overhead Timesharing Services (Lots) assembled the terminals using only basic tools such as soldering irons, needle-nose pliers, wire cutters and screwdrivers.

The Dumb Terminals — CRTs with keyboards that let users enter data for processing — are so-called because they function simply like "quiet" teletypewriters.

For use at home, Stanford employees needed a compact, lightweight terminal. The Dumb Terminal fit the bill at only 25 pounds. The terminal is 12.5 in. high by 15.5 in. wide by 19 in. deep yet provides a 12-in. screen, measured diagonally. Power consumption for the terminal is 70W.

Time Savings

An economical answer to the university's terminal needs, the kits also represent a savings in waiting and traveling time by allowing employees to work at home. Some 50 participating Scip employees now have kits permanently assigned to their homes, enabling them to access Stanford's interactive systems any hour of the day or night, without ever stepping outside their front door.

"Having a terminal at home has given me the freedom to work my own hours, which are often late at night and weekends," Richard Guertin, one of the participating employees, said.

"I not only save the gas and time previously spent in extra commuting during predeadline periods, but get my work done faster by avoiding the university's usual interruptions. By working nonstandard hours, I can also avoid the daily traffic jam of programmers awaiting access to the computer," Guertin said.

Stanford University programmers can also utilize computers at other universities for special projects. Prior to home terminal arrangements, programmers needing to communicate with the computer center at the University of Michigan, for instance, were forced to arrive on campus hours earlier than usual to compensate for the time zone difference.

User convenience is only part of the home terminals' benefits.

Quick Repairs

Program breakdowns occurring after regular working hours can now be corrected in minutes, because the programmer doesn't have to drive anywhere. Immediate input to computer programs is particularly beneficial to employees working with the Stanford University Hospital, where quick repairs can often be crucial to the hospital's operation.

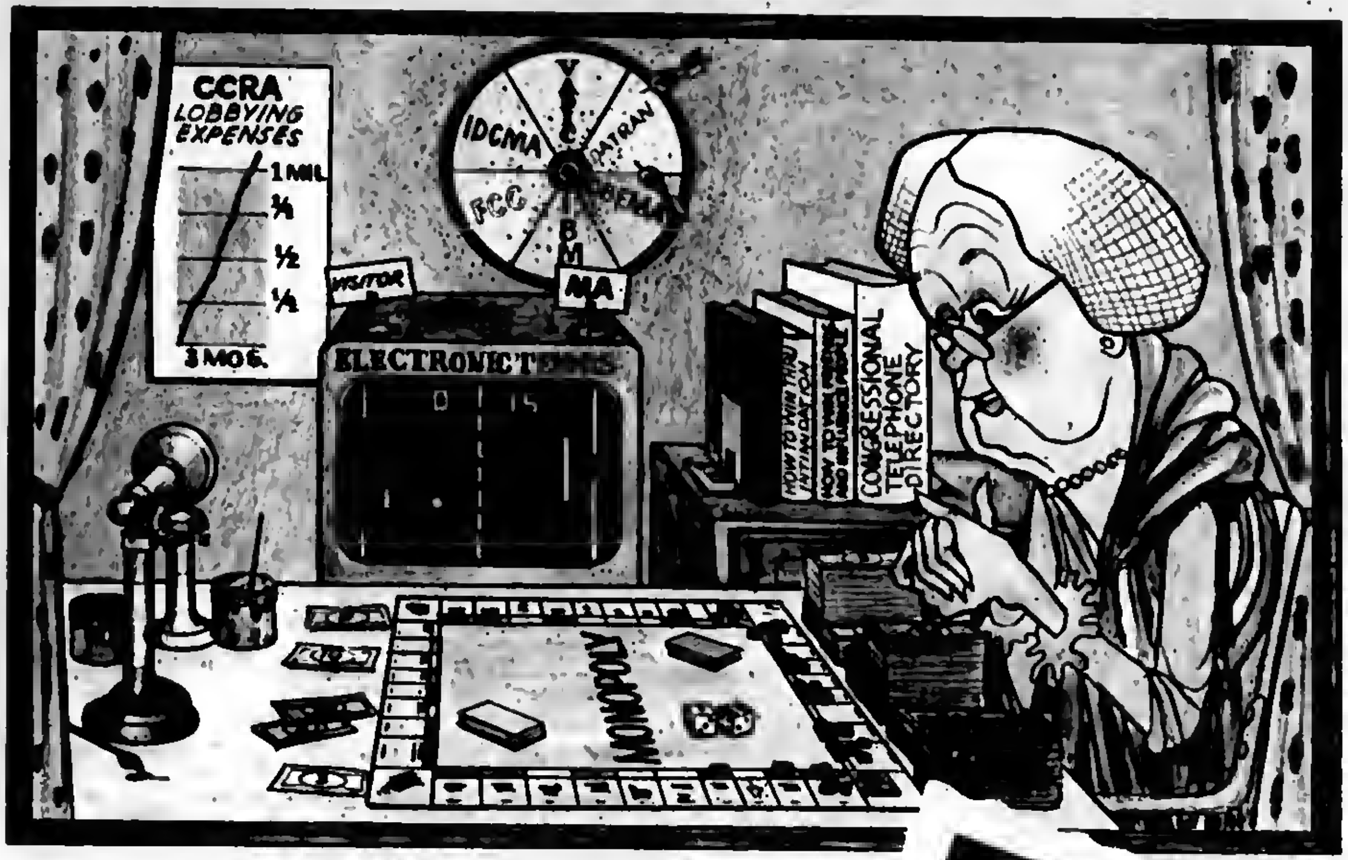
The terminals are connected to the computer center's IBM 370/168 which is also used by Stanford students and researchers.

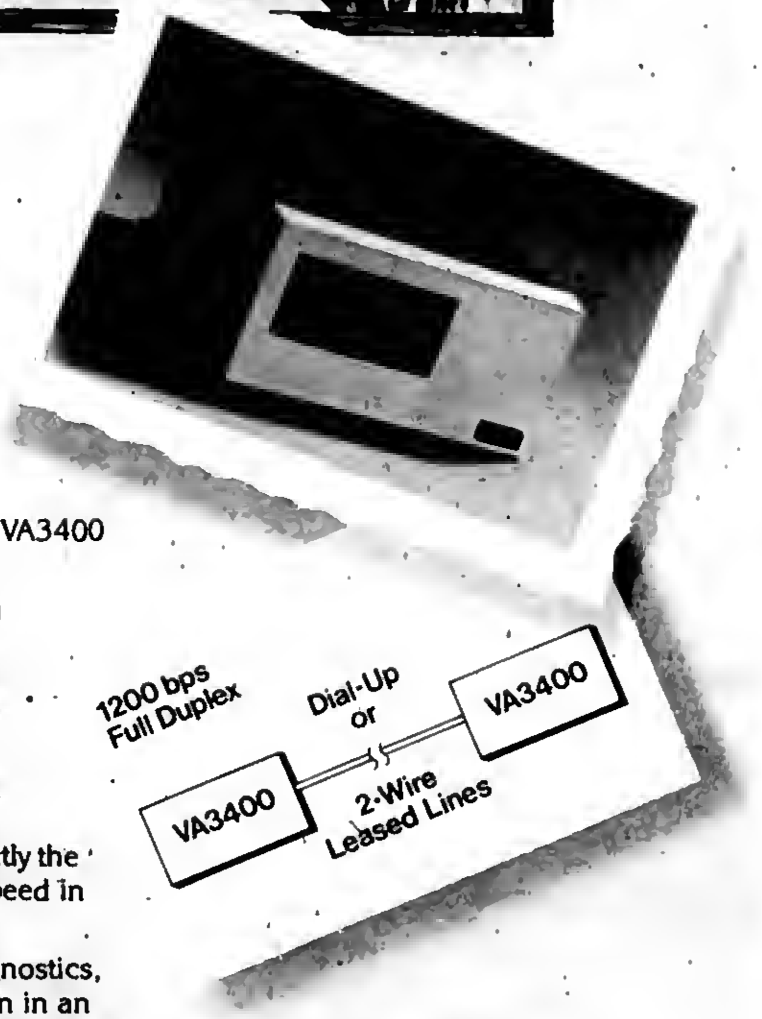
Lots, the second porchase program, was established by Stanford to provide students with additional facilities for 24-hour cost-effective interactive computing capabilities, using a Digital Equipment Corp. System 20/40.

"Lots was able to supply students with 50% more terminals by choosing the lower priced Dumb Terminal kits over fully assembled models with the same features. The kits were all assembled by students, who are also planning to take on maintenance functions for the 50 terminals," Ralph Gorin, manager of Lots, said.

Lots is open all the time and imposes no time or subject limits on student usage. Previously, students had accounts with dollar equivalents; when the money was gone so were rights to the computer. Students were also restricted to specific course work.

Plans are now being made to install a few terminals in the student dorms so they can also have the opportunity to "work at home."





Dear Ma:

While you've been playing games, Vadic has shipped over ten thousand 1200 bps full-duplex 2-wire modems.

Did you know, Ma, that Vadic has delivered over ten thousand VA3400 modems?

That's right, Ma. To more than 1,000 different customers. You see, Vadic was able to invent a full duplex 1200 bps modem that operates beautifully on either dial-up or 2-wire leased lines because they're modem specialists. And Ma, they did this almost four years ago!

With Vadic's VA3400, any 120 cps terminal can operate at full speed. Users no longer have to plod along at 300 bps or live with inefficient half-duplex operation. And since Vadic's VA3400 uses exactly the same line discipline as your 103, they can change computer port speed in just minutes.

These field proven VA3400's have powerful displays and diagnostics, too. Using them, operators can pinpoint just about any malfunction in an entire data network. More big news, Ma. General Electric now leases, installs and services Vadic modems at over 50 locations nationwide. And Vadic backs them up with five regional on-line diagnostic centers.

When it comes to Industry "firsts", Ma, Vadic sure hasn't been playing games.

Your independent thinking son,

Alexander Graham Jr.

PS: Vadic has shipped over 125,000 modems to date.

Modular Data System Helps Hospital Treat Its Ills . . .

BROOKLYN, N.Y. — When administrators at Maimonides Medical Center here began looking for a way to upgrade the center's computer system to reduce the workload, time and costs associated with patient admissions and reservations, the first place they looked was to their present computer system. Specifically, how could the DP staff improve the efficiency of the Burroughs B-2700, the heart of the system.

The need for centralization of all records was immediately evident as the first step toward achieving these goals. Ideally, the final system configuration would permit terminal access to the entire realm of patient information: medical, sociological and financial. While the sociological and medical portions of a patient's record initially would be accessed only in certain locations within the center, ultimately medical records as well would be available from terminals at nurses' stations on patient care floors.

Data Network

The present on-line network includes a General Automation SP 16/65 with appropriately connected terminals which is constantly on-line to the Burroughs main computer to handle and control the center's unit-dose system. The laboratory is on-line via modems utilizing a variety of terminal devices also permitting access to patient results at selected points in the medical center. In developing the data network, it was understood that certain existing systems would be blended and others integrated, based upon upgrade potential and the systems life expectancy, plus cost justification.

At the time, the center's primary data collection of patient admissions, transfer, discharge and expirations consisted of a direct connect line from the main computer connected to four vintage video display terminals which were considered underfeatured and inefficient. They had served a valuable purpose and for that period of time in which they were in use, they helped to do a fine job. But as evolution took place and other systems were implemented, such as laboratories, pharmacy unit-dose and enhanced financial reporting, the system and the people just could not keep pace with demands for a faster, more reliable media.

In order to speed up the information exchange and satisfy projected requirements, it was determined that two objectives be accomplished: develop a modular system with a total patient data base structure in mind and keep it human-engineered, which would lend itself to a low learning curve: and select a suitable video display terminal, which would lend itself to a conversation real-time mode, hopefully with Burroughs protocol for CPU compatibilty, competitively priced and full featured.

The first objective was a question of designing a new system, utilizing the power contained within the Burroughs MCP STO-Q and developing program modules which would effectively pass data through a designated STO-Q. The second objective was engaging in the selection of terminals that would do the job effectively, with the least amount of R&D, and maintain reliability. The terminals would be installed at appropriate stations throughout the hospital.

"The problem," according to John Harbison, director of systems & computer operations, "was that we had to find a microprogrammable video display terminal that would not only handle the information exchange between operator/computer/department, but would also be compatible with the Burroughs processor.

Selecting a Terminal

Four different manufacturers' video display terminals were evaluated for the system. "We eventually decided on the Delta Data Systems Corp. 4050B terminals, mainly because they could most easily fit into the center's existing system, in that not only protocol emulation for the Burroughs processor but also Burroughs terminal emulation is built in," Harbison said.

The Delta terminals at Maimonides are equipped with 2K characters of refresh memory and display 80 columns by 25 lines of upper- and lower-case characters. The display and editing features of the terminal were also considered, Harbision added, because of the many different forms the center's people use regularly.

In meeting the goals set forth in the first objective requirement, Maimonides developed a modular system and gave it the name Financial And Medical On-line Unified System (Famous), which officially went on-line at Maimonides on March 1, 1977. The delta video terminals and the Burroughs TC4000 printer form a critical part

All figures based on latest available Datapro survey.

Here's why our users rate DATACOM/DC so high:

"In terms of total satisfaction, DATACOM/DC measured up completely to what we wanted and gave us more than we expected."
—David Hughes, Manager of Systems and Programming, Mass. State Lottery.

"When we installed DATACOM/DC, we experienced a 30% increase in throughput; more important, we eliminated downtime."
—Gary Dyer, Data Processing Director, Blue Cross of Idaho.

"DATACOM/DC was extremely easy to install and we had no TP experience."
—David Harp, Director of Data Processing, New Castle County, Del.

"My programmers say DATACOM/DC is very easy to use; as simple as writing a COBOL program. The documentation also is very good. Technical enough for the technical people yet simple enough for management people to understand."
—Harvey Kennedy, Vice President and Director of Management Systems, Southern Baptist Annuity Board (Dallas).

"Vendor technical support is Insyte's largest shining star. The support people are unparalleled in the industry."
—Ben Driver, Data Base/Data Communications Software Manager, Brockman On-Line Systems (Houston).

Discover for yourself what our users already know—DATACOM/DC is the best TP Monitor on the market. Call or write us today.

. . . By Centralizing Records, And Terminal Access to Files

(Continued from Page S/24)

of this first module of the center's network.

The first modules of Famous to be implemented incorporate the admitting department and the financial investigator's office, comprehending on-line reservations, real-time admissions, discharges, transfers and on-line financial follow-up. Since the center maintains a very high occupancy, the time in processing patients is especially critical and must be accomplished swiftly and accurately.

Of the display terminals incorporated in the system, six are currently used in conjunction with one on-line printer with admitting procedures. Presently, there are three display terminals in the financial investigator's office for financial follow-up procedures and reservations, plus one terminal which serves as a backup.

Reservations are handled in the financial investigator's office for elective admissions, via the video terminals in that location. Standard admitting information, including all financial data, diagnosis/operation and tentative requested date of admission, are entered and available for recall at any time.

The system automatically assigns a reservation number which assists in maintaining orderly control. A special report is produced off-line each night providing a reservation register which also shows those patients to be called in for the following day.

The terminals in the financial investigator's office are also utilized to maintain up-to-date financial data on all patients including reservations and thus are always accessible for immediate terminal review.

The patient admissions interview is also handled via video display in a conversational mode, with information being collected and/or updated in real-time via the Burroughs mainframe. Naturally, it is accessible by display terminals in any of the respective areas by authorized users. Upon completion of the admissions interview via CRT, a full-form record of admission is printed via a Burroughs TC4000 terminal, also on-line to the mainframe.

Previously, a total of eight forms had to be filled out for an incoming patient by the admitting interviewer. A messenger then prepared an I.D. plate and bracelet for the patient, as well as additional forms and charts while the patient waited in a reception area. Admissions information was entered onto a display terminal on a time-permitted basis, usually more than an hour after the patient had been admitted.

Third-party notification forms were typed later in the financial department and there was no direct access from this department to admissions information which must be used to determine patient pay status.

Now all forms have been computerized and are either included with the full-form admission record set or are produced off-line at midnight to effectively utilize the systems capability.

Whereas patient information had previously been isolated in separate filing areas, it is now hrough together in one central patient file. The present patient profile, which includes information about reservations and admissions, insurance and other hospitalization coverage, has begun helping Maimonides personnel improve cash flow projections and monitor insurance payments more efficiently while cutting down greatly on routine paperwork, according to Donald C. Rizer, the center's director of financial management.

System Expandability

The capability to handle an almost unlimited number of real-time program modules is limited only to hardware limitations, since the software design ideally lends itself to a modular building block concept. The Famous system has proven itself since the first day of implementation wiht its simple adaptability by users, Rizer said.

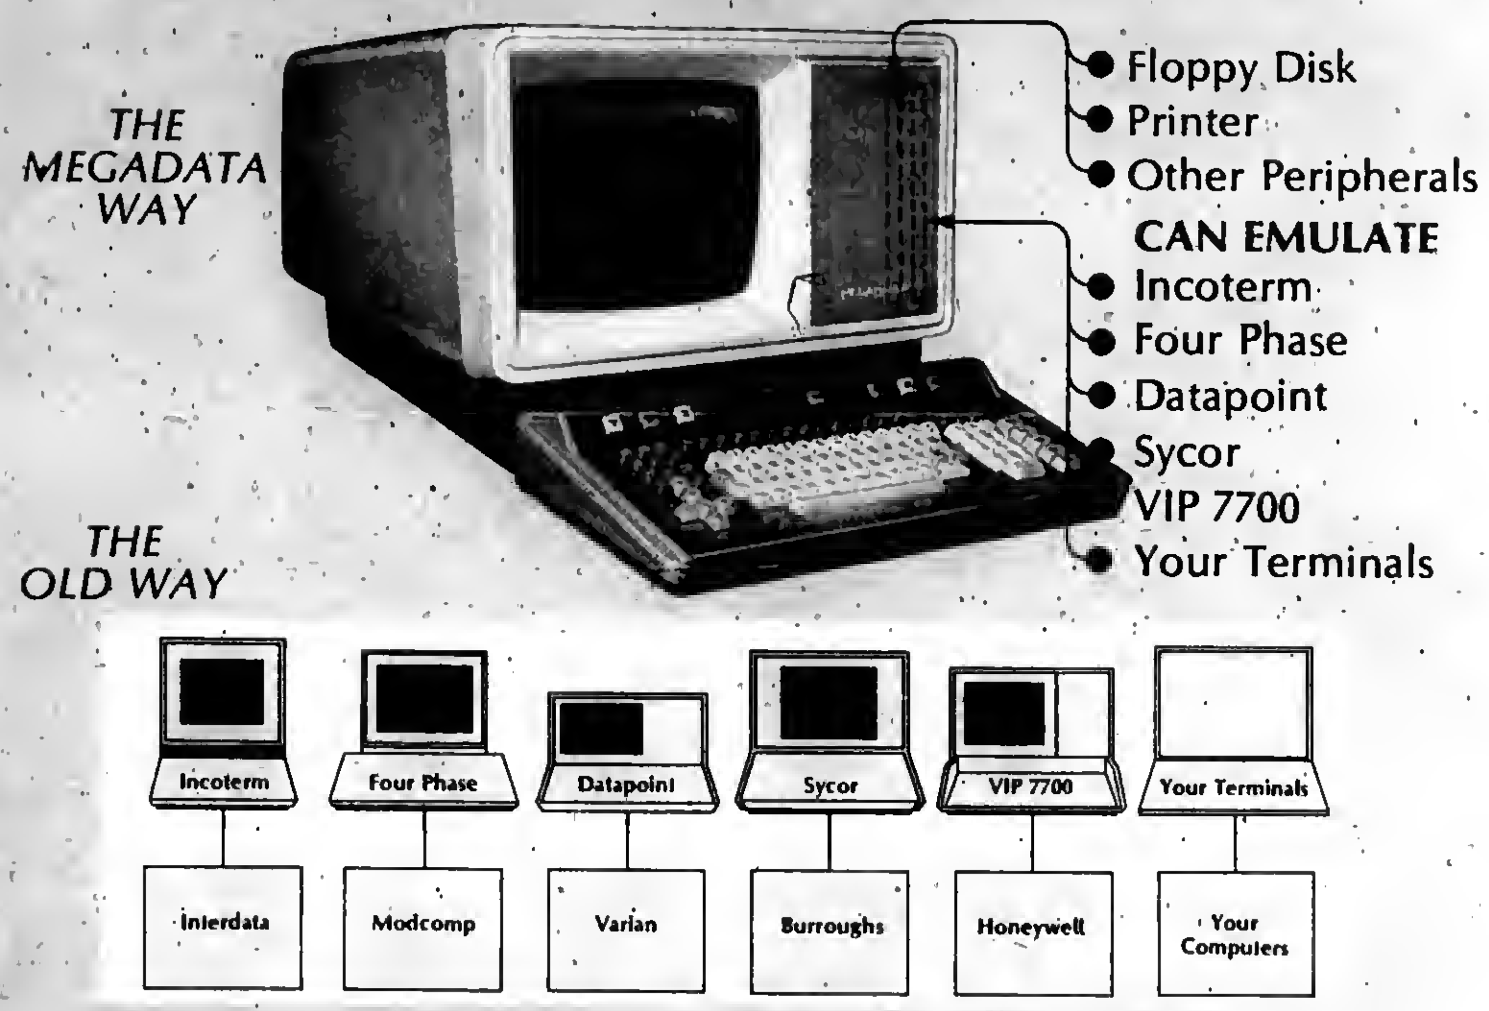
Since the center has had the pharmacy unit-dose and laboratory on-line, it was also necessary to integrate the information essential for an eventual total patient data base.

The next stage of expansion will take place in modules to handle the cashiers' functions, including special duty nursing and on-line demand bills; this development is currently under way and will be implemented by September 1. After this, development will continue through the medical areas such as radiology and a more comprehensive inclusion of laboratories and pharmacy.

Certain mainframe hardware upgrades are planned to provide the additional computer power necessary, including a front-end data concentrator with a 50kbit/sec channel to the mainframe; this is planned for the early part of 1978.

Eva Weill, admitting clerk, operates Delta Data Systems CRT to demonstrate on-line system at Maimonides Hospital.

MEGADATA's Model 700/UETS
Universal Emulating Terminal System



If you are a *multiple* computer user and your network includes many *different types* of terminals, the new and powerful MEGADATA UETS system is your key to vastly improved system utilization and operations....A SINGLE UETS terminal can interface with a multitude of host computers, and it emulates any number of different terminal devices. It thus provides very significant advantages to the user.

- *APPLICATIONS ORIENTED*—readily configured for your specific application
- *VAST REDUCTION IN EQUIPMENT*—a SINGLE UETS can replace any number of different types of terminals
- *UNIFORM OPERATING PROCEDURE*—ONE basic operating procedure on ONE machine; no changing from unit-to-unit and procedure-to-procedure
- *REDUCED MAINTENANCE COMPLEXITY*—ONE serviceman from ONE company, with all spares supplied by ONE source

To provide all the required interfaces and emulations, the UETS has been developed as a most powerful piece of hardware. It contains a 12-bit MPU, a 15-inch diagonal display, a memory up to 73 K, and a 126-station keyboard with up to 71 function keys.

To find out more about our UNIVERSAL EMULATING system and the many other applications oriented MEGADATA terminals, call or write *TODAY*.

Retail Store Scanners Analyze Sales, Cash Flow

MINNEAPOLIS — "Standing still is going hackwards."

That was Sherm Quisberg's comment when asked why he had installed front-end terminals in one of his four Super Valu Stores located here in St. Paul.

"I started getting an exposure to the concept of front-end terminal systems almost five years ago at the Supermarket Institute, but at that time that is all it was — a concept. Yet the potential seemed enormous."

Quisberg, as owner and president of four stores, had his hands full coping with the realities of running his business day-by-day, being competitive and keeping a stable bottom line. There wasn't the time necessary to conduct a meaningful feasibility study of front-end terminal equipment, evaluate their individual merits or determine which (if any) was right for his stores.

He was quick to point out that he relies on the many services provided by Super Valu and it seemed a logical place to elicit research support.

Super Valu had, more than two years previously, initiated an in-depth study of front-end terminal systems under the direction of Paul J. van Helden, senior vice-president of corporate planning and information systems. The purpose of the study was to allow the management of over 1,600 Super Valu Stores to make more informed judgments when considering upgrading to more sophisticated checkout systems.

"I didn't want to revolutionize my checkout systems overnight, but I did want to start with my present system's capability as a low-end starting base," he said.

"I was fortunate," Quisberg added, "to have a man like Al Jensen as store manager of our inner city Minnehaha Mall store, the site of our first installation. He had both an electronics and training background in addition to his retailing management qualifications, having been with Honeywell's Commercial Division as assistant training manager. With the experience we've both gained, my other managers will be ready for electronic front-end systems when their turns come."

Although Super Valu had not yet completed its formal study, it was "leaning" toward the Sperry Univac Accuscan on the basis of numerous critical criteria including system capabilities, upgradability, flexibility, price and a committment to continue to serve the retail community.

Quisberg indicated he had virtually decided to acquire another manufacturer's equipment at that point, but decided to make time to evaluate Accuscan.

It was in August 1976 that Quisberg installed an Accuscan system. At a later date, Super Valu gave its formal endorsement to Accuscan.

Advance Training

Training of all store management and checker personnel was conducted in-store well in advance of the cutover.

"Our approach to checker training," Jensen said, "was to have our head cashier, Elaine Marchand, along with Univac's Carlene Thissen, conduct the training as a two-part team and it worked beautifully. We sought checkers that we felt had good attitude and personality, plus a high degree of manual dexterity, because we felt these characteristics were paramount to do a superior job with our new system.

Jensen said the result was a fast learning situation in a friendly, yet competitive environment. "Looking back, one essential ingredient which we feel was critical was having a vendor-specialist on-hand during the entire learning process. The other was having one of our own people as part of the teaching team. Our people knew her and could relate to her direction."

The Accuscan system installed at the Minnehaha Mall store includes:

- Dual control centers with dual computers and dual disks (96 tracks, 491K bytes). This allows full "redundancy," that is, the ability for one system to take over should the other fail. These data retention features provide virtual fail-safe protection for all sales data.
- Nine front-end terminals with alphanumeric customer displays plus cash and utility drawers.
- One office terminal.

The system has the ability to provide total sales analysis for up to nine departments.

Increased Productivity

"I know," Quisberg stated, "that our productivity has increased, but I haven't taken the time to conduct a formal study. More important to us is that we can get sales breakouts with a push of a button for up to nine departments, can determine, automatically, the number of people (and on a percentage basis) shopping by department, minute-by-minute and we know what's being bought and how much without taking a physical inventory. These capabilities were not possible with our previous system."

Quisberg has four stores in the Twin Cities with total gross receipts in excess of $25 million. His ambition is to have 10 to 12 stores within the next 10 years.

Electronic terminals are one way he hopes to cope with anticipated growth, through their ability to help control cash and maintain a more accurate and faster accounting system.

Bad Checks Caught

"Our Accuscan system," he said, "will not cause any reduction in staff. What it will do is increase the capabilities of what our people can accomplish and add to the scope of their contribution. For example, in one day we saved over $250 by detecting bad checks. This was possible through the combination of electronics and a special verification program in Accuscan that scans for previous bad check experience. You have to ring up a lot of sales to recover $250."

Quisberg plans to utilize further applications capabilities inherent in the present hardware and Alpha 3 program package, but wants to move at a rate that can be readily assimilated within his stores's overall system and accounting procedures.

In addition to the existing Alpha 3 program package, Sperry Univac has indicated plans to make available, later this year, supplementary function capabilities in what it will call Accuscan Alpha 4.

Quisberg anticipates using full scanning sometime in the future, but doesn't see the necessity right now.

B500

Intelligent Terminal
Expandable Memory

Beehive International's B500, an 8080A microprocessor based video display terminal, offers excellent system flexibility and an unmatched cost/benefit ratio. Features include an expandable program memory, data transmission to 19,200 bps, and Full Duplex/Half Duplex on-line operation. Other features: edit functions, RS232C compatibility, format mode, two pages of 25 lines by 80 character display memory, block transmission, addressable cursor, upper and lower case characters, scrolling, and eight video levels. Beehive's B500 also utilizes a detachable typewriter style keyboard with an 11-key numeric pad.

Many options are available to meet exacting customer requirements. Keystroke programming and download capability from an external data source are available with the extra RAM memory option. Other options include 256 programmable characters, programmable keyboard, output printer port and an auxiliary I/O port with either serial or parallel interface option.

BEEHIVE'S
B500
features

- Expandable Memory
  Display: 4K RAM (4,000 characters)
  Program: Up to 4K PROM or 7K ROM
  Up to 48K RAM
- User Defined Function Keys

IBM USERS:

PUT YOUR 3270s IN LOCAL MODE UNDER SDLC AT UP TO 56KB WITHOUT VTAM OR NCP.

PIX-II is the industry's first virtual data link. That means it performs all of the functions of an SDLC network, but with none of the actual hardware or software required by IBM.

By removing all of the complexities between the byte multiplexer channel of your host CPU and the remote devices it communicates with, PIX-II makes those devices appear to the CPU to be in local mode.

Stop for a minute and think about what that means to your current and future plans for using 3270-type data entry devices. It means seven benefits that would otherwise be unobtainable anywhere.

First, it means you can build a 3270 network virtually overnight, regardless of your current processor model or software system, and without any front-end hardware or software. A PIX-II local controller installs on you CPU's byte multiplexer channel, taking the place of a 3272 local controller. A PIX-II remote controller installs at each remote site, with a 3272 local controller. The 3271 remote controller is eliminated. The installation takes a day, requires no software modification, and gives you—immediately—a completely operational 3270 network.

Second, that installation now puts all of your 3277-type terminals in local mode, as if they were right at your host CPU site, attached to a byte MUX channel.

Third, now that your CRT stations are in local mode, polling is totally eliminated. Every 3277 is served on a demand basis, as if it were the only terminal on the network. Nor is there any need for polling software overhead. You don't need it.

Fourth, the result of this systems configuration is improved response time for every 3277, regardless of its location. On average, that improvement will be about four times better than what you now achieve: from an average of eight seconds, to just under two seconds. For *every* 3277, consistently.

Fifth, no remote terminal access software is needed. None. No remote BTAM or remote TCAM if you operate under non-virtual methods. No VTAM and related NCP front-end software (there is no front-end) if you operate under virtual technology. That feature alone saves you months of effort.

Sixth, whether you operate under bisynch or SDLC now, PIX-II immediately gives you all of the benefits and speed potentials of SDLC, with no development work required. None. The PIX-II data link operates at speeds up to 56KB, so all you have to do is specify the type and speed of communications link—from a 1200 baud leased line to a 56KB satellite link. PIX-II takes it from there.

Seventh, putting up an instant 3270 network is just the beginnings of what you can do with PIX-II. Once it's installed, you can attach remote peripherals, HASP or JES work stations, console controllers, and even use it to develop a true CPU-to-CPU link without ACF.

You'll also like the price. PIX-II costs less than the equipment it replaces—far less in some cases. Its greatest virtue, however, is that it lets you do right now what you'd like to do right now—with virtually no effort required.

Find out more about PIX-II. Send us the coupon or call our nearest sales office.

PIX-II: the beginning of tomorrow's 3270 networks.

With Help of Terminal System

Sporting Goods Wholesaler Scores Profit Records

COSTA MESA, Calif. — A Southern California sporting goods wholesaler is running up a scoring record for itself in the profits column as a result of upgrading its DP facilities.

Munson Sporting Goods, which operates in seven Western states, expects the move from a minicomputer to a larger capacity on-line terminal-based system will improve annual net profits by an amount approaching six figures. The secret is improved inventory control of the 13,000 items the company stocks.

"It's simply a matter of having sufficient computing power to determine what to stock and in what quantities," according to Ken Roberts, Munson's controller, DP manager and chief architect of the new system.

"A year ago, our sales were slightly above $16 million, but we experienced more than $1 million in 'zeros' (a trade expression for customer-ordered items that are out of stock). Since back orders are practically nonexistent in our industry, an out-of-stock item usually means a lost sale. Now our annual zeros are half that rate and falling," Roberts noted.

The new terminal-based system, a Hewlett-Packard 3000 small computer, has also helped Munson reduce by 20% its total investment in inventory despite an expected increase in sales volume during the year.

Moreover, the HP system is helping Munson meet its objective of shipping customer orders within 24 hours after the order is received. According to Roberts, this service to its 2,300 customers is extremely important to maintaining customer goodwill.

Two operators at Munson use HP 2640 display terminals to enter order data from either customer phone calls or courier-delivered orders for Munson's line of hunting, fishing, camping, athletic and marine products.

To produce immediate response to customer requirements, Munson's 30 field salesmen are being equipped with Azurdata portable terminals.

"A salesman can transmit a day's orders to our computer in about three minutes," Roberts said. Salesmen are also given weekly microfiche inventory levels to help them speed the order planning and transmittal process.

"Our salesmen appreciate being relieved of paper shuffling. And our fast response is proving a formidable sales tool for them," he added.

As orders are received, inventories are automatically adjusted. Thus Munson's four service people, who have access to terminals, can respond instantly to salesmen or customer requests with accurate inventory information.

Packing slips, with items listed in the most efficient order for warehouse picking, are automatic byproducts of order entry, Roberts said. Once stock is picked, a duplicate of the packing slip is routed back to the DP center. It then serves as a source document for data update via a terminal to signal the HP3000 that an order is being shipped and to prepare an invoice.

Further HP 3000 byproducts are sales analyses, commission reports, acounts receivable aging and general ledger accounting.

Munson's system provides extensive support for purchasing functions, Roberts indicated. Purchase requests are automatically generated for new stock at the most economical quantities. Reordering is timed by the computer to mesh with the seasonal nature of sporting goods. Using the HP 2640 terminals, purchasing personnel may retrieve instantly a 12-month forecast of sales by item either in tabular or graphic format, he said.

Munson Sporting Goods Controller Ken Roberts uses the HP-2640 terminal to run budget and financial forecasts on the company's HP-3000 computer.

Munson's six HP 2640 CRT terminals are located throughout the company's combined general offices and warehouses here. The terminal can present up to 1,920 characters on its screen in a 24-line by 80-column format and it allows users to edit or modify data off-line before transmission to the processor.

In addition, eight special function keys may be user-defined to initiate routines such as forms entry or on-line error detection.

One of the HP 2640s in Munson's accounting department serves as an on-line entry station for inventory receipts, cash or check application and accounts payable entries. Still another terminal is reserved exclusively for program development.

Most of Munson's programs are written in Basic, some in Cobol, Fortran and RPG. Image/Query, the HP 3000's data base management system, serves as Munson's data base manager and allows on-line inquiry and entry using simple and logical English statements, Roberts said.

As Munson's controller, Roberts is one of the firm's most ardent on-line users of its HP 3000. His personal terminal is used for financial analysis and budget forecasting. Budgets customarily are established a year in advance by month by department.

As the year evolves, an actual item may differ from its budgeted amount, e.g., sales in particular month substantially in excess of the amount predicted. The budgeting program will then dynamically factor this excess into other related accounts, e.g., purchases, commissions and profits, and the adjustments will be incorporated into budgets for the remainder of the year, he explained.

WHY BUY A HALF-WITTED INTELLIGENT TERMINAL?

MAKE YOUR PRESENT ASCII TERMINAL PART OF A SUPER INTELLIGENT COMPUTING SYSTEM FOR $6100* OR LESS WITH A DTC MICROFILE AND EXTENDED BASIC

*THAT'S THE SINGLE UNIT PRICE FOR MODEL MK IIA INCLUDING THE EXTENDED BASIC INTERPRETER, 24K OF RAM, AND 600K OF FLOPPY DISK STORAGE.
OTHER CONFIGURATION, QUANTITY, AND OEM PRICES ON REQUEST.

Compact and easy to use, the field-proven DTC MICROFILE computer system gives you capability without complexity.

DTC's versatile extended BASIC interpreter has full Sequential and Random access file features.

The MICROFILE's two EIA RS-232 ports interface with one terminal and a host system or with two terminals in a stand alone system.

Data rates of 110 to 9600 Baud, line and terminal interface independently set; Bell 103/113 and 212 compatible.

The MICROFILE comes with one (Model MK IIA) or two (MK IV) dual-floppy disk drives for up to 1.2M characters of on line storage (each disk holds 300K characters), plus up to 56K of RAM (8K standard).

Only large mainframes can match the MICROFILE's standard text editing and optional document processing power.

Among the many word processing features are mailing list maintenance and an automatic letterwriter which personalizes documents by merging mailing list data and text.

Users Seen Interested in Applications, Not Hardware

By John A. Hill
Special to Computerworld

There is a multitude of manufacturers of intelligent terminals. To succeed in today's marketplace, the manufacturer must have the ability to enhance a client's specific application to the point where the client no longer looks simply at the cost of the terminal but also considers the overall cost savings that can be achieved with a particular terminal.

In today's applications-oriented environment, customers are no longer just interested in hardware, instead, they want to know how a manufacturer can improve their overall operation from the standpoint of total cost savings, efficient utilization of personnel and prevention of premature hardware obsolescence.

In intelligent terminals there are basically two types of customers: DP managers and communications managers who have a good understanding of what they want to accomplish; and customers who have no knowledge of computers, DP or communictions but know their application in depth.

Those who have little or no technical knowledge look to the manufacturer for ideas and suggestions that will best meet their needs.

However, these customers usually have definite ideas about the type of display, clearness of character set, size of characters, keyboard layout, placement of special function keys, cursor movements, key colors, etc. These people are frequently more concerned with aesthetics than with actual operation, but the vendor still must be able to accommodate their wishes and desires.

For example, a terminal vendor must be ready to modify the keyboard to make it easy to operate. You may consider this an insignificant task, but to the customer it may be of paramount importance.

More Sophistication

As a whole, however, the users of intelligent terminals are becoming more and more sophisticated.

When buying a terminal they no longer just look at purchase price; instead, they consider the overall cost savings that can be achieved with a particular terminal.

A company making a substantial investment in hardware wants to ensure that the equipment does not become obsolete tomorrow but that, by simply reprogramming the terminal, the same piece of equipment can be used for many new applications.

Thus, hardware cost is no longer the key to the intelligent terminal marketplace. The real thrust is being able to evaluate a prospective customer's requirements, not only to meet his immediate needs but also to anticipate future growth where savings could be realized over a longer period of time.

Before committing themselves, prospective terminal users now analyze such things as operator intervention, speed of response, error checking capabilities and communications costs. In other words, they need to know the cost of operators, throughput, communications and other items where costs have risen at a yearly rate of 10% to 20% over the last five years.

Many companies use several different computer systems and are thus faced with operating and maintaining a mix of vendor equipment. To simplify their operations, they are now looking for hardware that can be configured to operate with different types of major computers, can handle different protocols and can be reprogrammed to handle new applications.

Ideally, a user would like to concern himself with only one vendor, one type of terminal, one service organization, one set of spares and one set of operating instructions. To satisfy these requirements, a single terminal must now be able to satisfy several different protocols. The Megadata 700/UETS (Universal Emulating Terminal System) is an example of such a terminal.

Intelligent terminal manufacturers are finding it increasingly more difficult to sell a standard terminal configuration. Most customers want a keyboard, color scheme and other features that are tailored specifically to their operation.

They are looking for a supplier who can discuss applications and come up with ideas and suggestions for improving operations. The vendor must provide improvements for specific tasks and, most of all, must furnish a terminal that can relieve the mainframe computer of many mundane and routine tasks. A customer also wants to be sure that a terminal buy will not force him to change his overall method of operation and his present host computer configuration.

Recent advances in technology and especially integrated circuits will make it possible in the near future to build an intelligent terminal with as few as five to 10 integrated circuits.

This opens a whole host of new applications and markets for the terminal manufacturer.

Who is to say, for example, that every home owner could not be a prime candidate for the purchase of an intelligent terminal system to keep track of his monthly billing, checking account, energy consumption or meal planning, etc.?

John A. Hill is vice-president of sales and director of marketing of Megadata Corp., Bohemia, N.Y.

Can your Uniscope debug itself?
Our Harris 8210 can.

Our Harris* 8210 terminal emulates your Univac** Uniscope® at a very reasonable price. It also does things your Uniscope never dreamed of.

Like what? Like debugging. Instant problem diagnosis. Improving operator compatibility.

For instance, Harris terminals will let you pinpoint transmission problems between terminal and host computer.

Let you immediately display event codes describing line activities.

Let you make hard copy records to document intermittent problems.

Let you detect faulty network components, incorrect addressing, text inaccuracies.

Let you instantly diagnose any operational problem from text errors to addressing inaccuracies.

And Harris terminals are lightweight, compact. No glare, no heat, no noise. Result? Life's a lot pleasanter—and more productive—for your operators.

Service? Terminals are our only product. Naturally our service is good and fast.

Harris terminals. They could stop what's bugging you. Call or phone for details and a demonstration. Harris Corporation, Data Communications Division, Daniel Webster Highway South, Nashua, NH 03060. 603-885-6685.

For 63 Terminals in Eastern U.S.

CRT Terminals, Not CBs, Mark This Modern Trucker

CHERRYVILLE, N.C. — If you're a modern trucker, you've got more than CBs these days. You've got CRTs — at least if you're Carolina Freight Carriers Corp.

The $123 million trucking firm has 150 Honeywell VIP 7700 CRTs at its headquarters here and at 63 freight terminals in the Eastern U.S. More than 110 of them are configured with receive-only printers.

"When we began our first application in April 1974 — administrative message switching — we removed telephone equipment that was costing us $12,000 a month and stopped using a slow-speed teleprinter service that was costing another $12,000 a month," according to J.M. Froneberger Jr., the company's assistant secretary and assistant vice-president in charge of data services.

"That, of course, didn't cover the entire cost of leasing the CRTs and data circuits, but they did provide us with other longer term economies. We can keep better track of our equipment and shipments now and give better customer service," he said.

Initially the company installed 80 CRTs and 70 printers. The other terminals were added gradually as the firm added new applications and opened new offices.

Communications Lines

The VIP 7700s communicate over three 4,800 bit/sec circuits and seven 2,400 bit/sec circuits (with from four to 18 devices per circuit) to a Honeywell Model 6040 large-scale computer that was upgraded last March to a Series 60 dual-processor Model 66/20. The three 4,800 bit/sec circuits are economical enough for local use — they are all within a one-mile radius of each other and in clusters, according to Froneberger. The company has recently added another five 2,400 bit/sec circuits for a total of 12 that are used for long-distance communications.

Each of the 63 freight terminals uses a CRT configuration that can range from a single VIP 7700 with printer at the smaller terminals to as many as five VIPs with printers at the larger terminals. Buffer sizes for the VIP 7700 and printer are 1,920 characters or one screen format. Each is separately addressable so a freight dispatcher can compose a message on the screen at the same time the printer is receiving a message.

The printers operate at 30 char./sec at the low-volume locations and 120 char./sec at higher volume sites. Usually one or two copies of a document are produced, but on freight bills one original and three copies are printed.

The system handles about 30,000 administrative-type messages and more than 35,000 transaction processing executive messages that update files each day. It runs around the clock, 365 days a year.

The remaining VIP 7700s and printers are located in the rating department, central dispatch control and other offices throughout headquarters such as sales, claims, revenoe. accounting, traffic and maintenance.

Carolina Freight added the second major on-line application to the system in March 1975. That was equipment, or dispatch, control that enabled the company to track tractors and trailers from trip origin to destination and to know within seconds if a shipment was in transit or if a trailer might be loading or unloading at either a terminal or a customer site, according to Froneberger.

Carolina Freight's Stoneham, Mass., operations manager John Willard uses a Honeywell VIP 7700 CRT to send information on trucks bound from the Boston area to the company's other freight terminals throughout the eastern U.S.

"It would also permit a dispatcher who needed special equipment, say a refrigerator trailer, to locate one immediately at the nearest terminal. Instant responses through the computer allow us to make firm commitments to customers on the first phone call and help us to be more competitive," he said.

On-line freight billing followed in September 1976. "That permitted us to get very close to oor business," he said. "We can now account for oor revenoe the next day after a driver receives a shipment instead of waiting ontil truck mail brings the papers to headquarters."

When a truck is loaded the driver brings the bill of lading to the loading freight terminal office where the shipping information is entered and transmitted to the company's general offices immediately.

Delivery copies also are transmitted to the destination freight terminal so when the long-haul driver arrives, freight can be onloaded, checked and transferred immediately to the firm's local trocks, whose loads already are planned, for delivery to customer sites.

"Besides letting us begin final delivery and billing procedores earlier, this application has improved procedures for handling costomer inquiries. We can identify any one of 100 or so shipments that might be on any particular trailer and provide immediate answers to questions," Froneberger said.

Rating Consolidated

Carolina Freight's next step was to consolidate the rating fonction at headquarters with the on-line system early this year. Prior to that the rate functions were performed at each freight terminal.

The 20 rating clerks at headqoarters call freight bill forms to their CRT screens, so the correct charges from the tariff books can be applied. The computer extends the charges and the invoices are ready to be printed in the next morning's batch run.

"Centralized rating made the process more efficient so we didn't have to add more people as work increased;"

In Nationwide Network

Concentrators Let Credit Firm Expand with Same CPU

ATLANTA — A network of programmable terminal systems, each with the ability to concentrate Teletype traffic, has enabled one of the nation's largest credit reporting agencies to expand its business steadily without upgrading its mainframe hardware.

Continued growth for Credit Bureau, Inc. (CBI) depended upon the number of Teletype terminals able to access its data base here containing pay history information on more than 40 million consumers.

Three years ago, that growth path looked uncertain. Although employment of time-division multiplexers had trimmed line charges between Atlanta and the 24 cities in which CBI maintained offices or sold services, the firm's operating system software placed limits on the number of devices its IBM 370/168 could address directly.

"We were operating our Teletype network under IBM's CICS, within a partition of OS/MVT," Randy Wewers, assistant vice-president of data processing at CBI, said. "With our multiplexing scheme, we had been able to attach approximately 1,000 Teletype terminals to our mainframe, but we found ourselves very close to the limits of our operating system."

Concentrators Chosen

One obvious if painful choice was able to attach additional Teletype terminals to a second mainframe. Instead, CBI chose to concentrate Teletype traffic through 24 PTS-100 programmable terminal systems from Raytheon Data Systems Co.

It was a logical decision to make for three reasons. The first was the cost of mainframe expansion. "We would have had to add at lease an IBM 370/168; more likely, another 168 — if we could have expanded our system at all, by going that route," Wewers explained.

Second, Raytheon provided a viable alternative for handling additional Teletype terminals because its PTS-100 systems were already in place, having been selected to replace IBM 3270 equipment at a cost saving of approximately 30%, he said.

"Third, Raytheon was the vendor that could do the job and we did look at others," Wewers added. "Teletype concentration was not a new concept. Raytheon had accomplished it earlier on its PTS-100 terminals emulating 2260 equipment. For us, they enhanced their 3270-compatible gear to do the same job, and, in the process, met some specific applications requirements we had relating to security procedures and the size of messages we had to handle."

The addition of a Teletype concentration capability to CBI's network not only allowed the credit reporting service to avoid adding additional mainframe processors, but also saved approximately 150K of core memory, freed roughly one-sixth of the capacity of its existing processor and eliminated several communications lines and a good deal of communications hardware, including nearly 150 communications adapters and numerous modems.

Since installation of the equipment began in mid-1974, CBI has more than doubled the number of slow-speed, low-cost Teletype terminals in place at retail stores, banks and other credit granting institutions in the markets CBI serves in the Eastern and Western U.S.

"The Raytheon systems have been a major factor in our ability to hold down the costs of the credit reporting services we provide," Wewers said, "and we expect that cost benefit will continue as our network continues to expand, almost daily."

Faster Responses Demanded

He explained that the trend toward automation in the credit granting industry began in the late 60s, sparked by the demand for faster responses to consumers applying for credit.

"Prior to that time, the pay history portion of the credit granting process had been handled manually. The credit granter would place a phone call to his local credit reporting agency. A clerk there would search a manual file, pull the record on the particular consumer, if such a record existed, and read that file over the phone," he said.

Wewers said the first wave of automation involved the installation of hard-copy de-

(Continued on Page S/33)

CRTs, Not Radios, Mark This Modern Trucking Company

(Continued from Page S/30)

Froneherger said. "It also increased accuracy in applying rates, since rate personnel specialize in handling tariffs between certain points.

A payroll reporting system for about 300 employees is already on-line. Hours worked are gathered from the terminals for the batch payroll system. Carolina plans to add the rest of the company's nearly 3,700 employees to the on-line portion of the system as well as other functions such as vacation or sick-leave accounting.

The terminals have improved the productivity of the company's DP department, according to Froneherger, since time-sharing provides a faster means of developing and modifying programs than the coding sheet, keypunch and run-when-you-can-get-the-time method.

The department consists of a director of DP, three systems/programming managers, six applications programmers, seven operators, one computer facilities manager and 28 others, including keypunch and document control clerks.

They currently are working on modifying other batch accounting and statistical programs for the on-line system. During the next two or three years they plan to modernize the accounts payable and accounts receivable programs; put the "over, short and damage" report on-line; and do further work in computerizing the tariff structure to allow the computer to do some automatic ratings.

Another on-line application Carolina hopes to add is a Zip Code delivery routing for local trucks. That would permit the freight terminal dispatchers to plan local deliveries even more precisely before the long-haul truck arrives.

WANG'S PCS-II
THE END OF THE LINE FOR INTELLIGENT TERMINALS.

Wang's PCS-II. The small business computer that makes intelligent terminals obsolete. And introduces a whole new world of Distributed Data Processing.

Endowed with commercial BASIC and exclusive Wang minidiskette storage, the PCS-II delivers direct access data processing capabilities no ordinary terminal can. And with Wang's programmerless "EASYFORM" forms building and data-entry language, the PCS-II is a hands-on winner in any data-entry or forms-processing environment.

Wang modularity lets you expand memory, communications or peripherals as your needs grow. Or new technologies as they develop. Directly at the operator-site.

The PCS-II even gives you a price tag no intelligent terminal can match — just $6,200. With 50K memory, dual minidiskette drives and bisynchronous 2780/3780 communications it's still only $9,200.

Hungry for more intelligence? Call your local Wang office or mail this coupon to PCS-II Product Sales, Dept. DDP, Wang Laboratories, Inc., One Industrial Ave., Lowell, Massachusetts 01851.

I'm hungry. Send me information on Wang's PCS-II

Concentrators Let Credit Firm Expand While Using Same CPU

(Continued from Page S/32)

vices, often IBM 2740-type terminals, at credit reporting agencies. "A phone call still initiated the inquiry, but the response was improved because the clerk at the credit bureau could key the inquiry instead of searching a paper file."

Video terminals at credit bureaus came next, with IBM 2260-type devices most popular. The next evolutionary step in the automation of pay history inquiries was elimination of the human "interface" between the credit granter and the reporting agency's data files. Banks and larger retailers began to install Teletype terminals, which provided faster access at reasonable cost when inquiries were keyed directly to credit bureau computers.

Wewers noted that only about 2,000 of the 40,000 total credit granters CBI units and customers serve have installed terminals. The remainder phone inquiries direct to one of CBI's eight regional offices or to one of the 16 independent credit bureaus who purchase services from CBI. Those inquiries are transmitted to Atlanta via Raytheon display terminals communicating in a 3270 mode. Teletype-generated inquiries provide the lion's share of the volume coming into Atlanta, however — almost 70% of the total number of inquiries made.

Expensive Overhead

That was the crux of CBI's problem: although Teletype inquiries were concentrated through strategically located, time-division multiplexers communicating with two Memorex 1270 front-end units, each port appeared, to the host, to have an individual Teletype terminal attached.

"Approximately 60% of the capacity of those two front ends was consumed by the 'handshaking' needed to support those Teletypes," Wewers recalled. "It was a tremendous hardware and software overhead burden, a very inefficient use of some very expensive resources. It made a great deal of sense to us to offload that traffic onto a less expensive device."

The network was upgraded by enhancing the PTS-100 with a function package consisting of a general-purpose communications adapter — a hardware interface between its system controller and a Teletype modem — and software to control the queuing in and out of Teletype message traffic. Five general-purpose communications adapters can be used with each PTS-100 controller, with each adapter able to handle four Teletype lines.

"All a credit granter has to do now is turn on a paper tape, key in identification and security codes, then key in the inquiries — as many inquiries as he wishes," Wewers explained. "He then dials the local credit bureau and places the phone in a telephone coupler or switches on the local low-speed data set. The PTS-100 answers automatically."

Messages travel from couplers over asynchronous lines at 110-, 300- or occasionally 1,200 bit/sec rates to low-speed modems at the PTS-100 locations, and those modems link directly to general-purpose communications adapters in the terminal system controller.

Sign-on information is transmitted directly to the host for authentication, after which inquiries, written into 256-byte buffers associated in PTS-100 memory with ports on the communications adapters, are transmitted to the 168 in Atlanta at rates of up to 9,600 bit/sec.

"We installed a Comten intelligent front end here to replace our 1270s," Wewers said, "with additional Comtens in Washington, D.C., and San Jose, Calif., to concentrate messages from Raytheon terminals emulating 3270 equipment. But all the host eventually 'sees' are what appear to be individual 3271 controllers, even though each controller may be handling as many as 20 Teletypes."

Credit granters see momentary pauses because inquiries are transmitted, processed and answered over the comhination slow-speed, high-speed route in 256-byte blocks. Response times at Teletype terminals reportedly will improve when the network is upgraded to a double-buffering scheme. Double-huffering will enble each PTS-100 controller to receive a 128-byte response from the 168 while transmitting the previous 128-hyte block to a remote Teletype terminal.

Automation in general has allowed CBI to consolidate into eight regional centers from more than 100 offices operating previously.

While some of those sites have only one PTS-100 system controller, others have as many as four, with terminal counts ranging from five to 43 and from one to seven 165 char./sec printers.

Firm Builds SDLC Net Without Vtam/NCP Upgrade

BUENA PARK, Calif. — Yamaba Parts Distributors, Inc. has established a cross-country communications network employing Synchronous Data Link Control (SDLC) protocol without implementing IBM Vtam/NCP software.

Avoiding that software upgrade saved months of programming time and effort for the company, according to Wayne Mitzel, manager of data communications at Yamaha. Monthly operating costs for the network are approximately half the costs of similar land line links, he said.

The company established communications links via satellite between an IBM 370/145 at corporate headquarters and warehouses serving the Southern and Midwestern states. The satellite links support both remote batch communications from card readers and printers and inquiries from 3270-type interactive terminals, under full-duplex SDLC protocol.

Central to that network is PIX-II, a minicomputer-based "virtual data link" from Paradyne Corp. By supplying intelligence at all points within the network, PIX-II allows remote peripheral devices to operate as if they were locally connected to a mainframe, Mitzel said.

"We installed a PIX-II local control unit at headquarters and remote control units at both warehouses," Mitzel said. "Our programming effort at the central site was completed within half a day. We simply had to reassemble our DOS supervisor to give it some new addresses and to reassemble our terminal control program under CICS."

Mitzel said Yamaha could have implemented SDLC either over land lines or via satellite. Either route would have required implementation of Vtam/NCP.

"Both packages consume core and computer cycle time," he explained. "The programming effort would have required months worth of time and effort — compared with days to implement SDLC using Paradyne equipment."

Mitzel added that implementation of SDLC would also have required hardware upgrades at the central and remote sites. "We would have had to upgrade our front-end controller, which was sufficient for binary synchronous communication but not for SDLC. By using the Paradyne system we were able to eliminate our front-end controller altogether."

Implementation of SDLC would also have required that remote batch equipment be upgraded to the SDLC equivalent. "Instead, we saved some by replacing our equipment with card readers and printers," Mitzel said.

Each week, Yamaha headquarters transmits to each warehouse a master inventory list for that location. Reports transmitted each morning from headquarters allowed warehouse managers to update that master list. That updating was done manually prior to installation of on-line CRTs with the PIX-II system.

Mitzel said the SDLC satellite network made possible by the PIX-II system provides response within an average of three seconds to inquiries from any remote warehouse to master files.

"A warehouse manager can now tell a customer on the phone whether a part is in local stock or in stock at another location. Having that up-to-date information close at hand allows our regional warehouses to provide a better response to the customers they serve," he said.

Prior to installation of the PIX-II system, Yamaha warehouses transmitted remote batch data over Wats lines at speeds of 4,800 bit/sec. Mitzel said the company upgraded to 9,600 bit/sec to accommodate 3270-type interactive terminals.

"Communication over land lines at that speed might have given us better terminal response times," he suggested, "but an average three-second response is very acceptable when you consider the cost savings afforded by satellite over land line communications."

Satellite communications links cost Yamaba approximately $1,500/mo. Mitzel said the cost of additional land lines needed to support interactive termianls would have been approximately $3,000/mo.

Original Goal

The ability to transmit inquiries from warehouses to the central data base had been Yamaha's original design goal, but that goal was rejected as too costly. Binary synchronous communication was too slow for the application, Mitzel noted, and SDLC appeared to require a major programming effort in addition to hardware upgrades.

Yamaha briefly considered the compromise of installing intelligent terminal systems at each warehouse, in order to maintain separate data bases for each location. Each data base would have contained up-to-date information on local inventory.

"That would have given us some improvement; but the inquiry capability would have been less than we really wanted and would still have required a significant programming effort. With PIX-II, all we have to do to add another warehouse to our network is install another remote control unit and plug in our peripherals," Mitzel stated.

Teleprocessing systems such as Btam, Tcam and Rtam are associated with specific devices, and each time a device in a network is changed, the software associated with that device must be changed. PIX-II eliminates the need for both front-end control units and teleprocessing software, he said. Host processors communicate through PIX-II local and remote control units to remote peripherals as if those devices were directly attached to the host.

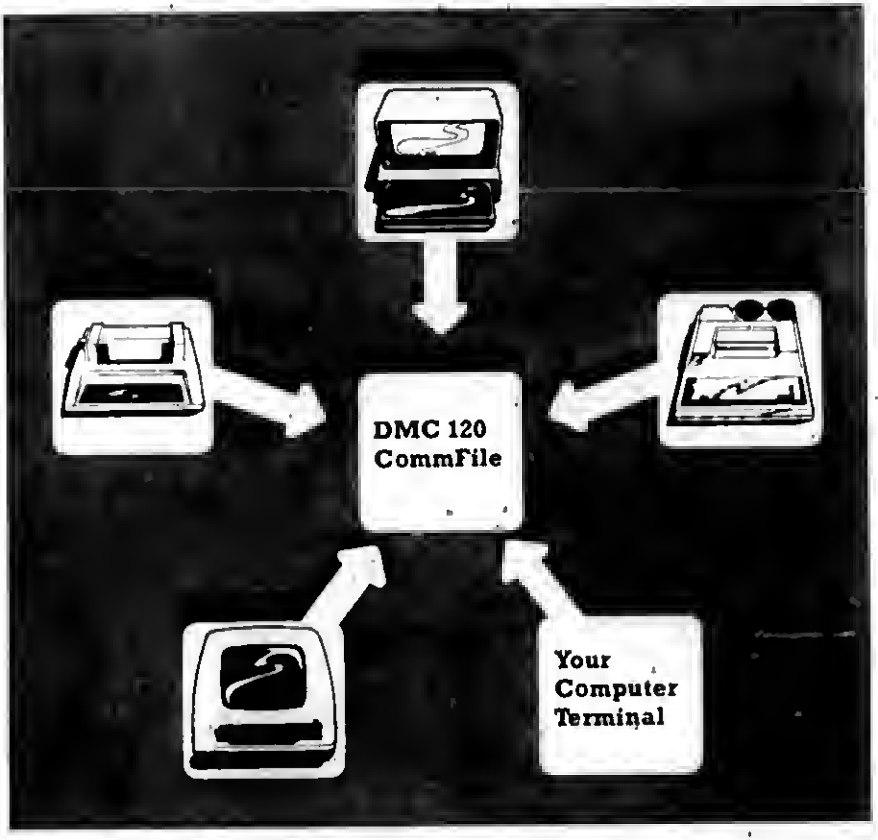
In Yamaba's PIX-II system, data transmitted from the IBM 370/145 host is stored in buffer memory until an SDLC frame is assembled with each device buffer tagged with an address. Data is compressed and transmitted from the local to the remote control unit in seven 256-byte frames and passed from the remote control unit to peripheral devices attached to that unit at each warehouse.

"I found the PIX-II concept hard to believe, at first, but since installation last fall the system has run with very minimal downtime. It seems that for us, PIX-II represents the easiest, most effective method of establishing satellite networks," Mitzel said.

DMC

We can make any dummy smart, even intelligent.

The CommFile is compatible with almost any data communication system. You can cut line costs, lower computer time, and eliminate errors in data entry and editing on **your** computer terminal.



Plug any dumb terminal into the DMC CommFile. You immediately get a powerful text storage, processing and communication system that is amazingly simple to use. With CommFile, you can:

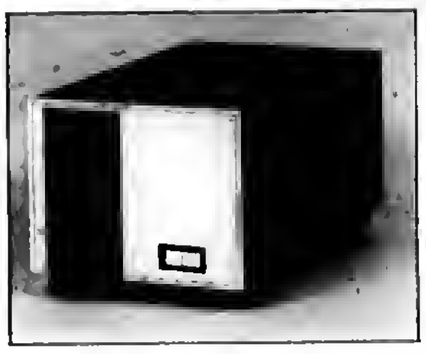
- Collect and store text from your terminal or timesharing system;
- Do comprehensive text editing and file management;
- Communicate these files to your timesharing system.

You can easily expand the basic turnkey system to a complete programmable CPU system with any or all of these valuable features:

- Up to 64K of memory;
- Up to four floppies;
- Text editor;
- Basic-Plus;
- Assembly language software;
- Word processing software for complex text formatting made simple.

Nationwide service (even for the machines you hang on) through central dispatch, toll-free.

For full information, call, TWX or write Tom Bowden at DMC. Use the coupon if you prefer.



CommFile converts your free-standing display or printer terminal into a high-speed data entry, editing and transmission station.

Even intelligent?

Tell me more about how to give any dummy instant smarts, even intelligence.

Remote Intelligent Terminals Seen Acting as Management Aid

By Fonnie H. Reagen Jr.
Special to Computerworld

Once, it was considered the height of system design sophistication to poll managers to determine their "information needs" and then to devise a set of reports that provided as many managers with as many of their requests as was practical. It was rather like giving a child his choice of as many candies as he could name — managers named all the pieces of information they could.

Cleverness in system design resulted in many combination reports that gave individual managers a different set of information pieces than they had requested. Data input followed the same pattern.

Managers had to provide some information that would be used to create information relationships, not for themselves, but for others. Computer usage thus developed under the control of a central facility with the sources and users (the managers) of the processed information frequently only peripherally involved in the system design.

The need to efficiently administer an expensive resource — the computer center — led to reduction in repetitious data storage and data manipulation through the development of data base management, which separates data processing activities from the data storage facility. A parallel hardware development has substantially reduced the cost of electronic circuits and small data storage devices.

Pressure on Remote Locations

One effect of these two developments has been to create pressure for the remote locations to reenter the field of system design.

The most obvious example of this trend is the positioning of intelligent (or programmable) terminals in remote company locations to provide access to the corporate data bank. The combination permits local management much flexibility in acquiring, storing and processing information and therefore should allow better decisions to be made.

Central management is under dual pressures because of the development of distributed processing and data bases. One side is that described above, the provision of local management with better tools to keep track of day-to-day operations and to make better decisions.

The other side is the desire to use the corporate data bank and processing capabilities to provide information processing on a corporate basis. Allocation of corporate resources, measurement of company effectiveness and control of company cost parameters all require detailed knowledge of what the company has done, what it is doing and what is is committed to do. Resource allocation also demands knowledge of the effects of planned future activities.

In general, the sum of all the information available to individual managers is used for corporate information needs.

This sets up a dual set of needs for local management: use of the comptuer to further understanding of day-to-day activities and to report to the central site for corporate information needs. This leads to the logical conclusion that one terminal in the local office should serve several purposes.

It is conceivable that a single monolithic set of application routines could be written to completely model a company's business within the fremework of a single "program." It would provide a single interface for the terminal with all information requests, data input, report output and data base updates handled by a single application system. However, this is unlikely.

A company's business is understood too incompletely to make a precise model. In addition, the company environment is too dynamic to permit a single model to remain unchanged. A general-purpose model is too inefficient.

Rather, we are faced with something with which we have always been faced: the development of multiple application systems as they become needed, as the people resources become available to implement them and as our knowledge of business and computers grow to the point of understanding the application.

Central System Architecture

Given the inevitability of multiple-application systems, each with the need for remote input and interaction, the question arises: What central application system architecture will best satisfy the needs?

Multiple terminals can be located at each remote site, each interfacing with a single application system, but the cost penalty of duplicated terminal equipment is obvious. Using a single terminal to interface multiple application systems introduces the additional host overhead to manage the interfaces, a cost that is not so obvious.

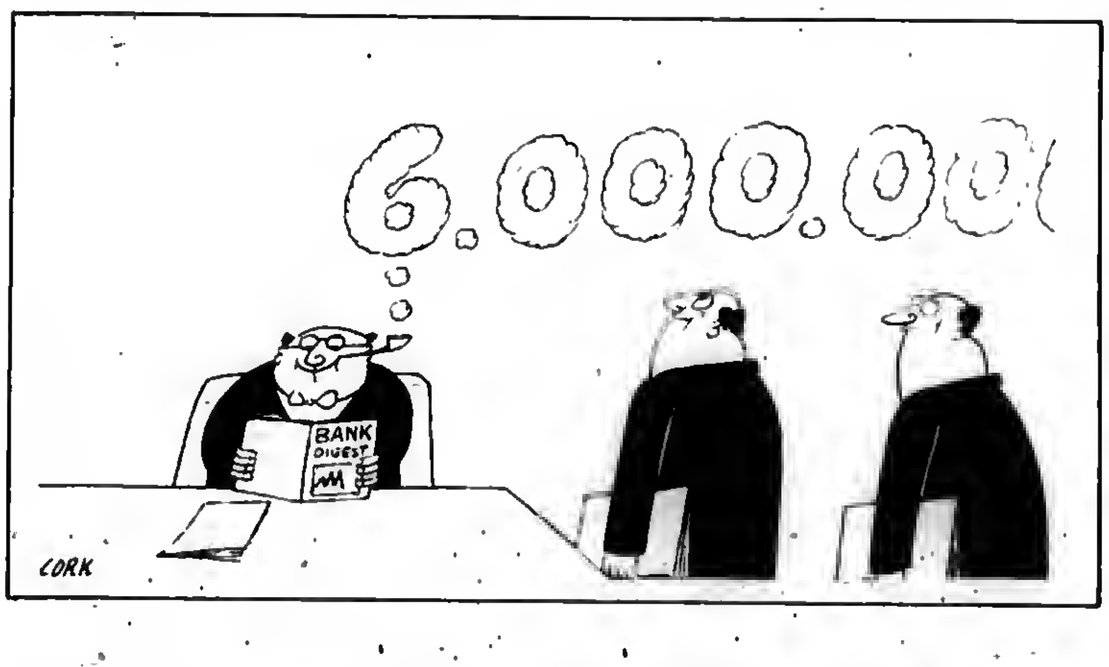
Additional decisions, such as determining application type, add to the system processing load, and a larger central computer is required just to maintain the same level of information processing. (The growth of main memory and CPU usage for the modern multitask operating system is ample testimony of the cost of implementing general-purpose capabilities.) That cost is justified on the basis of increased productivity and flexibility.

The availability of low-cost intelligent terminals makes multiapplication terminals practical. Tailoring functions of specific applications at the terminal site, rather than through host processing at the central site, almost eliminates the normally-expected increase in system overhead when converting to a "general-purpose" approach.

The extra cost of an intelligent terminal, compared to a nonprogrammable terminal, is easily offset by the reduction in the number of terminals required.

The net effect of multiapplication terminals implemented via programmable units is to improve information flow, data retention and data organization at the remote location while collecting the information the company needs for corporate analyses.

Fonnie Reagan is managing editor at Datapro Research Corp., Delran, N.J.



Low Cost Smart Polling Terminal

- Burroughs Polling (TD-820 compatible)
- Other polling protocals available
- Switch-Selective Polling/TTY emulation
- Unique character addressing (field alterable)

Plus all the features you'll expect in a Smart terminal.

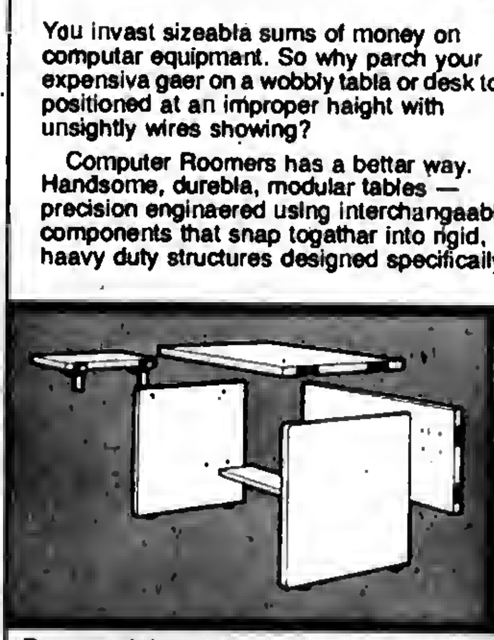
MODULAR TERMINAL TABLES...

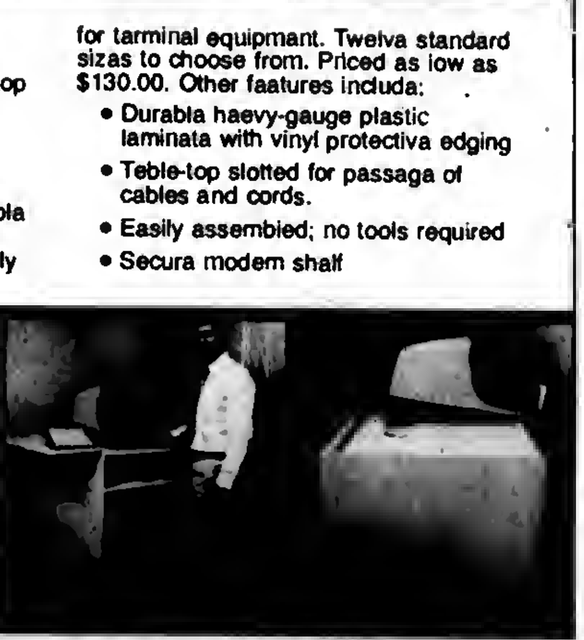
by Computer Roomers, Inc.

You invest sizeable sums of money on computer equipment. So why perch your expensive gear on a wobbly table or desk top positioned at an improper height with unsightly wires showing?

Computer Roomers has a better way. Handsome, durable, modular tables — precision engineered using interchangeable components that snap together into rigid, heavy duty structures designed specifically for terminal equipment. Twelve standard sizes to choose from. Priced as low as $130.00. Other features include:

- Durable heavy-gauge plastic laminate with vinyl protective edging
- Table-top slotted for passage of cables and cords.
- Easily assembled; no tools required
- Secure modem shelf





For more information, complete and return the attached coupon. Or contact:

COMPUTER ROOMERS, INC.

Slate Terminal System Handles S&L Transactions

DAYTON, Ohio — A service owned by nine savings and loan associations in the Dayton area is making it possible for customers to withdraw or deposit funds to their accounts at their supermarkets.

Named Slate (an acronym for Savings and Loan Automated Teller Exchange, Inc.), the service includes remote service units (RSUs) at the courtesy counters of local food stores which are on-line to a central DP center. Customer transactions are immediately debited or credited to appropriate accounts.

While they are associated for purposes of Slate, the member institutions are independent in all other aspects, including maintaining their own DP systems, according to Douglas R. Gannon, president.

One association uses the services of American Financial, in Cincinnati, as its computer center. Four others use the Savings and Loan Data Center in Cincinnati, which is a part of Automatic Data Processing. The remaining four associations use the NCR data center in Dayton.

"The associations were content with their DP services," Gannon recalled. "It would have been foolish to disrupt their systems to consolidate them all in one system just to handle the debit cards. Instead, we decided to interface with their systems."

To do this, Slate had to communicate with a conglomeration of equipment. American Financial uses an IBM 370/145 computer mainframe with a Periphonics Corp. front end. The FDS/I terminals are programmed to look like IBM 2980 terminals going into the front-end system.

Savings and Loan Data Center has a Burroughs B500 mainframe with a Varian Data Systems V72 front end. It uses a mixture of terminals — NCR 270 and Burroughs TC700 — so several protocols are used. The NCR Data Center uses an NCR Century 300 mainframe and NCR 270 and 279 financial terminals.

"We had a choice of establishing our own data center or buying shared service," Gannon noted. "We did not feel we wanted to go to the expense of equipment, people and software to build our own center. Instead, we surveyed a number of services and settled on the NCR data center here in Dayton."

In addition to being local to Gannon's operations, he said, NCR offered to underwrite the cost of developing the software to make the system operate. The software remains proprietary to NCR; however, Gannon feels it was a profitable trade-off for both Slate and NCR.

Software Objectives

One of the primary software objectives was the development of an electronic switch which makes it possible for any customers of any of the associations to use any of the in-store terminals. The switch software includes a file of tables which relate each card number to the issuing association.

Upon confirmation from the association's computer, the switch transmits confirmation back to the terminal, then debits the customer accounts and credits the store's reconciliation account.

The switching function is complicated by protocols. In one case, the NCR computer has to look like an IBM 2980 when it completes a transaction. In another, it has to look like a modification of an NCR 270 financial terminal, and in the third, like a "pure" NCR 270.

"The software is flexible enough to add a module into the switching system to look like whatever terminal an association utilizes," Gannon said. "When the data centers get our message, they treat us as if we were just another branch and some more tellers that have been added to their system. The switch then reformats the message for our terminals and sends it back out in the response."

Slate is one of only two such systems in the U.S. that utilizes an electronic switch, Gannon noted. The function can be performed by inserting hardware between the Slate CPU and the associations' data centers. Memory was available on the NCR data center's computer, though, so it was decided to use a partition of the NCR 300 computer as the switch.

Supermarket customer transacts business with savings and loan association through use of "Cash Plus/Prestige" card which gains access to system. Salesperson then enters transaction into NCR 279 financial terminal.

Furnishes Terminal Equipment

Slate furnishes all terminal equipment for use in the stores. Card verification is done through identikey units. These units use the card number and any combination of letters or numbers as the customer's personal identification number (PIN). The card number and PIN are fed into an algorithm which results in a third number. This number becomes the customer identification to the computer.

To make customer operation of the PIN entry pads simpler for the customer, Gannon changed the key caps from an adding-machine-style keypad to Touch-Tone telephone style because he felt it was better for the general public and would result in fewer keying errors.

Transactions are completed on NCR 279 financial terminals which Slate installs at the stores' courtesy counters. "These were one of many units we could have used," Gannon recalled. "A number of sites we visited were using them, so we knew they worked. But also important to us was the fact that very fast maintenance service was available."

Interassociation transfers were also a consideration in the design of the software system. Each of the associations and merchants has its own banking affiliations, Gannon said, and the intent was not to disturb these relationships just for the Slate service. Instead, the settlement transfers are handled in the Slate system using the commercial bank clearing system.

The Slate data processing system operates an hour longer than the stores are open each day to allow completion of cash

G77 Information Display Terminal
G-Series Printer

We can't give you one good reason for switching to Genesis One 3270 compatibles.

We can give you four.

1. *Available.* Genesis One® G77™ Information Display Terminals and G-Series Printers are ready to be put to work now. You don't have to wait up to 18 months for delivery.

2. *Economical.* IBM may have lowered their prices, but dollar for dollar, feature for feature Genesis One units are still the unbeatable values in computer peripherals today.

3. *Compatible.* Genesis One units are *directly* compatible with IBM 3277 Model 2, 3284, and 3286 terminals on 360's, 370's, System/3's, and 3790's. You just plug them in. Genesis One units are proven in use by thousands of units in hundreds of locations.

4. *Many Special Features.* For years Genesis One units have offered many special features which other companies are only now beginning to imitate. Like two LSI Memories for a steady image, Home and Repeat Keys, Automatic Visual Indication, Blinking Cursor, true Upper and Lower Case and more on the G77 Information Display Terminal. Our G-Series Printer boasts four models (60, 88, 120, 165 cps) and Vertical Forms Control, Adjustable Forms Tractors, Audible Alarm and Automatic Motor Control.

And if these aren't reasons enough for switching, consider this: All Genesis One peripherals are serviced by Sorbus Inc., one of the largest and most experienced service organizations in the industry. (In Canada, Western Europe and Australia Genesis One peripherals are sold and serviced by MAI International Corporation.)

If you are considering 3270 system peripherals, isn't it reasonable to look at Genesis One? Get more details. Call our nearest office or call direct at (212) 557-3500.

Using National Statistics

Terminals Help Patients Determine Life Expectancy

By Ann Dooley
Of the CW Staff

MADISON, Wis. — Patients at the Adult Medicine Clinic here can determine on a computer how long they have left to live and what they can do to prolong their lives.

The program shows people who are basically healthy how their living habits and medical history will affect their life expectancy, according to Dr. Larry Van Cura, a university professor.

The health hazard program consists of national statistics compiled at Methodist Hospital in Indianapolis on the most common causes of death, according to age, sex and race.

There are 15 major causes of death, some of which are auto accidents, suicide, homocide, accidents, pneumonia, stroke, leukemia and coronary artery disease.

These causes are correlated with risk factors such as use of alcohol or tobacco, miles driven, whether seat belts are worn, amount of exercise, blood pressure, serum-cholesterol, height and weight and medical background, Van Cura said.

The health hazard appraisal is an attempt to convey information to people about what the state of their health actually means in the long-range view, according to Van Cura. "We are trying to help well people stay well," he said.

Once people know the risks, hopefully they will change their behavior, he added.

Youth-Oriented Society

"We live in a youth-oriented society and when you tell someone they have the same risk of dying as someone older than they are, it makes them think," he said. "Probably more people are going to raise their level of health by decreasing risks than by any other method so far," Van Cura said.

Other medical centers use the same risk factor analysis, according to Van Cura, but Wisconsin is the only place where the patient directly accesses the computer.

The clinic has used patient/computer interaction for more than 10 years and patients often prefer the anonymity of the machine, Van Cura pointed out.

The patient types the answers to questions appearing on the screen of a Hazeltine 2000 CRT. It amounts to a 20- to 25-minute interview, he said.

The information includes questions on health patterns, medical backgorund and cholesterol level and blood pressure, if it is known. If it is not, it is added later after an examination, he explained.

The data is transmitted to a time-sharing computer at the University of Wisconsin Computer Center where the patient's results and risk of dying in the next 10 years are compared with the national average.

The computer is programmed to indicate the patient's physical health age. It also indicates which factors are most critical to that individual's health and what would most likely cause his death.

Both good and bad habits are taken into consideration before a prediction is made, Van Cura said.

The program has only been in operation since the first of this year but several hundred people have already used the computerized health hazard appraisal, he said. Eventually, he believes, such clinics will be available in the home by using a television screen to communicate with a main computer.

It is still too early to determine if the health hazard appraisal has changed people's actions and bad habits, according to Van Sura, but a follow-up study is being planned to find out if any beneficial changes have occurred.

Slate Data Terminals Track S&L Records

(Continued from Page S/36)

drawer balancing. At the end of the day, reports are printed for all associations and files are updated.

By the time the associations open the next morning, they have completely updated files and a complete audit trail of the previous day's transactions, according to Gannon.

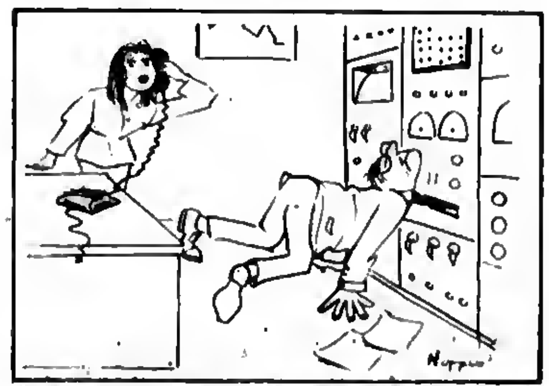
Daily Reports

The stores also receive daily reports on their terminals' activity, though neither the customer names nor association identifications are given. The reports, however, mirror the journal tapes in the NCR 279 terminals, so the stores can check the reports by sequence number.

"There was also a decision about what kind of cards we would use," Gannon reports. "Eight of the associations were Transmatic licensees for Prestige cards, and one was not. Geoffrey E. Hill and Associates, Inc., a consultant in Columbus, Ohio, designed new cards with the Prestige design and the words "Cash Plus" on the face. The back of the card has the Cash Plus Money Center design we chose for Slate.

Slate provides a complete service to associations using it. In addition to the data processing and card design services, Gannon's organization also trains both association and in-store employees and promotes new store placements and card use. It also secures licensing from the Federal Home Loan Bank Board for both new store placements and associations joining the network.

Now that the system is operating, Gannon expects to expand it to other thrift institutions in the area. "We've designed a very flexible system that gives the thrift institutions a lot of advantages without disrupting either banking affiliations or data processing operation," he concluded. "And we look for more to join Slate as our card base and supermarket locations grow."



"Hello? Acme Computer Service?"

DIGI-LOG MICROTERM II
DESK TOP TERMINAL POWERHOUSE

INTRODUCING MICROTERM® II
A uniquely integrated microsystem for OEMs and Large Users

Microterm II is a unique, multifunction, terminal system that takes the value-added vendor/user one step beyond competition. An entire random access system including dual Z80 processors, printer, CRT, and dual mini diskettes are successfully integrated into a single desk top unit that rests handsomely on a standard typing table. The power of Microterm II is released when your unique applications are added.

Microterm II has a powerful software development system that lets you convert your applications knowledge into valuable working software. Your programs can be totally developed from the Microterm II keyboard in either BASIC or Z80 Assembly Language.

At $6950 each, and $4865 OEM quantity of 100, the reliable Microterm II represents a business opportunity well worth your consideration. For additional details, call or write today.

When we plant a terminal...

It gets as much TLC as Marilyn gives her potted Spathiphyllum.

Terminals are just as sensitive as plants so it's important to pick the right one for *your* job. That's why Trendata offers a wide range of printing terminals and magnetic tape recorders to fit any number of applications.

And since terminal productivity stems from proper training, Trendata field reps make sure your people understand all the do's and don'ts of terminal operations.

Should maintenance problems arise, they are immediately pruned out by our own nation-wide service people. The last thing you need is a terminal withering on the line.

As we mentioned, anything that grows needs TLC . . . and if your system isn't getting Terminal Loving Care, we'd like to cultivate a little conversation.

trendata

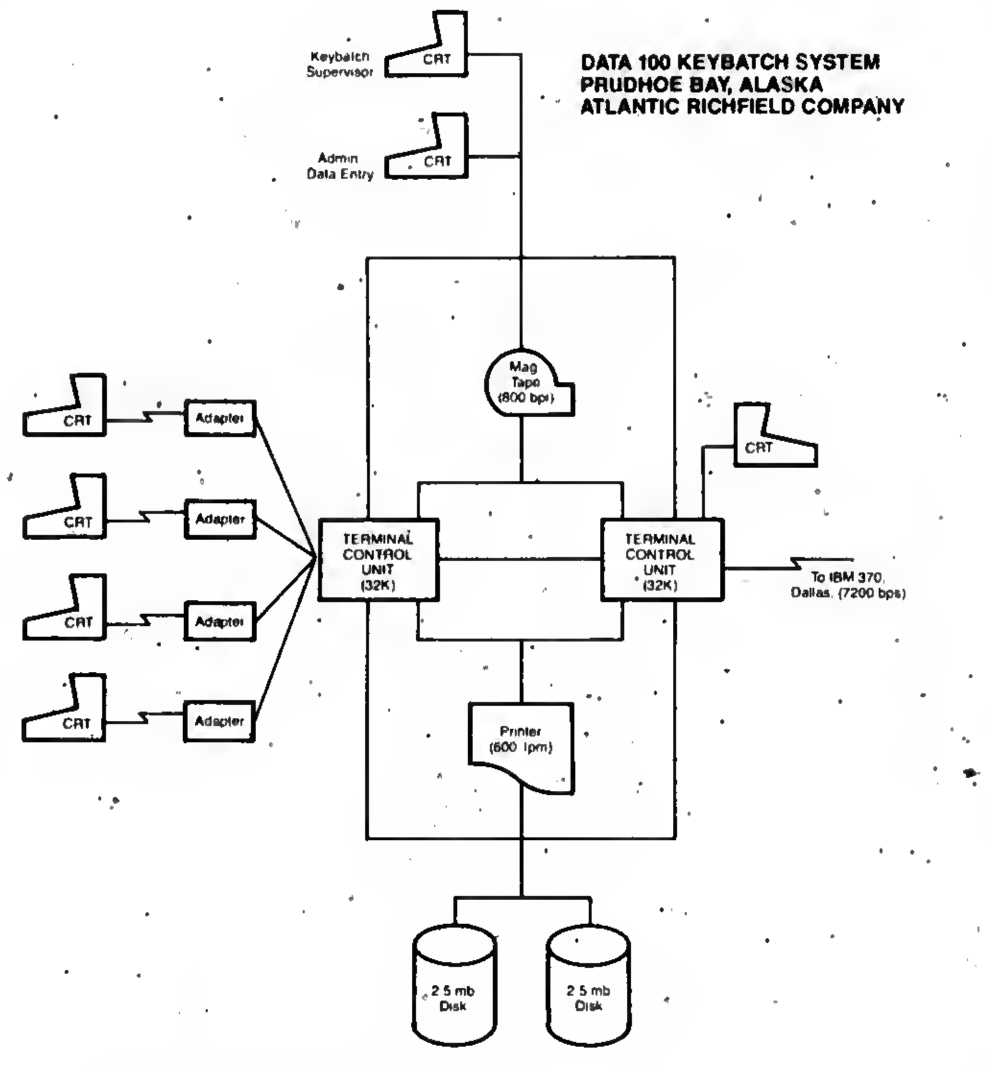
AN APPLIED MAGNETICS COMPANY

Arco Alaskan Terminal Network Keeps North Slope Oil Flowing

At Prudhoe Bay on Alaska's North Slope, drilling operations, production facility testing and other procedures are now producing oil for the Trans Alaska Pipeline.

One of the major owner companies involved is Atlantic Richfield Co., which operates the east side of the oil field. To effectively operate in this hostile environment, Atlantic Richfield performs around-the-clock preventive and remedial maintenance, material management and administrative programs. These systems use two Data 100 Keybatch remote terminal systems located in Alaska and connected by satellite telecommunication to an IBM 370/168 computer in Dallas.

The system enables Arco's Prudhoe Bay operations personnel to plan maintenance activities (workload leveling, reserving spare parts) and to follow correct job procedures (required tasks, skills and tools), while ensuring that maintenance is scheduled at predetermined intervals on equipment representing a large investment.



The system is also used to capture data concerning remedial maintenance performed. Management reports are produced which reflect the degree of adherence to schedules and to track equipment performance.

One Data 100 Keybatch system was installed in October 1976 in Anchorage. It is used mainly for processing administrative data. The second Keybatch system was installed In December 1976 at Prudhoe Bay. Each system has its own dedicated 7,200 bit/sec satellite channel which interfaces with Arconet, the company's private communications network.

According to H.M. Haseltine Jr., manager of systems and programming in the administrative department of Arco, the economics of operating on the North Slope dictate that required equipment maintenance be performed with as few people and as little paperwork as possible.

"This means developing a multifunction data entry/remote job entry system that minimizes DP throughput time in what amounts to almost a real-time environment," he said.

Arco initially looked for a single terminal which would provide the capability for both on-line interactive processing and remote data/job entry to support the batch environment. However, this was not possible with the hardware available then.

The compromise solution was two sets of hardware, Keybatch terminals supporting the remote entry and IBM 3275s supporting on-line functions.

The system at Prudhoe Bay consists of a central unit at the operations center and remote keystations at the activity locations. These remote stations are located in warehouse areas, maintenance shops and potentially at other major production installations.

These operational areas are linked to the central terminal controller/processor through the local microwave communication system. Communications capability, therefore, was an important factor in equipment selection.

The central terminal system in the opera-

(Continued on Page S/39)

'There Is Quite a Conflict Between Our Systems and Operations People.'

With Remote Batch Equipment Doing Preventive Maintenance

(Continued from Page S/38)

tions center consists of dual Keybatch terminal controllers with data channel, a 600 line/min printer, two 2.5M-byte disks, 800 bit/in. magnetic tape, various communications controllers and adapters and administrative and supervisory keystations.

All master files for Alaskan preventive maintenance are kept in the IBM 370 in Dallas. These define Prudhoe Bay equipment with regard to place, maintenance requirements and job history. The 370 automatically schedules jobs and sends job summaries to the remote site so that maintenance personnel can plan their activities.

The user at Prudhoe Bay has the option to decide what jobs he wishes to work on in a daily or weekly period. He may cancel, reschedule, initiate or substitute jobs as he sees fit. He enters transactions to the system through input of a job number followed by a key word and description. From this data, master files in Dallas are updated and job support documents are generated, where required, and transmitted back to the Keybatch printer at Prudhoe. An activity report regularly shows current status of each job.

The remote site operator may do both online inquiry and batch data entry. For online inquiry, the operator uses an IBM 3275 under CICS software. For batch data, such as transactions to update the master file, the operator keys in the transaction to the central Keybatch system where it is accumulated on the disk.

At some point during the day, whenever volume dictates, the central Keybatch terminal operator transmits the batched data to Dallas with the appropriate job control language to execute the catalog procedure for initial job processing.

When the master file updates are complete, the remote stations can do inquiries against the new data base through the 3275s.

The Anchorage installation has a dual-processor terminal system with a 450 card/-min card reader, a 9-track 800 bit/in. magnetic tape, two 600 line/min printers, a 10M-byte disk and four local Keybatch keystations. A peripheral switch between the two processors allows them to share common peripherals. Transactions from Anchorage involve administrative, production and payroll data, in addition to scientific applications such as reservoir engineering and geophysical modeling.

In addition to communicating via the 7,200 bit/sec dedicated satellite to Dallas, the Anchorage system has a dual-modem switch that enables switching over to a 4,800 bit/sec voice-grade dial-up line on the dial-up phone network. Thus, the system can interface with any data communications network having a comparable communications arrangement.

Hazeltine said that one of the main reasons why Arco chose the Keybatch system was operating system version 3.1, which contains a "communications save" and a "communications restore" software feature. It allows data to be transferred disk-to-disk on any Data 100 multifunction product in the Arco network.

An operator can do a communications save for any particular data set. This transmits the data set to an output queue on the 370 and then on to whatever terminal site needs the information, thus eliminating transferring hard copy, he said.

Arco has developed application software interfacing the material management system for automatically expediting the issue of parts needed in maintenance. When the preventive maintenance section has decided what job has to be done, the 370 automatically generates a parts picking ticket which is transmitted to the designated storeroom, giving location of job, identification of parts and quantity.

Storeroom attendants pick the parts and deliver them to a staging area so they are ready when maintenance personnel arrive to begin the job. When the job is complete, data is entered into the system indicating parts used and manhours expended, from which a history file is created in the mainframe.

Hazeltine said they use practically all the software functions available on the Keybatch operating system. The number of batches submitted from Prudhoe will average 20 per week, depending on master file maintenance volumes and on-request needs.

The multi-function Data 100 systems in Alaska, combining data entry and communications functions, serve as part of a system which provides high-speed filing systems and "alarm clocks" to facilitate the efficient performance of maintenance work.

Thus, the systems contribute to more efficient operation and reduction of operating costs in the harsh environment of Alaska's North Slope, Hazeltine said.

The first wide carriage portable with total recall.

Our Execuport 3000 has an exclusive data logger that can print all of the control characters. Result? You get a continuous, graphic record of the data stream. An important tool for program de-bugging and system analysis.

Other features? How about a wide carriage (that also takes narrow paper), plotting with 1/4-line stepping, optional ASCII/APL switchable codes, and an acoustic coupler.

But we aren't just the foremost name in terminals. We're also big with accessories.

- 420 – Portable Magnetic Tape Cassette
- 625 – High speed Paper Tape Reader/Punch with optional numerical machine control code
- 725 – High speed Paper Tape Reader

These units interface with all Execuport printing terminals to provide a system design relationship. Each is plug compatible, through standard RS 232 connectors, with any other terminal in the industry.

So when you want improved communications with your computer system, think of forming a terminal relationship with CTSI. Just call Charles Kaplan, or Shirley Newman at (201) 261-6800 for all the information you need.

Computer Transceiver Systems, Inc., East 66 Midland Avenue, Paramus, New Jersey 07652.

Try One Trivex With Your 3270s Instead Of Biting The Bullet.

You'd like to replace your IBM 3270s with more versatile terminals. It'd make you a hero. But the first step is like biting the bullet because things could blow up in your face.

That's why Trivex invented the free 30-day Mix and Match Plan. It gets rid of the risk of obsoleting your system. Or hurting your user service reputation.

Here's how it works: We'll give you one of our Trivex Plus 70 terminals (or a system if you want) to try for 30 days. Free. Just plug it in. There's nothing else to do because it's *completely* compatible with IBM 3270 units.

The same goes for our controllers and printers. So you can mix and match our equipment with IBM's any way you want to.

Then sit back and see how well it works. Our terminals not only cost less than IBM's, you'll find they give you more. Like in-line, on-line and off-line diagnostic capability. Local display-to-print capability. OCR Wand. High-resolution, non-glare CRT. And a low-profile, easier-to-use keyboard. Features you won't get from IBM for years. If ever. And all Trivex 3270-compatible devices are microprocessor controlled. They're software-modifiable to future changes in network requirements.

When your 30 days are up, either unplug our Plus 70 System and send it back or keep it. It's a painless decision.

To try our high-calibre terminals, call the number below or write us on your letterhead. Our sales rep will bring you information on our free 30-day Mix and Match Plan along with an Executive Decision-Making Kit complete with operating instructions and a real bullet.

It's one offer you should bite on.

COMPUTER INDUSTRY

CCIA and Others Testify

S.285 Would Put More Monies in Small Businesses

By Edith Holmes
Of the CW Staff

WASHINGTON, D.C. — Too many private pension assets are tied up in large, secure corporations, leaving little of this money to be invested in small and medium-sized businesses, several proponents of a bill that would alter that situation told the Senate Finance Committee and the Select Committee on Small Business here recently.

The current distribution of these funds is both "inequitable and imprudent," according to A.G.W. (Jack) Biddle, president of the Computer & Communications Industry Association (CCIA).

The CCIA, MRI Systems Corp. chairman Alfred A. King and Cummins-Allison Corp. president John E. Jones testified in support of S.285 known as the "Tax-Exempt Private Pension Investment Act of 1977. "S.285 would put investment limitations on large pension managers so private pension plan participants would not find their money tied up in a few corporate stocks.

Small and medium-sized businesses would benefit from the passage of the bill, sponsored by Sen. Lloyd M. Bentsen (D-Texas), because more pension monies would be freed for investment on their ventures, Biddle suggested. The availability of pension funds would help these businesses solve part of the overall problem of capital formation which threatens their existence, he added.

The present situation is one in which "small and medium-sized businesses have been stalled and shut off from funds badly needed for productive growth [and] are not able to contribute their full share of vigor to the american economy," King told the senators.

The MRI chairman stated it is the small growth company, and not the mature dominant one, which brings innovation and new technology to the marketplace.

"I am sure that fund managers have a myriad of defenses for the close relationship that exists between them and large corporations. None of them, however, can be persuasive against the very real threat to the economic viability of the U.S. and to our free enterprise economic system," King said.

"Fortunately, America has not lost its entrepreneurs," he maintained. But as reasonable after-tax guards continue to be taken away from the entrepreneur, "There is no more incentive for the individual who sticks his neck out."

From King's viewpoint, S.285 "confronts head-on the issues of reducing the interrelationship between the [Private Pension] institutions and large corporations and returning the flow of equity capital to smaller businesses."

Favoring the "carrot" to the "stick" approach, however, King added the sale of securities of large corporations might be taxed at a low rate for the capital gains they produce or might be permitted on a tax-free basis if the funds are reinvested within a defined period of time in small or medium-sized businesses.

Also testifying in support of S.285, Cummins-Allison's Jones told the commit-

(Continued on Page 38)

What's at Stake

S.285 would put an excise tax on pension managers, effective Dec. 31 of this year.

If the bill is passed, a 5% tax will apply on investment if the pension assets are greater than $1 billion, if investment is in a corporation with a capital account greater than $150 million and if, as a result of the investment, the manager has greater than 5% of any class of the corporate security.

If this "violation" is not corrected within 180 days, S.285 calls for the levy of a tax of 100% on the investment.

Lower Prices, More Capability Highlight Dumb Terminal Moves

By Molly Upton
Of the CW Staff

While denials of a price war abound among terminal makers, there is no dearth of action in the low end of the product lines.

The evolving trend is twofold: lower prices for bottom-of-the-line products, as from Lear Siegler, Inc., and more capability for the same price or less, as from Infoton, Inc. and Beehive International, Inc.

Lear Siegler, which recently dropped the price of its bottom-of-the-line ADM-3 terminal to $895, contends the unit isn't the cheapest and the firm doesn't intend to have the lowest prices, according to Lee Falco, vice-president and general manager of the Data Products Group. "We're shipping all we can right now," he said.

However, other vendors expressed surprise at Lear Siegler's ability to cite such a low price because it uses distributors rather than direct sales.

Falco said he doesn't know of any price war — "no more than usual" — and added he doesn't encourage bottom-line pricing.

Factors contributing to the price cut were advances in technology and competition. "Let's face it, if it weren't for competition our price would be $1,295," Falco said.

Prices on dumb terminals will probably stabilize for the next 12 to 18 months, Falco said, and then technology will bring more price reductions.

Dave Zeiter, product manager for terminals at Beehive International, agreed prices on low-end terminals have stabilized for a while, adding there will likely be a price break on other terminals next spring.

Thanks to increasing use of semiconductor components there will be increased capabilities on terminals at a lower price than presently, he said.

The number of features offered within the past year on Beehive's low-end terminal have grown by 20%, but the price hasn't changed, he noted. These features include blinking, cursor control and format control whose capabilities are provided by the semiconductor components.

Most of the firm's sales of dumb terminals are in the $800 to $1,000 range, he said.

Infoton's approach is exemplified by its

(Continued on Page 38)

HIS vs. Arizona Continues

PHOENIX — Attorneys for plaintiff Honeywell Information Systems, Inc., defendant State of Arizona and intervenor Sperry Univac recently met in a crowd-packed court here to present verbal arguments in HIS' suit against a state computer procurement.

Following the oral arguments, the judge took the matter under advisement and issued a preliminary injunction barring the State of Arizona from awarding the contract until he makes a ruling.

HIS had previously obtained a preliminary restraining order after learning it had lost a state contract to Univac, despite the fact its bid was lowest.

The request for proposal (RFP) was for a replacement for an IBM 370/145 used by Arizona to participate in a nationwide job-matching network. Participation in the Economic Security Automation Plan (Esap) is funded by the Department of Labor but administered by the individual states [CW, June 20].

RFPs issued last January resulted in bids from HIS, for a 66/10 at $661,171; from IBM, for a 370/148 or alternatively for a 370/158 at $2.1 million; from Univac, for a 1100/80 at $1.4 million; and from Comdisco for a 370/158.

HIS was advised it had the lowest submitted price for that particular element of the procurement — the mainframe and memory components, according to an HIS spokesman.

Following the submission and opening of the bids, however, IBM announced its nationwide price decrease for the 158s.

HIS and the other vendors were subsequently informed by letter that all bids were rejected by the Arizona Department of Administration based on a determination that it was in the public interest to have a rebidding, presumably because of the reduction in 158 prices.

A second round of bids was submitted April 25. HIS changed its proposal to a 66/40, which it felt was comparable to a 158 in performance, priced at $1.01 million. Univac rebid the 1100/80, but lowered the price to $1.3 million; Comdisco bid its 158 at $1.3 million; and IBM rebid a 158 but dropped its price to $1.5 million, he said.

HIS was then informed by the purchasing section of the State of Arizona that the 66/40 bid was "nonresponsive" and therefore would not be considered for contract award.

HIS protested the refusal, resulting in the restraining order.

It's only logical that you should consider a used 370/165 while waiting for your new IBM 3033.

While you're waiting up to two years for delivery of a new IBM 3033, you can increase your processing power and save money. Just lease or buy a used 370 165 from COMDISCO.

Twice as fast as a 370 158, yet only half the cost, a used 370 165 from COMDISCO makes a lot of sense. When you re-think about it, why wait to get more computer power, at less cost? A 370 165 from COMDISCO is the logical choice.

'Crazy Quilt' of Laws Hit for Frustrating U.S. Trade

WASHINGTON, D.C. — Special-interest laws and shortsighted governmental policies are dulling the American competitive edge in world markets, especially in advanced technologies where the U.S. excels, according to Charles Wohlstetter, chairman and chief executive officer of Continental Telephone Companies.

Wohlstetter singled out communications and data handling, which are not labor-intensive but draw on high technology, as foreign trade areas that offer particularly good opportunities for American participation. A "crazy quilt" of conflicting laws and policies, however, is frustrating the best intentioned efforts of industry to exploit these opportunities, he said at a recent seminar here.

Citing the German, French, and Japanese governments in particular, Wohlstetter said they enthusiastically support their own industries in recognizing that many foreign sales depend on financing and extended terms as surely as favorable interest rates and payment schedules affect the saleability of a house or car.

"In the years from 1970 to 1976, the volume of Japanese exports has increased at twice the rate of our own. In four of the last 10 years, the value of U.S. imports has been greater than our exports. This year's deficit could easily be larger than any in the past," he said.

Perhaps the most crippling blow ever struck against U.S. export trade came with the passage of the Tax Reform Act of 1976, Wohlstetter said. Three of its most damaging features were the recapturing of the previously deductible corporate tax credit on foreign losses, the elimination of the special tax benefits awarded to U.S. companies in developing nations and — worst of all in his opinion — the lowering of the earned income exclusion for U.S. citizens working abroad.

The last provision, Wohlstetter said, has resulted in an outflow of American engineers and administrators during the last year from the Middle East, the fastest growing world market. Since extra compensation to redress the high expense of foreign living is now taxable, an American firm can hire approximately two and a half British engineers for the price of one from the U.S.

This deprives American telecommunications companies of a prime competitive advantage, the ability to export qualified people to manage, operate and maintain the systems they sell overseas, he stated.

Low-End Terminal Mart Active

(Continued from Page 37)

1200, a terminal with an end-user price of $1,195, which is less expensive than its predecessor GTX model although the unit offers more features, according to Ed McCormack, director of marketing.

Other firms such as Hazeltine and Applied Digital Data Systems have done the same thing, he observed.

Although Infoton's price on the 1200 drops to $850 in quantities of 100, McCormack said, the firm has no plans to announce a "rock-bottom low-end terminal." It's much tougher to make a profit in the barebones area since profit depends heavily on volume, he said.

The majority of Lear Siegler's terminal business is in the dumb terminal area, although the firm has announced its entry into the intelligent field with its Video Display Processor 400.

In the year just completed, the firm sold about $30 million in CRTs and is now shipping over 2,000 unit/mo. This figure will probably approach 3,000/mo by the end of the year, Falco said.

Beehive's Zeiter said his firm decided not to go after ADM-3-type business because it wants to keep a decent margin for its distributors.

Although Beehive's B100 is selling well, Zeiter said he does not consider it a direct competitor with the ADM-3 because it is field-upgradable.

People like the idea of the cheapest price, but they also want 30% more features at a least-cost price. Many of these select the B100, he said.

Out of its entire terminal line, about half the shipments are in the low-end teletypewriter arena, he said, whereas this probably contributes only 35% to revenues.

Beehive plans to definitely ship more than twice as many dumb terminals as last year, when the B100 was not in full production, Zeiter said.

S.285 Puts Capital In Small Businesses

(Continued from Page 37)

tees his company "has been limited to debt financing to sustain its steady growth of between 10% and 15% per year.

"With a more favorable investment climate, with the availability of external equity capital to Cummins, I feel its growth rate could increase to 25% to 35% over the next three to five years," he said.

The Cummins-Allision president identified other needed steps in pension and capital formation reform. These included a reduction in the cost and amount of federally required paperwork and a return to lowered taxation of capital gains.

Jones also cautioned the committee members that while "elimination of the double taxation of dividends may also provide some relief, such tax reform would tend to benefit only the larger companies who are able to pay dividends.

"Growth companies cannot afford to pay out substantial dividends, if indeed they can pay them out at all, since the earnings before any declaration of dividends must be used to finance growth," he added.

"We cannot trade capital gains reform for the elimination of double taxation of dividends. [This] would further isolate the small and medium-sized companies from the capital markets. And the capital drawing power of the large corporations over the financial markets would be assured," Jones maintained.

Returning to S.285 and emphasizing the duty of the pension manager toward the people participating in the private pension plan, said, "We may realize that the present conduct of the portfolio manager is defensive in nature, but it is certainly not defensible conduct in view of the pensioner's entitlement to the best yields he or she can get."

S.285 is a "much needed first step toward a reform of the too conservative standards of the pension funds," Biddle stated for the CCIA.

When less computer equals more performance, small really is beautiful.

A special report on *Minicomputers and Small Systems* in the August 29th *Computerworld.*

Minis are now functioning at every level of business and industry, and *Computerworld's* August 29th special report, edited by Esther Surden, will focus on several issues that are currently the subject of widespread discussion and debate in the minicomputer field.
We'll also cover minicomputer hardware in depth — including microcomputers being used in data processing systems. In all, you'll see a variety of applications stories and tutorials on topics like these:

- Programming languages for small business systems — commentary on languages that have the same name but because of the "improvements" added by competing vendors, may have wide variences in operating efficiency.
- How to evaluate technical evaluations — a look at what benchmark tests and product specifications mean.
- The evaluation and selection process — a case study.
- Minicomputer maintenance — analysis of possible methods (vendor maintenance, independent service organizations, and end user self-support) with an eye to cost savings.
- Minicomputers in distributed processing — stand alone and communicating.
- Using minicomputer equipment — including general purpose minis, small business systems, turnkey systems, miniperipherals and microcomputers.

If you're interested in finding new ways to make data processing more useful and cost effective throughout your organization, you should read our special report in August 29th issue And if you're a mini manufacturer, OEM or systems house who's interested in telling potential customers how your equipment can help them in their jobs — advertise here. Your *Computerworld* salesman can give you complete details. But don't miss the August 12th ad closing date. Call Terry Williams at (617) 965-5800 to reserve space for your ad.

The loneliness of the long-distance computer.

From a distributed processing site, the staff and support of your headquarters data center seem a long way off. Successful operations therefore require that every remote site be supported by fast, effective field engineering.

Since 1970, Four-Phase Systems has been building a field engineering organization specifically designed to support distributed processing networks. Today, a staff of more than 350 Four-Phase field engineers provides round-the-clock service from over 70 offices nationwide. And each office is staffed by technical professionals with an average of seven years of data equipment service experience and six months full-time classroom training at our corporate education center.

These skilled, experienced technicians are supported by such advanced maintenance tools as remote diagnostics, a national alert center, computer-managed spare parts inventories at over 200 sites, and a critical spares program that can deliver needed components almost anywhere in an average of six hours.

But quick, effective maintenance is only part of the Four-Phase field engineering concept.

Our rigorously-administered preventive maintenance program helps insure maximum system availability. And each service incident is carefully analyzed by our headquarters field support group to guide Four-Phase product engineering toward even higher equipment reliability.

By building a field engineering force specializing in network support, and by continuously refining equipment designs to enhance reliability, Four-Phase achieved a nationwide multi-shift uptime record of better than 99% in 1976. And when a service incident did occur, the mean-time-to-repair was less than three hours including dispatch and travel time… nationwide, 24-hours-a-day.

Four-Phase Systems®

F&S Sees Militarized DP Mart Growing at Annual 12%

By Toni Wiseman
Of the CW Staff

NEW YORK — Militarized computers represent a substantial and growing market — one that will grow from slightly over $400 million in 1977 to more than $650 million by 1981, according to Frost & Sullivan, Inc. (F&S), a market research firm here.

The growth, which averages approximately 12% per year, is attributed to the increasing complexity of military systems, increasing costs resulting from inflation and the increased utilization of computers as components of subsystems that previously used special-purpose computational and control elements, an F&S report noted.

F&S defined a militarized computer as one "designed to meet military performance specifications in terms of ruggedness, [mean time between failures, mean time to recovery] and environment; general-purpose in nature, i.e. programmable; primarily digital; and identifiable as a separate and distinct element of any system or subsystem in which it is used."

The Air Force's B-1 bomber, a major program for that segment of the armed forces, will demand 5,000 computers of varying sophistication, the report said.

Total Air Force computer funding was projected to rise 68% in the 1977-81 period for a cumulative budget of $1.0 billion, with aircraft and avionics systems accounting for 50% of the total.

Avionics R&D budgeting during the five-year period will account for $68 million, the study noted.

The Navy and Marine Corps will spend approximately $915 million during the five-year period, with combined aircraft/-avionics programs emerging as the primary Navy submarket. This submarket will grow at a rate of 56% during the period to $420 million, F&S predicted.

Army computer expenditures are expected to grow 57%, reaching a total of $705 million for the period. Here again the aircraft/avionics submarket will lead, with weapon control/command control and missile systems computer needs following.

"There is a strong and increasing trend toward standardization throughout the Department of Defense. At the same time, there is an increasing trend toward proliferation of computer types by industry as microprocessors are used in a wider range of systems," F&S noted.

"As recently as a decade ago, the military computer market was dominated by a relatively small number of firms that had the resources to design and support state-of-the-art computer systems.

"Today, low-cost reliable integrated circuits, microprocessors, memories and related devices open up the market to a much broader range of companies," F&S stated. In recent years, it added, the challenge of militarized computer design has shifted to the mechanical packaging with the electrical design playing a much smaller part.

DataComm 78 Set for February

WASHINGTON, D.C. — Some 75 companies, 250 speakers and 4,000 data communications professionals and managers are expected to be on hand for DataComm 78 when it is held at the Sheraton Park Hotel here Feb. 21-23.

Several members of the DataComm 78 advisory group have been named, including Thomas Pyke of the National Bureau of Standards, George Berstein of the Naval Supply Systems Command, Elizabeth Severino of EFS Associates and Fred O'Keefe of the Association of Data Communications User.

This year's program will be broken into three segments. A "basics" program has been designed for users who are not yet using data communications. Sessions will deal with planning, selecting and implementing data communications systems.

A series of in-depth workshops will provide information on narrowly defined fields such as network analysis; data communications software; and terminal, modem and multiplexer capabilities.

Finally, the conference will feature product "rap sessions" during which a panel of vendors and users will discuss trends in 18 product areas.

The fee for the conference and exhibit is $45 for one day, $115 for all three days. Further information is available from Ed Halsted at The Conference Co., 60 Austin St., Newton, Mass. 02160.

OEM Sales Flourishing

Paradyne Seeks Unique Solutions in Communications

By Toni Wiseman
Of the CW Staff

LARGO, Fla. — Paradyne Corp. views its role in the industry as a provider and developer of products that offer unique solutions to many of the most common and complex tasks in computer-based data communications systems — for both end users and OEMs.

Robert S. Wiggins, president, said the company's strategy has been to provide product innovation in three ways:

- First, by identifying and committing early to technologies that appear to have broad future potential.
- Second, by incorporating features in its products that substantially reduce the complexity a user would otherwise encounter in performing data communications tasks.
- Third, by enhancing the functional range of its products well beyond the performance specifications of products offered by other suppliers.

A privately owned firm, Paradyne had revenues of $10.7 million last year and expects to grow between 30% and 35% annually, according to Jay Hill, vice-president of marketing.

Paradyne's revenues are derived from two product lines — high-speed modems and PIX II, Hill noted.

PIX II is a virtual data link system which allows IBM 360/370 users to perform remote processing over a variety of communications media, such as dial networks, private land lines, digital networks and satellite facilities.

Paradyne concentrates on high-speed modems, mainly 9,600 bit/-sec and some 4,800 bit/sec units, an area it plans to expand in with microprocessor technology, Hill said.

Modems account for a third of the firm's U.S. revenues and half of its international revenues. A large portion of its sales are OEM, he said, noting three OEM contracts alone — with Burroughs Corp., Nippon Electric Co. and L.M. Erricson — will amount to $5 million over the next few years.

Aside from AT&T, Paradyne's main competition is Codex and Milgo in the 9,600 bit/sec market and Milgo in the 4,800 bit/sec arena, he said.

"We're much more aggressive than anyone else on purchase prices," Hill stated. "All our competitors put out high-quality products, so we have to use all the marketing strategies we can, and one is to stimulate sales through prices."

Paradyne's lease pricing is also very close to most others in almost every situation, he noted.

"Our modems are known to have one functional advantage over others — they work on unconditioned lines better than anyone else's," Hill claimed.

OEM Business

OEM sales account for about 25% of Paradyne's business, according to Robert Budenstein, director of OEM international sales.

On the OEM side, modems comprise the majority of sales as both users and manufacturers become aware of technology advances and what these advances can mean in operation.

"Users, for instance, are becoming more sophisticated and understand their own needs better. They don't just buy the newest product in a manufacturer's line anymore," Budenstein stated.

Paradyne, he indicated, is now providing terminal manufacturers with the ability to Integrate high-speed communications capability into their terminals, tailored to their needs and in such a way as to provide the end user with a total single-vendor capability.

Integrated modems are becoming more and more viable for terminal manufacturers, he asserted.

"With the introduction of LSI there were less things to go wrong. And with the introduction of minis combined with LSI technology, we have a situation which says there are a limited number of printed circuit cards to do the job, so servicing becomes easy — in many cases simply a case of finding the bad card and replacing it on the spot," Budenstein said.

Maintenance no longer requires a highly skilled technology-oriented engineer, he added.

Taken as a whole, this means the user can demand a protective umbrella — one phone call to one vendor when something goes wrong, be it in the terminal or the modem.

"Paradyne has the expertise in-house to provide, modify and manufacture communications equipment tailored to the needs of the terminal maker. This means the manufacturer doesn't have to refit the terminal to the modem, which is a lot different than buying an 8080 chip off the self," Budenstein said.

Count on GA for big COBOL performance in multi-terminal applications.

And count on the lowest cost per terminal. Available now, General Automation's new 440 Data Series, starting below $45,000, recognized for the best price/performance package in the computer field: "...It always works...far superior to any other full systems less than $80,000. Any comparable system will cost over $175,000."*

1. **The most powerful ANSI COBOL**—years ahead of any other tested. Complies 3-to-10 times faster than a 370/145.
2. **Store 160 megabytes; 1 second response.** Support 16 terminals with less than 1 sec response; 128 KB main memory. Store up to 160 megabytes on disk, with the 720ns GA 440 minicomputer.
3. **Concurrent batch and on-line processing.** With shared data-base protection: maximum multi-terminal access with minimum user-contention, all operating in our field-proven File Management System.
4. **GA 440: fully field-proven and GA-serviced,** in more than 500 installations around the world to date.
5. **Exhaustive system-testing:** over 400 different combinations rigorously tested for response time.

Count on GA for all your distributed processing systems—from a basic 2-terminal system to a 10,000-terminal network; from factory and business data collection to corporate networking systems—through our advanced line of high-technology mini and microcomputers. You'll be joining the world's largest corporations who now count on GA for the most productive system solutions: in financial, industrial and telecommunications applications.

Mainframers' Ink Runs Black in First Half

•IBM Net Grows 11%

ARMONK, N.Y. — IBM Corp.'s six-month results for worldwide operations benefited from a 10.8% increase in gross income from rentals and services.

Earnings for the quarter ended June 30 rose 11% to $658-million or $4.44 a share compared with $592.8 million or $3.95 a share during the same period last year. Earnings in the first quarter of the year rose only 5.3%.

Revenues grew to $4.419 billion, up from $4.014 billion in the year-ago quarter.

For the six months, earnings climbed to $1.23 billion or $8.26 a share based on an average of 149.2 million outstanding shares. For the same period in 1976, earnings totaled $1.14 billion or $7.57 a share on 150.2 million shares.

Revenues for the six months were $8.509 billion compared with $7.828 billion in the year-ago period.

Gross income from rentals and service rose 7.5% for the six-month period to $5.467 billion, up from $5.083 billion. Income from sales totaled $3.042 billion compared with $2.744 billion in the 1976 half-year.

For the quarter, sales income rose 14.4% while rental and service income grew 7.6%.

"Outright purchases of data processing equipment for the second quarter increased substantially over the levels of both the first quarter of 1977 and the second quarter of 1976," according to Frank T. Cary, chairman of the board.

"Incoming orders and shipments continue to show good increases over the comparable 1976 periods," he added.

•NCR Sees 86% Increase

DAYTON, Ohio — A surge in earnings from overseas operations contributed to an 86% increase in earnings for NCR Corp. during the second quarter.

Earnings soared to $34.4 million or $1.23 a share compared with $18.5 million or 72 cents a share in the year-ago period.

Revenues also rose — 13% — to $627.8 million, up from $556.3 million a year ago.

Second-quarter results brought six-month earnings to $51 million or $1.84 a share, a 61% increase over the 1976 half's $31.7 million or $1.26 a share.

Revenues for the period climbed to $1.14 billion, an 11% increase over the 1976 half's $31.7 million or $1.26 a share.

William S. Anderson, NCR chairman, said that although the company's U.S. operations were the largest contributor to second-quarter earnings increases, net income outside the U.S. was also well ahead of last year. This contrasted with this year's first quarter, in which earnings outside the U.S. were relatively flat.

"Better business conditions were reflected in a high level of shipments of computers and terminal products during the second quarter," Anderson said. "A second favorable factor was improvement in margins resulting from manufacturing cost-reduction programs."

He also cited improved profit contributions from the field engineering and Appleton Papers divisions and from Data Pathing, Inc.

"We anticipate continued good earnings growth in the third and fourth quarters. However, the percentage gains are not expected to match those of the first six months, since earnings in the last half of 1976 were considerably stronger than those of the first half," Anderson said.

Incoming business in both the second quarter and six months was ahead of last year's bookings, he added. "With a generally favorable economic outlook and a record number of new product introductions, we expect 1977 bookings to exceed those of any previous year," he said.

NCR's expenditures for research and development for the first six months were $55.8 million, an increase of 31% over the $42.4 million spent in the first half of last year. For all of 1977, R&D expenditures are expected to reach $120 million.

•CDC Earnings Rise 26%

MINNEAPOLIS — Control Data Corp. reported consolidated earnings of $14.6 million or 85 cents a share for the second quarter of 1977, a 26% gain over the $11.6 million or 67 cents a share in the year-ago quarter.

This figure included earnings of $9.8 million from CDC's Commercial Credit subsidiary.

Computer business revenues for the second quarter were $369.8 million, up 10% from $335.1 million for the same period in 1976.

For the six months, CDC's earnings rose 21% to $26.3 million or $1.52 a share compared with $21.7 million or $1.25 a share in the year-ago period.

Half-year revenues reached $708.0 million compared with $641.7 million in the first six months of 1976.

William C. Norris, chairman, noted that CDC continues to experience improved business across a broad range of computer-related products and services. As a result, second-quarter computer business earnings totaled $4.8 million vs. $2.8 million for the second quarter of 1976.

Computer services were a particularly strong contributor to the improved second-quarter results, Norris added. In particular, data services revenues, aided by a number of new products, grew 22% compared with the same quarter a year ago.

Earnings in the third quarter may not show an increase over last year's 87 cents a share, he noted, because of the particularly strong results in the computer business in last year's comparable quarter.

Nickels & Dimes

Centronics' board of directors approved a 5-for-4 stock split in the form of a 25% stock dividend payable Oct. 4 to holders of record Aug. 29. A cash dividend of 25 cents a share payable on all shares outstanding after the split, including the new shares, was also voted.

$$$

Wyly again extended the expiration date of the exchange offer for its 7-1/4% convertible subordinated debentures due 1995 and its 4% convertible subordinated sinking fund capital notes due 1983. The new expiration date is Sept. 30.

$$$

Raytheon declared a quarterly dividend of 25 cents a share payable July 27 to holders of record July 8.

$$$

AVX has declared a quarterly dividend of 8 cents a share payable July 28 to holders of record July 8.

Acquisitions

Itel Corp. has acquired **Facts Nationwide Teletype, Inc.**, a privately held DP company that provides industry information to coin dealers throughout the U.S. Itel has also purchased the **Margin Monitor System** and operations from Bank Computer Network Corp.

Alanthus Corp. has agreed to acquire all of the outstanding stock of **MI2 Corp.**, a manufacturer of data communications equipment, from Motorists Development Co., a subsidiary of Motorists Mutual Insurance Co.

EG&G, Inc. has agreed in principle to acquire **Quality Measurement Systems, Inc.** The transaction will involve an exchange of EG&G common stock for all the outstanding shares of Quality stock.

Automatic Data Processing, Inc. (ADP) has completed the previously announced acquisition of **First Data Corp.** for 302,345 shares of ADP common stock.

NLT Computer Services Corp. has signed an agreement to purchase the Washington, D.C., Memphis, Tenn., and Beloit, Wis., offices of Analysis and Programming Corp. of Greenwich, Conn.

U.S. Datacorp has acquired certain assets as well as the commercial computer output microfilm business of **Trusco Datacorp**, a division of the Trust Co. of Georgia.

Datatrol, Inc., a subsidiary of Applied Devices Corp., has purchased inventory, tooling, capital equipment, patents and rights to the **Amcat** product line of terminals and systems from Addressograph Multigraph.

Pertec Computer Corp. has acquired **Mits, Inc.** The agreement calls for the exchange of 746,154 shares of Pertec common stock for the approximately 966,900 shares of Mits currently outstanding.

System Development Corp. has acquired the **Stockmaster Division** of Space Application Corp.

W. Ardis Lowrey, chairman and president of Digital Development Corp., has acquired the stock holdings of two minority shareholders and thus has become the sole owner of **Digital Development**, a San Diego-based disk memory manufacturer.

Horiba Instruments, Inc. has acquired the **Vehicle Emission Computer Systems** business of Interautomation.

Informatics, Inc. has acquired **Management Horizons Data Systems, Inc.** from FNCB Capital Corp., a subsidiary of Citicorp.

IF YOU HAVE AN ASCII TYPING OR CRT TERMINAL...

You Can Have Sophisticated Word Processing For Less Than $10,000

If you are using CRT or Diablo™/Qume™ terminals, you can add sophisticated word processing at a remarkably low price. The ACS SA-400 will transform your dumb terminal into a brilliant word processor with no complicated interfacing. Important features include:

- Composing and Editing Formatted Pagas
- Industry Defined Automatic Proofreading
- Mainframe Communications and Unattanded Printing
- Global Search and Replace (Bidirectional)
- Cut and Paste, Outlining, Personalized Form Letters
- Automatic Page Headers and Footnotas

For information about word processing modules or systems, write or call today.

Survey of Industrial Firms

Micro Use Seen Growing, Diversifying

FRAMINGHAM, Mass. — Microcomputers have proven their worth to industry and in the future will become much more prevalent — and not necessarily only as dedicated control devices, according to market research involving industrial manufacturing firms.

The survey, conducted by the Nigberg Corp. here, sought to measure attitudes toward micros in a broad range of industrial markets, ascertain how micros are typically evaluated and highlight attitudes towards specific micro features.

On a base of 494 respondents, 60% indicated they were currently using micros and 17% said they were planning to use them.

Of these respondents, 30% indicated they were proficient in microcomputer design from the ground up and 22% indicated they were proficient in system design. Only 5.3% expressed no familiarity with micros at all, according to Nigberg.

The most popular reasons for using micros in a product were to reduce cost and increase product capability, the survey found.

Microcosm

Eight-five percent of the micro users develop software for their systems in-house, primarily because they feel they do a better job, Nigberg said. Assembly language was far and away the most popular programming language used (57.1%).

When evaluating new microcomputer equipment, 73.1% of the respondents indicated that two to four people were involved. A large task force of five or more people evaluates microcomputer equipment in only 14.4% of the responding companies, while close to 12% of the respondents indicated that a single individual conducts the evaluation, the survey showed.

Given the criteria of price, the specific application, equipment brand name, reliability and performance, the most likely criteria for recommending purchase were specific application and performance, rating 47.8% and 22.5% respectively, Nigberg found.

Other research findings were: price is not the most important factor in micro evaluation; micros are not necessarily best used with a larger host computer; low-cost memory is an important factor in the growth of the microcomputer; modular expansion is important; and micros should have their own high-level langauge developed for use in applications.

NEC Has Thimble Printers

LEXINGTON, Mass. — NEC Information Systems, Inc. has introduced a line of character printers, utilizing a "thimble" printing element, that print a 128-char. set at up to 55 char./sec.

The thimble elements last about 50% longer than many wheel-type printers, according to the firm.

The Spinwriter series includes five models, all of which are microprocessor-controlled.

Features include a choice of five standard interfaces, 10- or 12-pitch characters, Ascii compatibility and numerous typefaces, the firm indicated. Custom interfaces are also available.

Model 5510 is a receive-only printer; 5520 a KSR unit; 5530 a word processing unit; 5540 has a split platen; and 5500 is a basic OEM unit.

The Spinwriter features a rotating thimble, electronically driven print hammer and servo motor-controlled positioning system.

The units require no lubrication, NEC said.

In lots of 100, prices for the 5500 through 5540 range from $1,140 to $2,600. Deliveries are expected to begin in October from NEC Information Systems at Five Militia Drive, Lexington, Mass. 02173.

Intel Unveils Software

SANTA CLARA, Calif. — Intel Corp. unveiled two software related systems: a real-time control package for SBC 80 and system 80 packaged systems; and a faster mathematics unit.

The RMX/80 real-time multitasking executive is modular and users can link on task modules. The nucleus modules require 2K bytes and contain task-to-task and I/O communication, real-time clock control, interrupt and priority resolution, Intel said.

Bootstrap devices are not required, since all or part of the total program can be stored in erasable programmable read-only memory (Eproms) or read-only memory (ROMs), according to the firm.

Optional modules include a diskette subsystem, a free space manager and a software debug program.

Intel's Intellect Microcomputer Development System supports generation of RMX/80 systems and development and use of a library of task modules, the firm said.

Initially, RMX/80 runs on 8080A-based computers. It costs $1,950 including all modules and a year's free update service, Intel said.

The SBC 310 High-Speed Mathematics unit from Intel's OEM Computer Systems Group enables SBC 80 computers to perform mathematical operations an order of magnitude faster than with microprocessor software, the firm said.

Multiple processors can share the unit via Intel's Multibus.

The SBC operates concurrently to the SBC 80 computers. It costs $595 in single quantity and is a 6.75-in. by 12-in. board assembly, Intel said from 3065 Bowers Ave., Santa Clara, Calif.

Zilog Offers Z80-MCS

CUPERTINO, Calif. — Zilog, Inc.'s Z80-MCS microcomputer system includes the Z80 CPU, a disk controller, 16K bytes of dynamic random-access memory (RAM) and 3K bytes of programmable read-only memory (Prom), which contains basic routines such as system debugger, floppy disk driver, console driver and bootstrap routines.

The unit is in a 19-in. chassis with 600,000 bytes of dual floppy disk storage. It can address 64K bytes of main storage and has an RS-232 or current-loop serial interface, the firm said.

The system cost of $6,000 in single quantity includes documentation covering both hardware and software. Optional software includes Basic and MCS-Rio. MCS-Cobol is scheduled to be introduced in the fourth quarter, the firm said.

Zilog is at 10460 Bubb Road, Cupertino, Calif. 95014.

8X300 Prices Cut

SUNNYVALE, Calif. — Prices have been reduced 40% on the 8X300 microprocessor from Signetics Corp. to $48.75 in quantities of 100 to 999.

The bipolar unit has a fixed instruction set and is optimized for control applications, the firm said.

Typical applications include peripheral controllers, data communications, CRT terminals, power control systems and entertainment devices, the firm said.

Signetics is at 811 E. Arques, Sunnyvale, Calif. 94086.

6800 Gets Floppy

SAN DIEGO — A single or dual floppy disk system for the Motorola 6800 microprocessor is available from Electronic Product Associates, Inc.

The unit is equipped with drive electronics, power supply, controller and exorcisor-compatible interface for the 6800 along with floppy disk operating system, assembler and editor.

The price is $2,595 for the single drive and $3,295 for the dual-drive system from Electronic Product Associates at 1157 Vega St., San Diego, Calif. 92110.

Portable Console Supports OEM Tests

SANTA CLARA, Calif. — Intel Corp.'s uScope 820 microprocessor system console is a portable system developed to support OEM test and maintenance.

The unit contains an 8085 and initially handles systems based on the 8080A.

Diagnostic routines can be executed while the system under test is running in real-time under control of its own microprocessor, Intel said.

The uScope Probe 8080A is supplied with a keyboard-display overlay and personality read-only memory (ROM).

Intel plans a package of diagnostic routines for the SBC 80/1 and a probe, overlay and ROM set for the 8085 micro and 8085-based single-board computers.

The 820 can be used to monitor, display and alter register memory and I/O values and to control operations including halt, single-step, run with display and run in real-time, Intel said.

The 820 console panel includes hexadecimal as well as binary displays. The entire unit costs $1,520, while the uScope Probe 8080A set costs $480 from the firm at 3065 Bowers Ave., Santa Clara, Calif. 95051.

Intel Adds 8085-Based Units

SANTA CLARA, Calif. — Intel Corp. has brought out lower cost versions of its single-board computers utilizing the 8085 processor as well as other products based on the 8085.

The SBC 80/04 costs $99 in OEM quantities or $195 for one unit and operates on a single +5V power supply.

The SBC 80/05 is priced under $200 in OEM quantities.

The units contain the 8085 processor, whose typical instruction execution time is 2 microsec and can operate as self-contained computers, the firm said.

80P05 Package

Intel's 80P05 prototyping package contains the 80/05 and hardware and software necessary to construct and evaluate OEM processing and control systems with either SBC, the firm added.

In addition, Intel introduced the SDK-85 system design kit, a design and evaluation system for microcomputers based on the 8085.

The kit contains all components necessary to construct an MCS-85 system, including CPU, memory and I/O, the firm said.

Monitor Software

It also includes system monitor software in read-only memory (ROM), an interactive keyboard display and a design library, the firm said.

The kit costs $250 in single-unit quantities and is available through Intel's distributors, the firm said.

In the 80/20-4, Intel has doubled the resident memory on an SBC 80/20, which is based on the 8080A.

4K-bit RAMs

The unit uses 4K-bit static random-access memories (RAMs) and can store up to 4K bytes of data on the RAMs and 8K bytes of program in optional erasable programmable read-only memories (Eproms) or masked ROMs, which are now 16K-bit devices.

The SBC 80/20-4 costs $995 and the standard SBC 80/20 costs $895 in single-unit quantities from the firm at 3065 Bowers Ave., Santa Clara, Calif. 95051.

An equal opportunity employer m/f

LEAD PROGRAMMER ANALYST

To join a manufacturing system project team responsible for implementing a MRP & related manufacturing control systems.

You will be responsible for designing program specifications based on user system design criteria & programming the major elements of the system. This challenging opportunity requires the following qualifications:

- 3-5 yrs systems & programming experience with heavy concentration in manufacturing application software implementation.
- Experience with data base systems, BAL & COBOL.
- Proven trace record of designing & implementing successful systems regarding heavy user interface. Good written & oral communication skills.
- College degree in business administration or computer science desirable.

Clay Adams is a recognized leader in the manufacture of medical equipment. If you meet our qualifications, reply in confidence, including salary requirements, to:

Programmers and Systems Analysts

Our new Manufacturing plant in Salem, N.H., can offer you new opportunities in software applications.

We're looking for experienced programmer analysts and a systems analyst for our new manufacturing facility in Salem, N.H. The people we need are experienced with manufacturing applications in the following areas:

SENIOR PROGRAMMER ANALYST

You'll be in charge of systems design and programming for existing manufacturing cost, labor, and cost analysis systems on the DECSystem 10 in COBOL. New developmental programming will be minimal. You must have 4-5 years systems and programming experience with large scale computers, plus degree in math, computer science or business preferred. Prior COBOL background is essential.

SENIOR PROGRAMMER ANALYST—Materials Planning

We seek an individual with exposure to materials planning and control within a manufacturing system. New developmental programming will be minimal. You should have 4-5 years systems and programming experience with large scale computers, plus math, computer science, or business degree preferred.

PROGRAMMER ANALYST

In this you'll be responsible for implementing the accounts payable, petty cash, personnel, fixed assets, closing systems, and enhancement of the same on the DECSystem 10. New developmental programming will be minimal. Two to four years systems and programming experience with large scale computers and COBOL background are essential. Math, computer science, or business degree highly desirable.

PROGRAMMER ANALYST—Business Products

You will be responsible for the design, development, implementation and user training for manufacturing and marketing management information systems. The hardware/software is a large 11/70 using BASIC PLUS under RSTS/E. Ability to closely relate with non-EDP personnel to accurately define their needs and recommend solutions is a necessity. Will have responsibility for all phases of projects, maintenance of existing systems, setting of programming standards and documentation. This position offers high visibility to management and users. BS or equivalent is required with experience using BASIC and data base techniques.

SYSTEMS ANALYST

You will be responsible for the research, design, documentation, and implementation of an automated information system. This system will support the manufacturing process and related interfaces, i.e., A.P.T. You must have a manufacturing background and three to five years systems and programming experience, preferably using BASIC PLUS. A knowledge of PDP-11 hardware and software is an asset. We also require the ability to communicate clearly with the user community. BS in Computer Science or equivalent helpful.

If you qualify for one of these positions, look into the ground-floor opportunities we're offering in Salem. Send your resume to: Jane Shea, Digital Equipment Corporation, Dept. JS-1, 9 Northeastern Blvd., Salem, N.H. 03079. We are an equal opportunity employer, m/f.

We're the company looking for people.

digital
digital equipment corporation

DATA PROCESSING ANALYST

We need you to:

- analyze and modify our DP personnel system
- determine costs/benefits of new personnel systems
- develop EDP systems for personnel research projects and grants

You must have knowledge of COBOL and (IBM) JCL used for personnel management systems. Knowledge of IMS and FORTRAN is a definite plus. Salary to $19,000.

SYSTEMS ANALYST/PROGRAMMERS

CAREER OPPORTUNITIES IN EDP AUDITING

We are looking for a computer professional seeking a more challenging and rewarding career path in the dynamic field of EDP auditing.

As a Fortune 200 corporation, we offer excellent opportunities for individuals with 4+ years experience in the design, programming and implementation of financial and manufacturing EDP systems in a COBOL environment utilizing IBM 360/370 hardware.

Responsibilities will include reviewing data centers and financial applications to determine the existence and adequacy of controls and to insure data integrity and continued operation; developing programs to test file content utilizing one of the most advanced audit software packages available; reviewing EDP controls at the design stage of a project; and planning and supervising EDP audit assignments.

Ideal candidates will have bachelors degree in business administration or computer science with some accounting and/or auditing courses. Previous EDP audit or financial audit experience a plus. Approximately 35% travel required.

Please submit resume, stating salary history and requirement, to:

EMPLOYMENT MANAGER, DEPT. 725 CW

SCM CORPORATION

299 Park Avenue, New York, N.Y. 10017
An Equal Opportunity Employer M/F

PROGRAMMERS/ ANALYST

2nd NOTICE
SALARY CHANGE

SUNY/EMPIRE STATE COLLEGE is seeking a PROGRAMMER/ANALYST to design educational administrative systems with programming responsibilities under the direction of the Director, Computer Services. Candidates must possess the following qualifications:

—Applications programming experience using CICS/COBOL.
—Debugging 360/370 Assembler Programs and coding in ALC.
—OS/JCL coding experience preferred, but DOS/JCL coding experience acceptable.
—At least five years progressive experience in data processing as a programmer/analyst, or equivalent experience.
—BA/BS degree, or AA/AAS degree in data processing, or the equivalent.

Salary: $15,500-18,900 depending upon background and experience. Interested persons must send letter of application and resume before August 2, 1977 to: Jan Zimmer, Affirmative Action Officer, SUNY/ESC, 2 Union Ave., Saratoga Springs, NY 12866. An equal opportunity/affirmative action employer.

TECHNICAL SYSTEMS SPECIALIST

In view of our upcoming installation of several Hewlett-Packard 3000 Computer Systems that will be driving a nationwide communications network, Spalding, a worldwide manufacturer of sporting goods, is presently seeking creative and results-oriented candidates for a new position as Technical Systems Specialist. This position will include full project responsibilities, and will be located at our headquarters in Chicopee, Massachusetts.

Responsibilities of this position will include the develoment and maintenance of technical systems and procedures in such areas as graphics, datacommunications, and general scientific areas including technical support, guidance, and training as required. Will work with minicomputers, microprocessors, and intelligent terminals. A background in FORTRAN and ASSEMBLER is required, and a BSEE is helpful.

This position offers long term employment and a full line of company-paid benefits including life insurance, medical insurance, investor plan, and tuition reimbursement. Please send resume and salary requirement in total confidence to:

Manager, Manpower Development
Spalding Division of Questor
Meadow Street
Chicopee, Mass. 01013

SPALDING®

A DIVISION OF QUESTOR

Grow with Amdahl and be a part of the future. MVS expertise needed.

Like to shoot dumps? Amdahl needs:

FIELD SUPPORT REPRESENTATIVES

You should have good MVS internals experience and the ability to debug, plus expertise in one of the following areas:

- VTAM/NCP
- V.SAM
- JES 3
- TSO/TCAM

Current openings are in Sunnyvale, California.

Like customer contact? Amdahl needs:

SYSTEMS ENGINEERS

At customer locations. You should have MVS diagnostic expertise and the ability to be a jack-of-all-trades.

Currently there are several openings throughout the United States.

Like to do both of above with travel? Amdahl needs:

HEADQUARTERS SYSTEMS ENGINEERS

To work with Field Engineers at customer locations to solve more difficult bugs.

You should have very good diagnostic techniques preferably with some MVS experience.

Current openings are in Sunnyvale, California.

NO MVS EXPERTISE? Drop us a note anyway. We also have systems engineering openings that do not require MVS experience.

Please direct your response to Amdahl Corporation, 1250 East Arques Avenue, Sunnyvale, CA 94086 and indicate 310-D on your resume or letter. We are, of course, an equal opportunity employer.

amdahl

Software Scientists

We are currently seeking creative individuals who are capable of working with state-of-the-art software technology in developing a systems software environment that will reduce the cost of all phases of software development, from the design phase through the release and maintenance cycle.

These positions will give you the opportunity to contribute to the development of new tools, methods, and procedures, with the goal of adding efficiency to the development process and enhancing project quality.

To qualify, you should be a self-starter looking for substantial technical challenge, and have the capacity to lead and innovate in areas which will influence the development process among diverse groups.

To investigate this position, please forward your resume with salary history to Joe Hart, Digital Equipment Corporation, Dept. B 725, 162 Main St., Maynard, Mass. 01754.

We're the company looking for people.

PROGRAMMERS

General Instrument Corporation's Data Systems and Services Group in Maryland is increasing its professional staff due to expanding requirements in our business of providing uniquely tailored retail point-of-sale, state lottery, off track, and on track wagering systems for a wide variety of customers.

We have immediate openings in:

APPLICATIONS PROGRAMMING

Candidates with at least 2 years experience in assembly and higher level languages for real time, on-line systems are required. Ability to program, debug, install and troubleshoot software on PDP-11, Nova, Varian or similar minicomputer is important.

SYSTEMS SUPPORT

Openings exist in Maryland, Chicago, Detroit and New York for systems personnel to support customers in the field. Responsibilities include defining retail systems specifications, bringing software expertise to the marketing/sales cycle and providing liaison with customers in problem solving and training.

ADVANCED DEVELOPMENT

Individuals with background and potential to develop minicomputer operating systems, real time on and off-line applications, distributed processing techniques, higher level languages, telecommunications and data base management systems are requested to apply.

For the above openings, appropriate degrees are preferred, but significant technical accomplishment is a more important consideration.

Qualified candidates in the listed skills are requested to call Don Parsons, Employment Manager, on our toll free number 800-638-6395 or forward resume and salary requirement in confidence to:

Computer Architects: Good Reasons to Make a Move to Amdahl

Amdahl has a lot to offer good people ready to take a positive step toward upgrading their careers and work environment.

You will find the enthusiasm, excitement, and friendliness contagious. You might even find your work being fun, as most of us do. That's how, in just seven years since our founding, we have earned an international reputation as builder of the most advanced large computer systems. That's how, in just two years since our first shipment, we have delivered a quarter of a billion dollars worth of computers to the world's major companies and institutions. We are, in fact, making historical inroads in an industry where the competition is highly competent.

Our Systems Architecture group seeks talented professionals to help design future high-performance computer systems. You should have a broad educational background in EE or CS with emphasis on computer architecture or design and be familiar with most of these areas: computer systems organization; storage systems organization; operating systems theory; assembler/high-level languages; data base fundamentals. Combined hardware and software experience and familiarity with system 370 is desirable. The following positions represent some of our more immediate needs; perhaps one of them is a good reason for you to make a move to Amdahl.

SENIOR SYSTEMS ARCHITECT

You will be a key decision maker on an architectural team. You have experience in either computer systems or operating systems architecture or design.

CONSOLE AND MAINTENANCE ARCHITECT

You will be responsible for the design of system consoles and work on system maintenance strategies. You have experience or aptitude in most of these areas: small and large computer systems, diagnostics, small operating systems and project management.

STORAGE SYSTEMS ARCHITECT

You will be key in defining the architecture of future storage and data base sub-systems. You have experience in either of these areas.

SOFTWARE SYSTEMS ARCHITECT

You will be a software systems specialist on an architectural team. You have an architectural orientation and experience with operating systems/data base, preferably on system 370.

SYSTEMS ARCHITECT

You will be a member of an architecture team working on diverse investigations. This position offers tremendous educational and advancement opportunities. You have at least 2 years' related experience or the equivalent.

SYSTEM PERFORMANCE ARCHITECT

You will be the performance specialist on an architectural team. You are a qualified professional in computer system performance measurement, evaluation and modeling with emphasis on architecture or design. Research into key areas of new product development will be a major responsibility.

PERFORMANCE MEASUREMENT SPECIALIST

You will be responsible for the development of measurement methodologies to provide the measurement support of future product development. The position requires broad experience and knowledge of computer system operation, measurement methods and system modeling.

WORKLOAD SPECIALIST

You will be responsible for research of computer system workload classification and analysis, including workload creation and synthesis. Research ability in the areas of performance measurement and evaluation is necessary.

We're looking for exceptional talent. You can expect an exceptional compensation and benefits package. Please direct your response to Manager, Professional Employment, Amdahl Corporation, 1250 East Arques Avenue, Sunnyvale, CA 94086. To expedite your application, please indicate 416-E on your resume or letter. We are, of course, an equal opportunity employer.

PROJECT SYSTEMS ENGINEERS.

Aromca needs five Project Systems Engineers who ore the very best available in their field. Your permanent assignment would be in Soudi Arabio where Aramco has projects under woy whose size and scope ore unequolled in the world today.

The job.

You would be working on the world's largest computer automated system for controlling the movement of crude oil, NGL, and notural gas. This system will control the world's largest crude oil pipeline network ond marine terminal and one of the world's largest refineries with the softwore system coordinating Aramco's entire production. It is to be the ultimate in computerized systems for moving petroleum products ond presents to those Systems Engineers who can qualify, the greatest challenge of their careers.

The requirements.

We are looking for engineers who have B.S.E.E. or M.S.E.E. degrees, the lotter being preferred. You must be project-oriented ond have a minimum of 5 years' experience in real time computer systems for the pipeline or process control industries.

Your first assignment will be in Houston for opproximately 18 months working as Aramco's representotive with o mojor contractor who is developing the engineering design proposal. Here you will overview the design and instollotion of all hardware and softwore for the entire project, making sure it meets Aramco's specifications. At the end of the design phase you will then be permanently transferred to Saudi Arabia, where you will oversee the installation, acceptonce testing, and continued operations.

Why work for Aramco?

Besides the challenge and career opportunities of your job, working for Aramco overseas offers severol excellent advantages. You'll receive o good solory and savings plan, plus a generous tax-protected expotriate premium.

And you con travel the world if you wish, becouse on the overoge of every 12½ months you receive 40 fully paid vacotion days, os well as round trip vacotion travel fare to the U.S. Add to this an average of 12 poid holidays each yeor. In addition, Aramco offers a comprehensive medical program and a generous retirement plon, plus excellent recreational facilities.

Interested?

If so, and you're qualified, please write for an application. We'll be back in touch with you as soon as possible.

sales engineers and field analysts

This way to a better future...

Sperry Univac, the name alone is synonymous with quality and this kind of reputation means rewarding opportunities for minicomputer professionals who expect enrichment from their career.

We are committed more than ever to becoming a major force in the minicomputer industry and with our V-77 series computers, which are used in the real-time marketplace for Data Base, Data Communications and Distributed Processing applications, we intend to make that commitment a reality through the hiring of technically-oriented, top professionals.

Our standards are very high, so to attract the caliber of people our product line demands, we offer a great deal more . . . more in areas such as an environment to explore new ideas and applications, or if you're a sale pro, a very aggressive commission plan. We intend to double in size within the next 12 months, so the opportunities to advance into management are almost unlimited. If this sounds like the kind of opportunity you've been waiting for, we suggest you contact the nearest office listed below.

Sales Engineers

We have openings throughout the United States for top closers with a minimum of 3 years experience in the real-time, Data Base, Data Communications and Distributed Processing marketplace. You should have a strong technical command of both hardware AND software, and a successful track record in the minicomputer industry.

Field Systems Analysts

Sperry Univac field analysts have a key responsibility in marketing headquarters interface and sales/proposal preparation and service support. A technical degree is desirable, but creative, problem solvers are a greater asset to our sales force. A minimum of 3 years pre and/or post sales support in real-time commercial (Data Base, Data Communications, Distributed Processing) and/or real-time scientific applications is required.

Marshall Field & Company

CHICAGO
INFORMATION SYSTEMS

Marshall Field & Company seeks qualified individuals to fill a number of expansion programming positions. We currently have installed two Univac 1106-II unit processors. An upgrade to a Univac 1100/82 multi-processor is scheduled for Spring, 1978. This is an opportunity to join a highly professional staff in developing comprehensive retail information systems. In addition to excellent salaries, this program offers good growth potential with a world famous firm.

The following positions are available:

PROGRAMMER ANALYST

Should have a minimum of 2 years experience in business applications using COBOL or ASSEMBLER on Univac Equipment.

SYSTEMS SOFTWARE PROGRAMMER

Should have a minimum of 2 years experience with large scale operating system software. Experience with Communications software or File Management systems is also desirable.

Please send resume, including salary requirements and references to:

**D.J. Spapperl
Manager, Systems Development
Information Systems Division, 10MW
Marshall Field & Company
111 North State Street

Director of Corporate Systems

Booz Allen & Hamilton continues its growth in the management consulting industry. Our rapid expansion has created an opening in our Corporate Internal Financial Group, located in north central New Jersey, for a Computer Systems Professional interested in enhancing our development through the conceptualization and introduction of a centralized corporate systems capability.

The ideal candidate should have extensive experience in the development of business systems including key resource management, marketing, and finance — which should be coupled with a varied hardware background including mini computers. In addition, it is vital that your communications skills be considered an asset to the Systems Development process.

This position is designed to have a significant impact on our internal management systems and offers a compensation package equal to that task.

Please forward your resume in confidence to: R.W. Apple
